Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Bars.—Fresh inquiry for mild steel bars is unusually heavy. New buying is dragging, though it is somewhat heavier than a week ago. The price situation in this market has changed only in a slight widening of the circle of preferred buyers. Forward contracting is going forward on the basis of 2.05c. a lb., Chicago. Forge shops in this area are laying plans for November output, and, as schedules now stand, the consumption of bars in that month will show some improvement over the current rate. Consumption of bars by builders of farm machinery is on the upturn. Railroad needs of iron bars for the fourth quarter are normal, as gaged by contracts already signed. Prices are steady at 2.05c. a lb., Chicago. The alloy bar market is steady in sales and shipments, and output remains at 70 per cent of capacity. Forward contracting in rail steel bars is gaining headway, though many users still prefer to buy at close range. Mills are having considerable trouble in trying to meet the exacting deliveries expected by buyers.

Bolts, Nuts and Rivets.—Total specifications for these products in the third quarter fell measurably short of the tonnages taken out in the first and second quarters. September started poorly, but in recent days releases have been growing and shipping schedules for October give promise of further improvement. Much of the betterment comes from farm implement manufacturers, who are going into production on tractors for export and who are entering into production on new lines of machinery which are taken by the trade in the spring and summer months.

Coke.—By-product foundry coke demand is steady and prices are firm at $8 a ton, local furnace.

Railroads Seek Reopening of Steel Rate Case

WASHINGTON, Oct. 1.—Railroads in Official Classification territory today filed a petition with the Interstate Commerce Commission asking for reopening of the Eastern general steel rate case. Reconsideration is specifically sought regarding five of the findings in the commission's decision, the effective date of which recently was postponed to Dec. 20 from Oct. 20 at the suggestion of the carriers.

The railroads claim that the scales prescribed would reduce their revenues in Official Classification territory by at least $2,500,000 annually and that other losses would result.

Sheet Mill Plant Expansion

Central Alloy Steel Corporation has authorized an expenditure of over $600,000 for improvements to its plants at Massillon and Canton, Ohio. The entire sheet rolling mill plant at Massillon will be equipped with continuous pack and pair furnaces and electric driving equipment will be installed. A new continuous furnace was recently constructed and similar equipment for the remaining four mills will be added. These improvements are expected to result in 40 per cent greater output of automobile body sheets. A normalizing furnace designed by the company's engineering and metallurgical departments will be installed at Canton. This will be 100 ft. long and 9 ft. wide.

Industrial Steel Treating Co., manufacturer of industrial furnaces and heat treating equipment, has removed to Sixth and Fallon Streets, Oakland, Cal.

Warehouse Prices, f.o.b. Chicago

	Base per Lb
Plates and structural shapes	3.10c

New York

New York Central Inquires for 200,000 Tons of Rails—Bank Building Takes 15,000 Tons of Steel

NEW YORK, Oct. 1.—Pig iron sales for the week totaled 10,000 tons, of which about one-quarter was for shipment from Alabama. Prices on Southern iron are steadily growing firmer, with sellers holding to a minimum of $13.50, base Birmingham, on foundry grade. It is conceded that as low as $13 might still be quoted on attractive tonnages of stock iron of low silicon content. Most melters in this territory have covered for at least a substantial part of their fourth quarter requirements and their is no inclination to place any further tonnage for first quarter. A quieter market, therefore, seems to be in immediate prospect. Shipments, however, are going forward with virtually no interruption, and foundry melt is rather well sustained, being largely unaffected by the decline in automobile manufacture. Prices on eastern Pennsylvania foundry iron range from $18.50 to $19, base furnace, and on Buffalo foundry grade from $17.50 to $18, base furnace. Barge shipments from Buffalo, which have been heavy in the past six weeks, may decline in view of an impending increase in the grain movement and the possibility of higher rates. The Port Henry, N. Y., furnace, which has been out for repairs, is expected to be blown in by Oct. 15. The Worthington Pump & Machinery Corporation is in the market for 1600 tons of various grades for its Harrison, N. J., Holyoke, Mass., and Elmwood Place, Ohio, plants. The New York Central Railroad is inquiring for 350 tons for delivery to Frankfort, N. Y., or Elkhart, Ind.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Cast Iron Pipe.—Quotations are still irregular, but Northern foundries are maintaining prices at a slightly higher level than for some weeks, quoting from $32 to $34 a ton, foundry, on most of the current business. Buying is limited to lots of a carload to a few hundred tons. Providence, R. I., has awarded 200 tons of 12-in. water pipe to the United States Pipe & Foundry Co. Municipalities are planning additions to their water supply, which should provide some fair tonnages of pipe for spring delivery. Authorization of bond issues or appropriations for water supply expansion have recently been made by Briarcliff Manor, N. Y., North Caldwell, N. J., and Danbury, Conn. Among recent private purchases of cast iron pipe is an order for about 400 tons placed by the American Construction & Securities Co. with a Southern maker for export to Cuba.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—The volume of orders has dropped off somewhat and inquiries also are less numerous. Prices are holding fairly well, although in a few cases foreign steel has been sold at less than the current market.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—Although steel bookings by local offices during September were generally larger than those of August and larger also than September orders last year, the steel situation lacks the snap to which the trade had grown accustomed during the earlier months of the year. Fourth quarter contracts for bars have generally been revised to the basis of 1.90c., Pittsburgh. Although the Pittsburgh price on shapes is also off $1 a ton, this does not materially affect the Eastern situation, which is based on the price of material at Bethlehem, Pa., in which no change has been reported. Sheet prices, while not quotably lower, are uncertain. The open price on black sheets is 2.85c., Pittsburgh, but quotations of 2.75c. have appeared on desirable business. On galvanized sheets, 3.50c. is the usual price, as some mills which have been holding for 3.60c. have abandoned efforts to obtain above 3.50c. Light-gage blue annealed sheets are steady, but on the heavy gages quotations of 2.10c., Pittsburgh, are fairly common. The New York Central will receive bids up to Oct. 9 on 200,000 tons of steel rails for its 1930 requirements. Railroad car buying continues to be a promising prospect, but expected inquiries are slow in coming out. The Farmers Loan & Trust Building, New York, will take 15,000 tons of structural steel, which has been awarded to the McClintic-Marshall Co. Two new subway sections in New York call for a total of 17,000 tons, on which bids will be received the last week of October. In export trade, the placing of 60,000 base boxes of tin plate by the Nippon Oil Co. for shipment to Japan was outstanding. The business was divided among five makers.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Warehouse Business.—Buying from stock was fair during September. Black, galvanized and blue annealed sheet prices are still subject to concessions of $1 or more a ton. Zinc sheet quotations have been advanced 25c. a 100 lb. to a range of 10.75c. to 11.25c. a lb. for No. 9 in casks.

Coke.—Demand for heating coke is increasing with the approach of cold

weather, but standard furnace grade is unchanged at $2.65 to $2.75 a net ton, Connellsville. Special brands of beehive foundry coke are quoted at $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Brokers filling No. 1 heavy melting steel contracts with eastern Pennsylvania mills have reduced their buying prices to $15.50 a ton, delivered, at which price a plentiful supply is reported. Shipments are being made to Bethlehem, Steelton, Conshohocken, Pa., and Claymont, Del. No. 2 heavy melting steel is being bought at $13.25 a ton, delivered to a Harrisburg, Pa., mill, and at $13 a ton, delivered Phoenixville, Pa. Buying prices of steel car axles, specification pipe and chemical borings are also off about 50c. a ton, and forge fire is about 25c. a ton lower in price.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.00 to $12.85
Heavy melting steel (yard)	8.00 to 9.50
No. 1 hvy. breakable cast.	10.25 to 11.00
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.75 to 8.00
Short shoveling turnings..	8.00 to 8.50
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles.....	19.00 to 19.50
Iron car axles.....	23.00 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.25
Forge fire	9.50 to 10.00
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.25 to 13.75
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	9.50 to 10.00

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	14.50
No. 2 cast (radiators, cast boilers, etc.)	14.00

Cleveland

Price Weakness Follows Reduction in Mill Backlogs—Two Large Automobile Plants to Shut Down Temporarily

CLEVELAND, Oct. 1.—The fourth quarter has started with mill backlogs much reduced on some products and wiped out on others. Now that some of the mills are in actual need of orders, a tendency toward price weakness is apparent in some lines. While a few fair-sized orders were placed by Michigan automobile companies during the week, the revival of that industry apparently will not come for several weeks.

Two of the leading makers of low-priced automobiles that have already reduced production to bring out new models are scheduled to shut down their plants this month, one for two to four weeks and the other for 30 days. These suspensions indicate that the automobile output in October will fall considerably below that of any recent month. Some of the motor car builders are preparing to get under production on new models about Nov. 1, but the indications are that this industry will not get under operation at more than a moderate pace during the remainder of the year.

Galvanized sheets have again weakened and concessions are appearing on black sheets. It seems probable that automobile body sheets will be definitely established for the quarter at 4c., base, or a $2 a ton reduction. Concessions are reported on wide hot-rolled strip. Wire rods have definitely settled to $40, Cleveland. There has been some shading by one outside mill to 1.90c., Cleveland, on steel bars to meet local mill competition. The Cleveland base on cold-finished steel bars has been reduced $1 a ton.

Pig Iron.—Sales declined the past week, but inquiry showed a little gain. Cleveland interests sold 21,000 tons of foundry and malleable iron during the week. Many foundries in the automotive industry have not purchased iron for the last quarter, possibly because of the uncertainty as to the extent of their operation during the remainder of the year. Shipments during September were slightly heavier than in August, but are expected to fall off this month because of reduced shipping orders from automotive foundries. Consumers in other fields are taking iron at a good rate. Only two or three inquiries have come out for first quarter contracts, and no sales are reported for that delivery. A Columbus, Ohio, foundry is inquiring for 2000 tons of malleable iron for the remainder of the year. Other inquiries, all for foundry grades, include 350 tons from the New York Central Railroad, 600 tons from Tiffin, Ohio, and 500 tons from Erie, Pa. The market is firm at $18.50, Cleveland, for out-of-town shipment; $19, furnace, for local delivery, and $20, Lake furnace, for shipment in the Michigan territory.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$19.50 to 20.00
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Shipments of Lake Superior ore continued at a high rate through September, the movement by water during the month, with one dock estimated, having been 9,547,000 tons. Water shipments to Oct. 1 amounted to 53,264,000 tons.

Rails and Track Supplies.—Orders for rails for the Chesapeake & Ohio, Pere Marquette and Hocking Valley railroads were closed during the week, and aggregated 79,257 tons. [For distribution see rail paragraph, Chicago market report.] Negotiations are under way for track accessories to go with these rails. The Chesapeake & Ohio alone will buy 8000 tons of tie plates.

Semi-Finished Steel.—Specifications against contracts for sheet bars, billets and slabs have further declined, and the leading local producer has nearly caught up on orders. This company is still operating 13 of its 14 open-hearth furnaces. Most consumers have closed fourth quarter contracts at $35, either Cleveland, Youngstown or Pittsburgh.

Wire rods are now commonly quoted at $40, Cleveland, attempts to get $42 apparently having disappeared. Some contracts are being closed for the fourth quarter.

Sheets.—As some of the mills have become more in need of orders, the market shows increasing signs of weakness on all grades but blue annealed, on which there has not been much of a market test recently. Concessions to 4c. on automobile body sheets in Detroit are reported, and it is expected that that will become the established price before the end of the week. While some of the mills report no difficulty in getting 2.85c. for black sheets, business has been taken at 2.75c. Galvanized sheets have further weakened and can be bought at 3.50c., Valley, equivalent to 3.40c., Pittsburgh. Specifications continue light.

Strip Steel.—Specifications for both hot and cold-rolled strip are light, and production has been materially reduced. Large buyers in the automotive field are not making extended future commitments because they are uncertain of their requirements during the rest of the year and apparently also because they expect to secure more favorable prices. Concessions to 1.80c. are reported on wide strip, but narrow material and bands are firm. Most cold-rolled strip mills need orders. This product is quoted at 2.75c., Cleveland, except for small lots.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes.....	3.00c.
Soft steel bars.....	3.00c.
Reinforc. steel bars.....2.25c. to	2.50c.
Cold-fin. rounds and hex.....	3.65c.
Cold-fin. flats and sq.....	4.15c.
Hoops and bands, No. 12 to ¼ in., inclusive	3.25c.
Hoops and bands, No. 13 and lighter	3.65c.
Cold-finished strip .....*5.95c.	
Black sheets (No. 24).....3.70c. to	3.90c.
Galvanized sheets (No. 24).4.60c. to	4.75c.
Blue ann'l'd sheets (No. 10).....	3.25c.
No. 9 ann'l'd wire, per 100 lb.....	$2.80
No. 9 gal. wire, per 100 lb.....	3.25
Com. wire nails, base per keg.....	2.80

*Net base, including boxing and cutting to length.

Wire Products.—Specifications are light and new business is confined to small lots. Some car lot sales are being made at 2.40c. for wire and at $2.45 a keg for nails.

Cold-Finished Steel Bars.—Producers have reduced the Cleveland base on cold-finished steel bars $1 a ton to 2.30c. There are now four basing points with the same price, Pittsburgh, Cleveland, Chicago and Buffalo. Those northern Ohio consumers who have been buying on a Pittsburgh base will now get the benefit of the reduced Cleveland base. Some fourth quarter contracts that have been written at 2.35c. will be revised to the new base. Specifications continue light.

Bars, Plates and Shapes.—Specifications continue rather light. The curtailment of the automotive industry has resulted in a decided falling off in the demand for steel bars. Local forge shops engaged in automotive work are operating at greatly reduced capacity. Plates and structural material are in fair demand. Some of the builders of road machinery have curtailed production, but steam shovel makers continue at capacity. Local mills need tonnage in steel bars, and the 1.90c., Cleveland, price has become more common for out-of-town shipment. This price in some cases has been met by an outside mill. However, considerable fourth quarter contracting has been done at 1.95c. Plates and structural shapes appear firm in this market at 1.95c., Pittsburgh.

Coke.—A 25c. a ton price advance on by-product nut coke for domestic use to $4.50, ovens, has been announced by one Ohio producer, effective Oct. 1. Egg coke remains at $4.75. Foundry coke is quiet, with prices unchanged. Ohio by-product foundry coke is quoted at $8.25, ovens.

Old Material.—Shipments of steel making scrap to some of the mills in the Youngstown and Canton districts were held up during the week. As a result, Youngstown dealers have withdrawn from the market and prices in that district are weak. Locally, the market continues dull and weak. Shipments are still restricted by local mills and dealers are buying small lots to fill outstanding orders. In the absence of transactions most quotations are unchanged. Compressed sheet steel has declined 50c. a ton.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$15.25 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	15.00 to 15.50
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.50
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.25 to 10.50
Mixed borings and short turnings	10.25 to 10.50
No. 2 busheling	10.25 to 10.50
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.50 to 19.00
Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Bars, Shapes and Black Sheets Lower—Radio and Automobile Parts Makers Curtail Operations

PHILADELPHIA, Oct. 1.—Downward revision of $1 a ton on steel bar contracts in eastern Pennsylvania, following the change in the Pittsburgh district, has not yet been made, but the change to 1.90c., Pittsburgh, is expected in a few days. Meanwhile, the shape market has shown a softer tendency, although business continues moderately active and fabricators are well engaged. Black and galvanized sheet prices are lacking in firmness and sellers of high finished sheets are developing an increasing tendency to use 2.75c., base Pittsburgh, in figuring extras. Plate prices show no change, mills being fairly well engaged and looking forward to a fair demand for plates from shipbuilders and the railroads.

Allocation of 310,000 tons of rails for the Pennsylvania Railroad will be made on Oct. 10 and 200,000 tons for the New York Central Railroad on Oct. 9. Railroads continue active buyers of small tonnages of material. Steel axles and other car materials were recently placed with an eastern Pennsylvania mill by the Pennsylvania Railroad.

Pig Iron.—Foundry iron buying for fourth quarter delivery has not been extensive, some consumers having sufficient on hand, or due on contracts, to carry them temporarily, and others prefer to cover only for short periods under present market conditions. Southern foundry iron is still being sold to consumers in this district, but the total of such tonnage is diminishing. About 2000 tons of foundry iron was recently purchased by a Flemington, N. J., consumer from an eastern Pennsylvania steel company furnace. About 1000 tons of foundry iron for the American Engineering Co., Philadelphia, has not yet been closed. Basic iron is inactive, except for the purchase of a carload by a steel company in eastern Pennsylvania, which normally uses scrap, but occasionally buys limited quantities of basic as a substitute for stove plate.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Few contracts have been closed for the last quarter, as consumers in most cases have fair stocks, and in certain instances have not fully specified their third quarter commitments. Quotations are unchanged at $35 a ton, Pittsburgh, for rerolling billets and $40, Pittsburgh, for forging quality.

Bars.—Action of some mills in revising bar contracts to 1.90c., Pittsburgh, or 2.22c., delivered Philadelphia, has not yet been followed generally in eastern Pennsylvania, but the change is expected in a few days. Sellers here are inclined to believe that 1.90c., Pittsburgh, will apply on contracts and on orders for a carload or more of bars, but 1.95c., Pittsburgh, or 2.27c., Philadelphia, will continue to be quoted on less than carload business, which makes up a considerable part of the present buying activity.

Reinforcing Bars.—Prices of billet steel bars are unchanged at 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, with no extra for cutting to length. Rail steel bars are quoted at 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length, but actual transactions are at concessions from this price to meet the competition of billet steel bars. The new hospital for the Women's Medical College,

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Philadelphia, requiring 400 tons of bars, has been awarded to the Roslyn-Gilmore Steel Co., and rail steel bars will be used.

Shapes.—Although a sizable tonnage of business is being booked and shape mills are able to maintain about 80 per cent operations, prices at which business has recently been taken show a range from 1.90c. to 2c., f.o.b. nearest mill to consumer, or 1.96c. to 2.06c., delivered Philadelphia.

Plates. — Mills are operating at about 80 per cent of capacity and, with continued shipbuilding activity and railroad buying in prospect, are maintaining plate prices at 2.05c., Coatesville, or 2.15c., delivered Philadelphia. Contracting for last quarter delivery by plate consumers has not been heavy, but in the few cases that contracts have been made, 2.05c., Coatesville, has been maintained.

Sheets. — With consumption of sheets considerably less than available capacity, mills are seeking tonnage, and both black and galvanized sheet prices show a lack of strength. Local automobile manufacturers have curtailed their sheet buying and the leading radio manufacturer in this district has curtailed output greatly, at the same time requesting postponement of deliveries on contracts for sheets and other materials. Black sheets are still quoted at 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia, but desirable business has been placed at concessions of $1 or $2 a ton. Recently, mills selling high finished sheets have been inclined to add finishing extras on a black sheet base of 2.75c. a lb., Pittsburgh. Galvanized sheets are still quoted by some mills at 3.60c., Pittsburgh, or 3.92c., Philadelphia, but business is rather generally at 3.50c. to 3.55c., Pittsburgh, or 3.82c. to 3.87c, delivered Philadelphia. Blue annealed sheets continue at 2.25c. to 2.35c., Pittsburgh, or 2.57c. to 2.67c., Philadelphia, for No. 13 gage and 2.10c. to 2.20c., Pittsburgh, or 2.42c. to 2.52c., Philadelphia, for light plates, blue annealed, No. 10 gage.

Imports.—In the week ended Sept. 28, 7227 tons of chrome ore arrived at this port, of which 3180 tons was from Portuguese Africa, 2347 tons from South Africa and 1700 tons from Greece. Steel arrivals consisted of 15 tons of structural shapes, 20 tons of steel hoops and 20 tons of steel scrap from the United Kingdom, 3 tons of drill steel and 2 tons of wire rods from Sweden and 78 tons of structural shapes from Germany.

Old Material. — Prices of most grades of scrap are unchanged, but the tendency of the market is toward lower levels, and, when new contracts are made, downward revision of prices would not be unexpected.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.00 to $16.50
Scrap T rails	15.50 to 16.00
No. 2 heavy melting steel	12.50 to 14.25
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	14.50 to 14.75
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

International Derrick Buys Boykin Company

International Derrick & Equipment Co., Columbus, Ohio, has purchased the capital stock and manufacturing plant of the Boykin Machinery & Supply Co., Beaumont, Tex., which has been reorganized as a subsidiary company of the former under the name of the International Derrick & Equipment Co. of Texas, with Harry M. Runkle, Columbus, as president; B. Boykin, Jr., Beaumont, vice-president and general manager; and L. L. Powell, Houston, Tex., secretary and treasurer.

A new steel foundry and office building, as well as other structures, are being added to the Beaumont plant. The International company also owns the Houston Galvanizing & Plating Co., Houston, which has begun construction of a structural and galvanizing plant for production of the company's tower and metal building line.

The Boykin Company has manufactured rotary drilling equipment for many years, while the International Company makes a large line of rust-resisting steel products for the oil, gas, artesian well, power and aviation industries, as well as steel buildings, electrical power transmission equipment, railroad towers and building equipment, airway and airport towers, forest observation towers, hangars and other aeronautical products.

Sheffield Metallurgists at National Metal Congress

One of the features of the National Metal Congress and Exposition held in Cleveland, Sept. 9 to 13, was the presence of a large number of men who were either born or obtained their early training in Sheffield, England. Many of them have made notable contributions to the science and advance of steel metallurgy in different lines. Among these were the following:

Dr. George B. Waterhouse, now professor of metallurgy, Massachusetts Institute of Technology, Cambridge, Mass.; Charles K. Everitt, managing director, Edgar Allen & Co., Sheffield; Sidney Grayson, president, Jessop Steel Co., Washington, Pa.; Frank Hodson, president, Empire Steel Castings, Inc., Reading, Pa.; J. Kent Smith, consulting metallurgist, and associated with Climax Molybdenum Co., Detroit; Allwyn Wild, president Rustless Iron Corporation of America, Baltimore; Victor F. J. Tlach, president, Darwin & Milner, Inc., Cleveland; Oliver Smalley, consulting metallurgist, New York, and associated with Jessop Steel Co., Washington, Pa.; F. C. A. Lantsberry, William Jessop & Sons, Sheffield; George Batty, director of the Steel Castings Development Bureau, Philadelphia; Frank W. Brooke, chief engineer, William Swindell Brothers, Pittsburgh; T. Holland Nelson, consulting metallurgist, Philadelphia.

Withdraws from Boat Operation

Stewart Furnace Co., Cleveland, owner of a blast furnace at Sharon, Pa., will withdraw from the Lake transportation business in which it has long been engaged. It has sold its four Lake boats, which have been operated by Harvey H. Brown & Co., an affiliated interest, to the Youngstown Steamship Co., which is owned by the Youngstown Sheet & Tube Co. The ore boats of the Youngstown Steamship Co. are operated by Pickands, Mather & Co.

Revised New York Building Code May Allow Welding

Provisions that the allowable unit stress of steel structures be increased from 16,000 to 18,000 lb. a sq. in. and that welding be permitted under strict regulations in the construction of steel buildings have been recommended for inclusion in the proposed new building code being drafted by the City of New York. Recommendation also is made that the use of special alloy and high-carbon steels be permitted as rapidly as their qualities can be ascertained and specific silicon and nickel steels already on the market are named as acceptable.

The findings were made jointly by the subcommittee on structural steel and iron and the subcommittee on materials, loads and stresses of the Merchants' Association of New York. The subcommittees point out that adoption of these recommendations will result in a decrease of from 2 to 5 per cent in the cost of building.

Increases in industrial employment in the seventh Federal Reserve district during the period July 15 to Aug. 15 were about as large in the aggregate as the losses of a month earlier. Gains of 0.7 per cent in the number of workers and 3.9 per cent in payroll offset the declines of 0.2 and 5.0 per cent respectively, recorded for the preceding period. The metals and metal products group almost entirely recovered the loss reported in the previous month.

Birmingham

Pig Iron Sales Decline as Fourth Quarter Needs Are Well Covered—Steel Buying Fairly Good

BIRMINGHAM, Oct. 1.—Sales of pig iron to district consumers are beginning to ease off as the volume of fourth quarter requirements under contract approaches 75 per cent. Apparently buyers are still following the policy of covering part of their quarterly requirements and placing repeat orders from time to time as their needs are more clearly defined. Sales of Birmingham iron in competitive territories have also dropped. Inquiries for first quarter iron in outside districts have not begun to develop, and furnaces here make no predictions as to the extent they will compete in other markets for first quarter iron. The margin of shipments over output widened during the last half of September, and it is estimated that more iron was shipped during the month than in any previous month this year. The price situation is stronger. For district delivery, $14.50 for No. 2 foundry is reported quite firm. There have been no changes in furnace operations in the past three weeks. Of the 13 active furnaces, eight are on foundry and five on basic iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—New orders during the last week of the third quarter showed a slight increase over those of the preceding week and compared favorably with any week since early August. Backlogs are as large now as they were 30 days ago, and perhaps larger. Shipments are steady. Inquiries for wire products are stronger, and further improvement is expected in October. Tentative plans call for the opening of the Ensley rail mill by the third week in October. With this mill back in operation, finished steel mill operations in the district will be close to the peak of the year. The new plant of the Pullman Car & Mfg. Corporation at Bessemer is being placed in operation today. Effective in the last quarter, black sheets were reduced $1 a ton to 3c. All other prices are the same. New business of structural steel fabricators in September was lower than in any of the previous six or seven months. Current orders are mostly under 100 tons each. Prospects are reported good for an increase in tonnage during October. Fabricated plate work is at the low point of the year, with the October outlook reported only fair. The total of active open-hearth furnaces has remained at 17 for the past three weeks. The Tennessee company is working seven at Fairfield and four at Ensley. The Gulf States Steel Co. has all six in operation at Alabama City.

Cast Iron Pipe.—Scattered carload orders predominate in the pressure pipe market. Orders above 200 tons are rare. Most of the business is coming from outside points, the tonnage up for figures in the Southern territory being the lightest in several months. The American Cast Iron Pipe Co. has booked a few orders of 100 to 200 tons each for shipment to the Pacific Coast. Inquiries for next year have not begun to develop. Prices remain at $37 to $38 a net ton, Birmingham, on 6-in. and larger sizes.

Coke.—Contract requirements for foundry coke are moving freely. Sixty additional by-product ovens were placed in operation last week by the Semet-Solvay Co. Of the 1380 ovens in the district, less than 10 are idle.

Old Material.—A gradual improvement in steel grades during September has placed these lines in a fairly good position. Iron scrap has been without improvement, and prices have been reduced 50c. a ton on No. 1 cast and $1 a ton on tramcar wheels. Other prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Boston

Pig Iron Sales Light—Demand for Scrap Declines and Prices Are Weaker—Steel Buying Falls Off

BOSTON, Oct. 1.—Pig iron sales the past week continued light. The largest was 1000 tons of malleable at the equivalent of $17.50 a ton, Buffalo. The next largest sale was 500 tons of No. 1X Mystic iron to the Westinghouse Electric & Mfg. Co., Springfield, Mass. A New York furnace competed actively for this order, and it is understood the seller had to make a price concession to obtain the business. Competing furnaces are now quoting prices equivalent to $17.50 a ton, base Buffalo. Buffalo stacks are cautioning foundries that rail and water freights probably will expire on or before Nov. 1. The Mystic Iron Works management announces that, contrary to common report, its furnace is not to be relined within the near future.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Bars, Shapes and Plates.—Mill representatives report a falling off in the demand for bars, shapes, plates and steel products in general. The bar price situation has become unsettled.

Reinforcing Steel.—Current buying of billet steel bars is confined to small tonnages at 2.66½c. a lb., base, from stock. Large tonnages hanging over the market for several weeks apparently are no nearer closing than a week ago. The market for rail steel bars is quiet at 2.26½c. a lb., delivered common Boston freight rate points.

Coke.—The movement of by-product foundry coke from ovens to consuming plants is not so heavy as heretofore. So far, there has been little if any stocking by foundries for the winter. The price remains at $11 a ton, delivered within a $3.10 freight rate zone.

Warehouse Business.—For the second time within a month, wire nails have been cut 10c. a keg. The warehouse price is now $3.30 a keg, base. The demand for iron and steel, while more active than it was a month ago, is not so large as expected.

Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Cast Iron Pipe.—The United States Pipe & Foundry Co. was the low bidder on 250 tons of 12-in. pipe for Providence, R. I. No award has been made. Ayer, Mass., on Sept. 30 closed bids on 7800 ft. of 6 and 8-in. pipe. Westfield, Mass., will close bids on Oct. 12 for several thousand feet of pipe for a water supply extension. A Massachusetts utility company is feeling out the market on a large tonnage, presumably for 1930 requirements. The market for small pipe is steady, but concessions are still available on large dimensions. Prices quoted openly on domestic pipe are: 4 in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12 in., $40.10 to $41.10; 16 to 20 in., $39.60. A $4 differential is asked on Class A and gas pipe. During September 842 pieces of French pipe were received at Boston.

Old Material.—Demand for most grades of old material is limited and prices are unsettled. Steel turnings are an exception. A week ago sales were reported at $6.60 a ton, on cars shipping point, but $7 is the lowest price today, and supplies at that figure are not excessive. In contrast, there has been a further shrinkage of 25c. a ton on No. 1 heavy melting steel, and long bundled skeleton has dropped 50c. a ton since a Worcester, Mass., consumer ceased buying. Brokers see no indication of improved scrap this month.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$11.00 to $11.50
Scrap T rails	10.50 to 11.00
Scrap girder rails	10.00 to 10.50
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	7.00 to 7.25
Cast iron borings (steel works and rolling mill)	6.50 to 6.75
Bundled skeleton, long	9.00 to 9.50
Forge flashings	9.50 to 10.00
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.50
Shafting	13.50 to 14.00
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.50 to 10.00
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.75 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.00 to 18.50

St. Louis

10,000 Tons of Basic Pig Iron Sold—Improvement in Demand for Steel Products—Scrap Weak

ST. LOUIS, Oct. 1.—The principal pig iron transaction of the week was the sale of 10,000 tons of basic iron to a district melter by the St. Louis Gas & Coke Corporation, which sold an additional 3250 tons of iron, including 2000 tons of foundry, to a district stove manufacturer, 650 tons to an Illinois implement maker and 400 tons to an Illinois equipment builder, all for shipment during the remainder of the year. Sales of Southern iron have slowed up some. The market is firmer, makers generally being satisfied with the state of their backlogs. October shipments of the local maker are expected to exceed 34,000 tons.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—An improvement is reported in new business and specifications against contracts. The Granite City Steel Co. is operating all of its rolling mills, except the plate mill, at 100 per cent. Plate rollings are at 75 to 80 per cent of capacity. Demand for galvanized sheets for roofing purposes is fairly good. Tin plate buying also is good. The structural trades report business quiet, with no large contracts in sight. Wire and wire products are fairly active.

Coke.—Sales of domestic grades of coke by the Granite City by-product ovens are ahead of production, dealers showing increasing interest. Foundry coke is in good demand, and smelters are taking their full quotas of furnace coke.

Old Material.—The market for old material is quiet. The only sale of consequence was a tonnage of miscellaneous rails at $16.75 and specialties at $19 to an East Side consumer, but this buyer later cut its prices. Heavy railroad offerings and shipments from country dealers tend to depress the market. The latter movement is slowing up considerably as the result of reduced prices. Miscellaneous standard-section rails, rails for rolling, and stove plate are off 25c. a ton. Iron car axles are up $1. Railroad lists: Pennsylvania Railroad, 58,000 tons; Missouri Pacific, 4500 tons; St. Louis-San Francisco, 1900 tons; Nashville, Chattanooga & St. Louis, 500 tons; Chicago, Milwaukee, St. Paul & Pacific, 600 tons.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.00 to $14.50
No. 2 heavy melting or shoveling steel	13.25 to 13.75
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand-sec. rails including frogs, switches and guards, cut apart	16.00 to 16.50
Railroad springs	18.00 to 18.50
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	16.50 to 17.00
Machine shop turnings	7.50 to 8.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	12.75 to 13.25
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Youngstown

Valley Mills Operating At Less Than 80 Per Cent—Declining Demand Brings Out Price Concessions

YOUNGSTOWN, Oct. 1.—The steel industry in the Valleys enters the fourth quarter with operations on a hand-to-mouth basis on all products with the possible exception of pipe and with an operating rate of less than 80 per cent. The schedules of sheet mills are best, averaging from 90 per cent to capacity, while other products range from 60 to 70 per cent.

Curtailment in the demands of automobile companies is the principal reason for the sharp decline during September, as other consuming industries are still taking steel at a fair rate, and there is no indication of any marked curtailment during the last three months of the year.

Comparatively high operations in the pipe mills are a bright spot in the picture. One large producer expects a record run in its pipe department during October, while the maker of the electrically welded products is securing more than enough business to keep its mill constantly occupied. Curtailment in tin plate operations has not been so great as might be expected for this time of the year, and, with buying for the next season less than a month away, the situation is rather satisfactory. Reduced operations in the strip mills has been accomplished largely by longer suspensions over the week-ends and mills are securing enough week-to-week business to keep both the hot and cold-rolled departments busy for the greater part of the week. The average operating rate for the district is approximately 75

per cent. Bar business is not so good, with the operations probably lower.

In the face of reduced demand for steel, a buyers' market has developed. One reason for the delay in fourth quarter contracting is a deadlock over prices. Buyers of steel recall that in previous years price weakness usually followed declining demand, and mills are having difficulty in convincing them that this time is to be an exception. Developments in the last two weeks indicate that buyers are gradually gaining the advantage. Sheet prices in general are weak. Youngstown mills still adhere to a quotation of 3.60c., Pittsburgh, on galvanized sheets, but this price is not holding. The usual $2 concession to jobbers is being extended to the trade by large makers at nearby points. Weakness in galvanized material may also have some influence on black sheet prices. Valley sheet mills are doing their best to hold the price of black sheets at 2.85c., Pittsburgh, although large buyers in Michigan are admittedly getting the usual concessions. Light plates, blue annealed, and blue annealed sheets are still fairly well represented at 2.10c. to 2.20c., Pittsburgh, for No. 10 gage and at 2.25c. to 2.35c. for No. 13. The lower figures are not recognized by all sellers. Strip prices are weak, but there has been no open break in the market.

On bars, Youngstown makers are not meeting the Cleveland base, which has declined to 1.90c., and are adhering to 1.95c., Pittsburgh, in quoting on fourth quarter business. This quotation is not bringing in orders, and concessions of $1 a ton are occurring more frequently. A range of 1.90c. to 1.95c., Pittsburgh, is now necessary to include the full list of buyers of this product.

Pig iron prices are holding, and strength was given to the market by the purchase of 5000 tons of basic iron by the American Steel Foundries at Alliance, Ohio, at $18.50, Valley furnace. The foundry grade is quoted at the same level, while malleable and Bessemer are at $19. Buying has been rather light. The scrap market is weak at $17.50 to $18 for No. 1 heavy melting steel and 25c. to 50c. less for compressed sheets.

Buffalo

Steel Backlogs Reduced—Pig Iron Sales Have Declined—Scrap Market Quiet and Prices Are Lower

BUFFALO, Oct. 1.—District foundries are purchasing only sufficient pig iron to supply their nearby needs, in consequence of which business has fallen off considerably. Most of the furnaces could book more tonnage for the rest of the year, although their backlogs are considerable, and in one instance just sufficient to take care of regular customers' excess requirements. The sales of Buffalo furnaces in New England have eased off. Considerable Buffalo iron is being shipped to Milwaukee and Chicago.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Old Material.—Conditions are quieter than they have been at any time this year. Mills which have experienced some decrease in operation have become cautious about extended purchasing. No. 1 heavy melting steel is bringing no more than $17 to $17.50, with the chances good that a tonnage could be purchased at a lower figure.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:		
No. 1 heavy melting steel	$17.00 to	$17.50
No. 2 heavy melting steel	14.75 to	15.00
Scrap rails	16.50 to	17.00
Hydraul. comp. sheets	14.50 to	14.75
Hand bundled sheets	12.00 to	12.50
Drop forge flashings	14.25 to	14.50
No. 1 busheling	15.50 to	16.50
Hvy. steel axle turnings	14.00 to	14.50
Machine shop turnings	8.00 to	8.50
No. 1 railroad wrought	13.00 to	13.50
Acid Open-Hearth Grades:		
Knuckles and couplers	19.00 to	20.00
Coil and leaf springs	19.00 to	20.00
Rolled steel wheels	19.00 to	20.00
Low phos. billet and bloom ends	20.00 to	20.50
Electric Furnace Grades:		
Short shov. steel turnings	12.50 to	13.00
Blast Furnace Grades:		
Short mixed borings and turnings	11.50 to	12.25
Cast iron borings	11.00 to	12.00
No. 2 busheling	10.00 to	10.50
Rolling Mill Grades:		
Steel car axles	18.75 to	19.25
Iron axles	21.00 to	22.00
Cupola Grades:		
No. 1 machinery cast	16.00 to	17.00
Stove plate	13.00 to	13.50
Locomotive grate bars	12.50 to	13.00
Steel rails, 3 ft. and under	19.50 to	19.75
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Industrial	18.00 to	18.50
Railroad	18.00 to	18.50
Agricultural	18.00 to	18.50
Special Grades:		
Chemical borings	12.50 to	13.50

Finished Iron and Steel.—The Lackawanna plant of the Bethlehem Steel Co. is operating 21 of 24 open-hearths. Its Bessemer department is down. Donner Steel Co. is operating five to six open-hearths. Steel backlogs are being reduced. The Courier-Express Building will require 800 tons of structural and 240 tons of reinforcing bars. A local fabricator has contracted for 185 tons for a grade crossing elimination for the New York Central Railroad at Rome, N. Y. Another contract placed was 325 tons of structural steel for a Buffalo apartment house. Warehouse business is reported to be holding up very well.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Canada

Substantial Volume of Pig Iron Business

TORONTO, ONT., Oct. 1.—With the opening of fourth quarter, Canadian pig iron melters are showing more interest in placing contracts for iron to be delivered in the next three months. Producers are carrying a large volume of future business on their books. The daily iron melt is well sustained, and there appears little possibility of a slump in the immediate future. No curtailment in production has been made by Canadian blast furnaces. Pig iron prices are steady.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—Although new business is on a smaller scale than that of two or three months ago, tonnages are appearing in substantial volume. Contracts placed during the week ranged from 50 to 3000 tons.

Old Material.—New business is increasing. Improvement is noted in both spot sales and future contracts. The current demand continues to favor iron grades, although steel lines are improving in some localities. Despite the fact that old material prices have been sliding downward in many districts across the international boundary, Canadian prices are holding at their recent levels.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel borings	7.50	6.50
Wrought pipe	6.00	6.00

No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

The Carnegie Steel Co. has purchased a Freyn-Design continuous stock-line recorder for use at its blast furnace plant at South Duquesne, Pa.

Pacific Coast

Demand for Steel Products Continues Steady—Building Activity Increases—Pending Work Fairly Large

SAN FRANCISCO, Sept. 28 (*By Air Mail*).—Movement of iron and steel products continues on a fairly even keel. Outstanding among the week's orders were 1650 tons of structural shapes for a pulp plant in Everett, Wash., for the Puget Sound Timber & Pulp Co., placed with the Isaacson Iron Works, and 1000 tons of plates for the same interest for boilers and tanks, taken by the Puget Sound Machinery Depot. Pending business includes 2000 tons of reinforcing bars for approaches for the St. John's River bridge, Portland, and 5500 tons of cast iron pipe for Long Beach, Cal.

Building activity on the Pacific Coast during the past month has shown a healthy increase. The work of erecting the structural steel for the Southern Pacific bridge over the Carquinez Straits will be begun within a few days. Several new structures are planned in San Francisco, among them a 20-story office building on Montgomery Street.

Pig Iron.—Sales and inquiries continue to involve unimportant tonnages. Foundry operations lag. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Pending business in reinforcing steel calls for nearly 5000 tons. Bids have been opened on 170 tons for a courthouse at Olympia, Wash., and bids will be opened on Oct. 16 for a bridge over the San Luis Rey River, Sacramento. The price structure continues unchanged at 2.30c., base, and 2.40c., base, in San Francisco and Los Angeles, respectively, on carload lots, and at 2.60c. and 2.70c., respectively, on smaller tonnages. Mild steel bars are firm at 2.35c., c.i.f.

Plates.—In addition to the 1000 tons for a pulp plant, mentioned above, the Puget Sound Machinery Depot took 400 tons for six locomotive boilers for the Great Northern Railroad at Seattle. After some delay, a pipe line at Bremerton, Wash., involving 200 tons, was finally awarded to James Coyne, who in turn sublet the fabrication to an unnamed interest. The only pending project of importance involves 140 tons for two syphons at La Mesa, Cal., bids on which will be opened Oct. 7. While the general quotation on plates continues at 2.35c., c.i.f., this price has been shaded in several instances on large and desirable tonnages.

Shapes.—Among the structural lettings were 185 tons for a store in Oakland, taken by the California Steel Co.; 850 tons for a conveyor frame at Azusa, Cal., for a dam, booked by the Consolidated Steel Corporation, and 100 tons for a theater in Stockton, placed with the Pacific Coast Engineering Co. Important pending projects involve 350 tons for a sugar warehouse in San Francisco, 405 tons for a bridge over the Trinity River and 1337 tons for a bridge over the San Luis Rey River, both in California. No change in quotations has occurred, 2.35c., c.i.f., remaining firm.

Cast Iron Pipe.—While pipe lettings are not heavy, pending business aggregated several thousand tons. Whittier, Cal., placed 109 tons of 4-in. Class B pipe with the American Cast Iron Pipe Co. Bremerton, Wash., which had an inquiry out for 875 tons of 4 to 24-in. Class B pipe, cancelled the inquiry and purchased riveted steel pipe. San Diego, Cal., rejected bids on 144 tons of 4 and 6-in. Class B pipe for Plata Avenue and on 201 tons of 4 and 6-in. Class C pipe for El Prado Avenue. The Butterfield Construction Co. was low bidder on 460 tons of 4 to 8-in. Class B pipe for Chesterton Street, San Diego. Bids have been opened on 5585 tons of 4 to 12-in. Class B pipe for Long Beach, Cal. Azusa and San Diego, Cal., are calling for bids on 110 tons of 4 and 6-in. Class B pipe and on 230 tons of 4 and 6-in. Class C pipe, respectively.

Warehouse. — Out-of-stock distributers report business well sustained. Price changes have recently been announced in the bay district. Plates and structural shapes are now quoted at 3.40c.; small angles, 3/16-in. and over, have been raised from 3.15c. to 3.40c.; small channels and tees, ¾ in. to 2¾-in., are now quoted at 3.90c.; spring steel, ¼-in. and thicker, is 5.10c.; structural rivets, ½-in. and larger, are 4.50c.; black sheets, No. 24 gage, blue annealed sheets, No. 10 gage, and galvanized sheets, No. 24 gage, are being quoted at 5.00c., 4.00c. and 5.40c., respectively.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¾-in. and over	3.15c.
Small angles, under ¾-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Cincinnati

Demand for Pig Iron Falls Off — Weakens in Scrap Market — Domestic Coke Shipments Larger

CINCINNATI, Oct. 1.—With foundries reported to have curtailed operations and automotive manufacturers displaying less interest in purchases, demand for pig iron in this district has receded sharply. In the past week sales were less than those of the preceding week, agents reporting that approximately 4500 tons in small lots was placed. The largest order was for three cars of foundry iron to be delivered to a southern Ohio consumer. Buyers, generally, are not showing any great interest in covering for fourth quarter requirements, but are purchasing as needs arise, although in some instances they are anticipating their needs about 30 days. Some foundries are reported to be carrying over a fair surplus of iron which was purchased the latter part of the second quarter in anticipation of a continued heavy demand from their customers during the third quarter. But a slight lull produced a surplus which will carry them into the fourth quarter. While none of the business placed was sufficient to test prices, the Northern iron brought about $18.50, base Lake furnace, and the Southern was placed at prices ranging from $13.50 to $14.50, base Birmingham. Among the orders for the week were three cars of silvery sold on the present schedules. The trade is entering a new quarter without any inquiry for pig iron.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—While the automotive demand for sheets has not increased greatly, other consumers who have been taking sheets in small quantities during the summer months have

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb.	8.75

	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.00
4-in.	33.00
Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

sharply increased their specifications. District operators report that a gradual increase in operations will take place within the next 10 days. Although the fabricated material market is still firm, new business is sluggish.

Coke.—The movement of foundry coke during September was not so good as during August. Prices on by-product foundry coke will continue at about $10.05, delivered, in Cincinnati. With the advent of cooler weather, the movement of domestic coke is a trifle better, one oven representative reporting that a fair tonnage of this grade was shipped during the week into the Detroit area.

Old Material.—The softening in prices of old materials in other markets is being reflected in this district. Heavy melting steel and No. 2 wrought have been reduced to $13.50 to $14, and dealers expect that this weakness will spread to the entire market unless mill operations increase soon. The supply of material is larger than it was recently.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.50 to $14.00
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.00 to 9.50
Machine shop turnings	8.25 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.50 to 14.00
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Detroit Scrap Declines

DETROIT, Oct. 1.—The market on old material in the district has been very quiet during the past week, with few purchases of tonnage size. Busheling, flashings,' sheet clippings and turnings have declined 50c. a ton during the past week.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	8.50 to 9.00
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.00 to 12.50
Old No. 1 busheling	10.50 to 11.00
Sheet clippings	8.25 to 8.75
Flashings	12.50 to 13.00

Globe-Wernicke Co. and Unit Steel Co. Merged

Merger of the Globe-Wernicke Co., Cincinnati, and the Unit Steel Co., Dayton, Ohio, is confirmed by officials of both companies. John C. Haswell, president of the Dayton company, said that the Unit Steel Co. plant would be moved to Cincinnati. The Globe-Wernicke Co. manufactures office furniture and equipment and the Steel Unit Co. produces steel doors and partitions.

Concrete Bar Industry Adopts Trade Rules

Secret Rebates, Price Discrimination and Other Alleged Unfair Practices Are Condemned

WASHINGTON, Oct. 1.—The Federal Trade Commission has approved five and accepted 13 rules as expressions of the trade in connection with the trade practice conference of the reinforcing steel fabricating and distributing industry held at Asheville, N. C., on April 18. The rules as passed upon by the commission were made public last Thursday. The rules approved are designated as "Group I" and apply to unfair methods of competition. Those accepted as expressions of the trade are classified under "Group II."

"Group I" rules relate to inducing breach of contract; misbranding; secret rebates; discrimination in price and commercial bribery. "Group II" rules relate to a definition of the industry, circulation of current price lists; manner of submitting bids for each job; dumping; arbitration; standard forms of contract for sales; departure from original agreements with respect to terms of discount for cash; discriminatory prices; reduced price in event of a market decline; uniform method of cost finding; proper marketing and grading; and provision that the trade practice conference be made a continuing organization to act for progressive elimination of unfair and uneconomic trade practices in industry.

Some of the rules adopted are as follows:

GROUP I

Any willful attempt to induce a breach of any existing bona fide contract, or to prevent the performance of any contractual duty or service under any bona fide contract for the sale of reinforcing materials, is an unfair method of business.

The marking or branding of reinforcing materials (or any misrepresentation in connection with the sale of such materials) for the purpose or with the effect of misleading or deceiving purchasers with respect to the quantity, quality, grade substance, or origin thereof, is an unfair method of business.

The payment or allowance of secret rebates, refunds, credits, unearned discounts, whether in the form of money or gifts, the acceptance of securities at more than true market value, or otherwise, as a means of effecting or concealing price discrimination, or the extending to certain purchasers of special privileges, including discriminatory allowances for engineering, architectural or other services, not extended to all purchasers under like terms and conditions, are unfair methods of business.

Any discrimination in price for reinforcing materials between purchasers for the same grade, quality or quantity of product sold, after making due allowance for differences in cost of fabricating, servicing, selling, transportation and credit risks, or unless made in good faith to meet actual established competition, is an unfair method of business.

GROUP II

The entering into of contracts for reinforcing materials without actual obligation of the buyer to purchase any specified quantity or quantities, or for any particular jobs, for the purpose of securing to the buyer a special price, is condemned by the industry.

The industry approves the practice of each individual member of the industry independently publishing and circulating his own current price lists, and also notices of all advances, declines or other changes in price.

The industry approves the policy of each member submitting on each job a single bid based on individual costs and other factors deemed relevant by each firm or company, and of revising the quotation on any job only in the event of changes in plans or specifications as tending to place the industry in line with more businesslike merchandising methods in other progressive industries, and with accepted methods of bidding on Government contracts, and any violation of this policy is condemned by the industry.

The practice of dumping surplus stock outside of regular markets, at low discriminatory prices, is condemned by the industry.

The industry approves the settlement of controversies between members of the industry and those dealing with the industry by arbitration under the prevailing code in the industry.

The industry approves the policy of adopting standard forms of contract for sales, with clearly written and commonly understood provisions fair to both buyers and sellers, as tending to avoid controversy and to promote businesslike methods of distribution.

Any departure from original agreements with respect to terms of discount for cash or time of payment which results in discrimination between purchasers of the same class and under the same conditions is condemned by the industry.

Where several different concrete reinforcing materials are bid on at the same time, or for the same job, failure to quote a separate price on reinforcing bars and spirals, on wire mesh, on permanent and removable forms, and on other separate or unrelated products sold in connection with such materials and on the erection thereof or other labor to be performed thereon, or the making of the acceptance of any separately priced item in a quotation contingent upon the acceptance of another such item, where the purpose or the effect thereof is to secure to a buyer a discriminatory price, is condemned by the industry.

Contracts of sale which permit the buyer to cancel or provide for a reduced price in the event of a market decline, and which do not permit the seller to cancel or provide for an enhanced price in the event of a market rise, are lacking in mutuality and tend to induce controversy and breach of contract, and are condemned by the industry.

It is the judgment of this industry that an accurate knowledge of costs is indispensable to intelligent and fair competition, and the general adoption of accurate and uniform methods of cost finding and estimating as a means of correcting the various unfair practices heretofore mentioned is strongly recommended.

All contracts for the purchase or sale of reinforcing materials shall clearly state the quality and grade of such materials, and the quantity, or job on which the material is to be used, and any violation thereof is condemned by the industry.

Non-Ferrous Metal Markets

Copper Situation Favors Producers—Zinc and Lead Steady—Tin Declines

NEW YORK, Oct. 1.

Copper.—There are several factors in the market which give strength to the position of producers. In the first place, neither domestic nor foreign consumers have overbought, despite the unprecedented purchases early in September. They had refrained from placing orders for several months in an effort to break prices and when they finally came into the market they merely made up in part for the volume of business which ordinarily they would have contracted for in small quantities at frequent intervals. The fact that few bookings for December delivery have been made bears out this statement. Domestic shipments of copper in September were second only to the peak month of March, which is proof that users actually were in need of large tonnages to meet current needs rather than merely speculating in futures. Moreover, it is conservatively estimated that consumers will have to buy 200,000 tons to fill their requirements over the remainder of the year. Through recent purchases, consumers have got back into a normal position from a tonnage standpoint, but foreign users still are somewhat underbought. Fifty-eight thousand gross tons of copper was sold for export during September. Demand during the past week was of fair proportions, with electrolytic copper firm at 18c., delivered in the Connecticut Valley. The Lake copper market has been steady, with consumers buying at a moderate rate at 18c. to 18.12½c., delivered. The quotation of Copper Exporters, Inc., is 18.30c., c.i.f., usual European ports.

Copper Averages.—The average price of Lake copper for August, based on daily quotations in THE IRON AGE, is 18.12½c., delivered New York. The average price of electrolytic copper is 17.75c., refinery, or 18c., delivered in the Connecticut Valley.

Tin.—The Straits tin market was fairly active the first two days of the past week, when about 500 tons was sold for spot and October shipment. Some consumers had tin tendered to them on previous contracts and, since they were not in a position to use it, they resold it. Today the monthly tin statistics came out, showing a decrease of 1844 tons in the world's visible supply. Normally, such a favorable report should result in a firm market, but this development was off-

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

Rolled Products

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) .. 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.75c.
Lead, wide	11.35c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—		
High brass	21.12½c.	to 22.12½c.
Copper, hot rolled, base sizes	27.75c.	to 28.75c.
Copper, cold rolled, 14 oz. and heavier, base sizes	30.00c.	to 31.00c.
Seamless Tubes—		
Brass	26.00c.	to 27.00c.
Copper	29.12½c.	to 30.12½c.
Brazed Brass Tubes	29.12½c.	to 30.12½c.
Brass Rods	18.87½c.	to 19.87½c.

New York Warehouse

Delivered Prices, Base Per Lb.

- *Zinc sheets (No. 9), casks* ..... 10.75c. to 11.25c.
- *Zinc sheets, open* ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 47.00c. to 48.00c.
- Tin, bar ..... 49.50c. to 50.50c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 19.00c.
- Zinc, slab ..... 7.75c. to 8.25c.
- Lead, American pig ... 7.62½c. to 8.12½c.
- Lead, bar ..... 9.62½c. to 10.12½c.
- Antimony, Asiatic ..... 11.00c. to 11.50c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) .. 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 30.00c. to 31.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 50.25c.
- Tin, bar ..... 52.25c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 7.75c. to 8.00c.
- Lead, American pig ..... 7.55c. to 7.75c.
- Lead, bar ..... 9.75c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.75c.
- Babbitt metal, high grade ..... 54.00c.
- Solder, ½ and ½ ..... 31.25c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	15.00c.	16.50c.
Copper, hvy. and wire	14.75c.	16.00c.
Copper, light and bottoms	12.75c.	14.00c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.50c.	6.00c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

set by an estimate that Straits tin shipments during October will amount to 10,000 tons. If this estimate proves true, a new monthly record will be established. The reaction to this news came in the form of a bad break on the London market, with prices falling to £200 2s. 6d. for spot standard tin, £203 7s. 6d. for future standard, and £204 12s. 6d. for spot Straits. The Singapore market also was adversely affected, with quotations at £210 5s. The unfavorable London situation was reflected today in spot Straits tin at New York, which dropped to 44.25c.

Lead.—Consumers have been placing a fair volume of business for October shipment, but little inquiry has appeared for November delivery. Producers are looking forward to buying on a wider scale later in the month. Prices at St. Louis are steady and unchanged at 6.70c. and the leading interest is maintaining its contract price at 6.90c.

Zinc.—Although purchases have been confined to small tonnages for early delivery, sellers are of the opinion that the market from their standpoint is the strongest in many weeks. This is due partly to the fact that production has been curtailed and partly to the fact that consumers have exceedingly slim stocks on hand and therefore must place some orders soon. In the Tri-State district, 75 per cent of the mines have been shut down the past week. Since the first week of September the weekly output of ore has averaged from 13,000 to 13,500 tons. Sales in the past seven days, at 9820 tons, were about 1000 tons below those of the previous week. Producers are quoting 6.80c., East St. Louis, for prime Western zinc, but at least a small amount is available at a lower figure.

Antimony.—There has been a further recession in prices, with spot metal quoted at 8.50c., New York. Consumers, however, are unwilling to place orders at that figure and are offering 8.25c. The decline in the price of silver, which affects the rate of exchange of the Chinese metal, is largely responsible for the downward movement of quotations.

Nickel.—Ingot nickel is quoted at 35c. a lb. in wholesale lots, shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 1. — The market started dull in the opening days of the week, but recently sales have mounted to a satisfactory volume. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 45.75c.; lead, 6.80c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.60c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Norfolk & Western Orders 2000 Cars, Boston & Maine 1500

ORDERS for freight cars in the week totaled 3700, of which 2000 are for the Norfolk & Western, 1500 for the Boston & Maine and 200 for the Lehigh Valley. In addition, an unconfirmed report is that the Louisville & Nashville has bought 1000. Orders for nearly 1000 car bodies were placed by two roads.

Locomotive orders included 42 for the New York Central, 17 for the Chilean State Railways and 14 for the Great Northern. The Pennsylvania is inquiring for 75.

With 7000 cars to be bought by the Baltimore & Ohio, probably 6000 by the Chesapeake & Ohio, upward of 2700 by the Burlington, nearly 6000 by the Santa Fe, 4000 by the Southern, and 1900 by the Chicago & North Western, car purchases now definitely in sight total about 30,000 units.

Details of the week's business follow:

Baltimore & Ohio is expected to come into the market soon for 7000 cars.

Louisville & Nashville is reported to have placed orders privately for 1000 cars, but this is not confirmed.

Norfolk & Western has ordered 2000 all-steel hopper cars, of which 1000 will be built by Bethlehem Steel Corporation and 1000 by Ralston Steel Car Co.

Great Northern has ordered 14 locomotives from Baldwin Locomotive Works.

New York Central has placed an order with American Locomotive Co. for 42 electric locomotives for use in New York City. Some weeks ago New York Central placed a similar order for 35 locomotives.

Seaboard Air Line has ordered 465 box car bodies from Standard Steel Car Co.

Lehigh Valley has ordered 200 hopper cars from Bethlehem Steel Corporation.

Boston & Maine has ordered 1000 box cars and 500 hopper cars from Standard Steel Car Co.

United Fruit Co. is inquiring for 100 fruit cars and 80 superstructures for fruit cars.

International Railways of Central America are expected to come into the market for 75 stock cars, 50 box cars, 50 flat cars, seven first-class passenger coaches, 15 second-class coaches, three baggage cars and five locomotives.

Chicago & Eastern Illinois has ordered 500 gondola car bodies from Mount Vernon Car & Mfg. Co.

Monongahela Connecting Railroad will buy one to four six-wheel locomotives and one to four eight-wheel locomotives.

Pennsylvania will buy 75 4-8-4 type locomotives.

Chilean State Railway has ordered 17 locomotives from Baldwin Locomotive Works.

It is understood that the Chesapeake & Ohio Railroad will be in the market shortly for 4000 hopper cars of 57½-ton capacity and 2000 box cars.

Great Northern has ordered three electric locomotives from General Electric Co.

Burlington directors have authorized purchase of 500 automobile, 600 flat, 800 hoppers, 10 baggage, 14 suburban and 10 gas-electric cars; also eight Mikado locomotives and five passenger engines. Authorized for its subsidiary, the Colorado & Southern, are 700 box and 100 flat cars.

Chicago & North Western to Buy New Equipment

WASHINGTON, Oct. 1.—Authority has been granted by the Interstate Commerce Commission to the Chicago & North Western Railroad to issue $8,775,000 in trust certificates to be used in the purchase of 1000 steel underframe automobile cars, 10 locomotives, 400 steel underframe gondola cars, 15 gas-electric motor passenger-train cars, 300 steel underframe flat cars, 200 steel ballast cars and 10 steel baggage cars. Equipment to be acquired under an agreement made in January consists of 1000 70-ton gondola cars and 25 locomotives.

Application was filed with the commission last week by the Baltimore & Ohio Railroad for authority to issue equipment trust notes of $13,500,000 to be used as a part of a total of $18,173,000 for the purchase of equipment, some of which has been ordered or is under negotiation. The equipment includes 2000 70-ton steel gondola cars, 2000 70-ton steel hopper cars, 3500 50-ton all-steel box cars and 50 all-steel passenger coaches.

Merger of Car Builders Said To Be in Progress

Reports are persistent that negotiations are under way for a union between General American Tank Car Corporation and Pullman, Inc. Officials of the two companies refuse to comment on the possibilities of consolidation.

Pullman, Inc., through its subsidiary, the Pullman Car & Mfg. Corporation, has an annual manufacturing capacity of 22,000 freight cars and 1800 passenger cars. The company is also engaged in the manufacture of car wheels and has a large car repair business. More than 8000 parlor and sleeping cars are operated by another subsidiary, the Pullman Co.

General American can produce 18,000 cars annually. The company owns and operates 31,000 tank, refrigerator, milk and special cars. This company has recently expanded by the formation of foreign subsidiaries.

Pullman, Inc., and the General American Corporation, as of Dec. 31, 1928, had combined net working capital of $80,000,000. Total assets of Pullman were $305,000,000 and of General American $56,000,000.

Fabricated Structural Steel

Structural Steel Activities Maintained at High Level—Awards Total 50,000 Tons

WITH awards of 50,000 tons and fresh inquiries for 54,000 tons, structural steel activities were maintained at a high level in the past week. Contracts placed for work in New York City accounted for almost half of the total lettings. Apartment, office and hotel buildings and other non-industrial structures will require a substantial portion of the aggregate tonnage. However, more than a third of the steel will go into industrial projects.

The largest award was 15,000 tons for a New York office building. Outstanding inquiries are 17,000 tons for two New York subway sections and 12,000 tons for a Chicago office building. Awards follow:

PROVIDENCE, R. I., 100 tons, bridge, to unnamed fabricator.

NEWPORT, R. I., 100 tons, bank, to J. H. Tower Iron Works.

NEW YORK, 15,000 tons, Farmers Loan & Trust Co. Building on William Street, to McClintic-Marshall Co.

NEW YORK, 1500 tons, apartment house at Madison Avenue and Eighty-eighth Street, to George A. Just Co.

NEW YORK, 800 tons, Grasslands Hospital, to Hinkle Iron Co.

NEW YORK, 2600 tons, apartment building at Eighty-first Street and Central Park West, to A. E. Norton, Inc.

NEW YORK, 2800 tons, apartment building at Seventy-first Street and Central Park West, to Harris Structural Steel Co.

NEW YORK, 600 tons, apartment building at 1068 Fifth Avenue, to Easton Structural Steel Co.

PENNSYLVANIA RAILROAD, 400 tons, bridges, to unnamed fabricators.

PHILADELPHIA, 1500 tons, factory for I. Fischman & Sons, to Bethlehem Fabricators, Inc.

ROME, N. Y., 185 tons, New York Central grade crossing elimination, to McClintic-Marshall Co.

BUFFALO, 325 tons, Lasser-Pryor Co. apartment house, to R. S. McMannus Steel Corporation.

QUEBEC, 100 tons, addition to City Hall, to Eastern Canada Steel Co., St. Malo.

SIMCOE, ONT., 2000 tons, plant for American Can Co., to Hamilton Bridge Co.

TORONTO, 100 tons, machine shop for Dominion Wheel & Foundries, Ltd., to John T. Hepburn, Ltd.

POINT MARION, PA., 850 tons, bridge for Point Marion Bridge Co., to Pittsburgh-Des Moines Steel Co.

SAGINAW, MICH., 1965 tons, building for Michigan Bell Telephone Co., to American Bridge Co., reported last week as 1500 tons.

ONTONAGON, MICH., 165 tons, highway bridge, to Milwaukee Bridge Co.

ALEXANDRIA, IND., 400 tons, Banner Rock Products Co., to Indiana Bridge Co.

ANDERSON, IND., 400 tons, National Tile Co., to Indiana Bridge Co.

CHICAGO, 2300 tons, Parker Junior High School, to Hansell-Elcock Co., local.

EAST CHICAGO, IND., 800 tons, highway bridge at Dickey Place, to Wisconsin Bridge & Iron Co.

ELMHURST, ILL., 300 tons, building for Elmhurst Stone Quarry, to Mississippi Valley Structural Steel Co.

MANITOWOC, WIS., 250 tons, addition to city power plant, to Worden-Allen Co.

MANITOWOC, 5000 tons, oil tanker for Standard Oil Co., to Manitowoc Shipbuilding Co.

JANESVILLE, WIS., 750 tons, bridge, to Milwaukee Bridge Co.

ST. PAUL, MINN., 300 tons, airplane hangars, to St. Paul Foundry Co.

TEXAS OIL FIELDS, 3000 tons, storage tanks for Landreth Co., to Chicago Bridge & Iron Co.

AJO, ARIZ., 500 tons, New Cornelia Copper Co., to Kansas City Structural Steel Co.

OAKLAND, CAL., 185 tons, Heeseman store, to California Steel Co.

CULVER CITY, CAL., 200 tons, stage building for Metro-Goldwyn, to Pacific Iron & Steel Co.

AZUSA, CAL., 850 tons, conveyor frame for work at Azusa dam, to Consolidated Steel Corporation.

STOCKTON, CAL., 100 tons, theater, to Pacific Coast Engineering Co.

EVERETT, WASH., 1650 tons, pulp plant, Puget Sound Timber & Pulp Co., to Isaacson Iron Works.

EVERETT, 1000 tons, plates, boilers, tanks and digesters for Puget Sound Timber & Pulp Co., to Puget Sound Machinery Depot.

TACOMA, WASH., 150 tons, hangar, to unnamed bidder.

BREMERTON, WASH., 200 tons, plates for pipe line, to unnamed bidder.

SEATTLE, 400 tons, six locomotive boilers for Great Northern Railroad, to Puget Sound Machinery Depot.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 200 tons, banking house addition and alterations.

PITTSFIELD, MASS., 150 tons, school.

SPRINGFIELD, MASS., 125 tons, Court House.

NEW YORK, 17,000 tons, subway work; 12,000 tons for section 110, route 107, and 5000 tons for section 3, route 110.

NEW YORK, 1000 tons, public school No. 105 in Bronx.

NEW YORK, 2500 tons, Merchants Square Building at Church and Thomas Streets.

BROOKLYN, 850 tons, building for *Brooklyn Times.*

SCHENECTADY, N. Y., 500 tons, City Hall.

PENSACOLA, FLA., 2500 tons, bridge.

BUFFALO, 800 tons, *Courier-Express* Building.

OTTAWA, ONT., 3500 tons, second block of Government building; Department of Public Works to call for bids during winter.

DETROIT, 1000 tons, building for Detroit Edison Co.

DETROIT, 1500 tons, addition to *Detroit News* Building.

INDIANA HARBOR, IND., 325 tons, bar mill for Inland Steel Co.

CHICAGO, 12,000 tons, estimated, office building for Marshall Field Estate.

CHICAGO, 300 tons, addition to armory.

CHICAGO, 750 tons, addition to 124th Field Artillery Armory.

ST. PAUL, MINN., 400 tons, safety building.

ST. LOUIS, 4500 tons, Merrimac River bridge for Missouri Pacific Railroad.

NORTH BEND, ORE., 400 tons, power house.

LONG BEACH, CAL., 970 tons, auditorium.

SACRAMENTO, CAL., 405 tons, Trinity River bridge; Mercer-Fraser Co., Eureka, low bidder.

SACRAMENTO, 1337 tons, bridge over San Luis Rey River; bids Oct. 16.

SAN FRANCISCO, 350 tons, warehouse for Western Sugar Refinery Co.; bids being received.

SANTOS, BRAZIL, 400 tons, building for Phoenix Utility Co.

U. S. Steel Officials Visit Columbia Properties

SAN FRANCISCO, Sept. 30.—United States Steel Corporation officials, including James A. Farrell, president, and Myron C. Taylor, chairman of the finance committee; E. J. Buffington, president, and T. W. Robinson, vice-president, Illinois Steel Co.; Gordon G. Crawford, president, Tennessee Coal, Iron & Railroad Co.; E. W. Pargny, president, and W. A. Irvin, vice-president, American Sheet & Tin Plate Co., and John S. Keefe, president, and C. F. Blackmer, general superintendent in charge of operations, American Steel & Wire Co., are on a visit of inspection of the properties of the Columbia Steel Corporation at Pittsburg, Cal., and at Provo, Utah.

In San Francisco, Mr. Farrell told newspaper correspondents that their visit was in connection with the pending sale of the Columbia Steel Corporation to the United States Steel Corporation, but that "it was a little too early to discuss the outcome."

The United States Steel Corporation took a 90-day option on the Columbia properties while Mr. Farrell was in Europe recently.

Milling Machine Company Holds Sales Conference

More than 165 persons, representing many foreign countries and every State in the union, gathered on Sept. 27 at an international sales conference at the plant of the Cincinnati Milling Machine Co., Cincinnati. Approximately 12,000 ft. of floor space in one of the company's new buildings was converted into a theater, where each new machine to be demonstrated at the Cleveland show was exhibited to sales representatives. In addition to the display, papers on various subjects pertaining to machine tool manufacture and sales were read.

Hickman, Williams & Co., Inc., 1607 Oliver Building, Pittsburgh, has been appointed exclusive distributer of Clairton nut coke for domestic use. The domestic coke department will be in charge of M. M. Griest, former president of the Pittsburgh-Cambridge Coal Co., Pittsburgh, which has retired from business.

Study of Iron Alloys Started

Committee of Metallurgists Organizes to Carry Out Research of Engineering Foundation

IT was announced by H. Hobart Porter, chairman of the Engineering Foundation, at a dinner at the University Club, New York, on Wednesday evening, Sept. 25, that Dr. George B. Waterhouse, professor of metallurgy, Massachusetts Institute of Technology, will head the Iron Alloys Committee of the foundation.

With the cooperation of industries, engineering societies, universities, and the United States Government, the committee will inaugurate a program of cooperative research called vital to the progress of the American iron and steel industry, whose future, it was declared, will be greatly affected by its ability to maintain a strong position in alloy irons and alloy steels.

The research, the initial stage of which will require five years and cost $150,000, will, it is planned, develop as an international enterprise, coordinating researches in ferrous metallurgy, the most important of which, according to engineers, are going on in America, England and Germany.

Other members of the committee, who will at once begin a critical review of all available literature in English and other languages, resulting in a series of monographs and manuals, were named as follows:

Dr. George K. Burgess, director of the United States Bureau of Standards: Louis Jordan of the bureau, alternate, Washington.

Scott Turner, director of the United States Bureau of Mines; Dr. Charles H. Herty, Jr., alternate, Pittsburgh.

R. E. Kennedy, technical secretary of the American Foundrymen's Association, Chicago.

Dr. H. W. Gillett, director of the Battelle Memorial Institute, Columbus, Ohio.

Prof. Bradley Stoughton, director of the metallurgical engineering department of Lehigh University, South Bethlehem, Pa.

Jerome Strauss, chief research engineer of the Vanadium Corporation of America, Bridgeville, Pa.

T. H. Wickenden, metallurgical engineer of the International Nickel Co., New York.

Dr. John A. Mathews, vice-president of the Crucible Steel Co. of America, New York.

The Iron Alloys Committee, said Mr. Porter, who is president of the American Water Works & Electric Co., will work in cooperation with the American Institute of Mining and Metallurgical Engineers, American Society of Mechanical Engineers, American Society of Civil Engineers, American Institute of Electrical Engineers, American Iron and Steel Institute, Society of Automotive Engineers, American Society for Steel Treating, American Society for Testing Materials, United States Bureau of Standards, United States Bureau of Mines, numerous corporations in the metallurgical industries and several universities. There are encouraging indications, he added, that foreign cooperation also may be arranged. He also is quoted as saying:

> The subject of this committee's work is basic data on iron and its very numerous combinations with other metals and certain metalloids. Extensive as is the use of iron in this "Iron Age," very few persons have ever seen absolutely pure iron. Many thousands of tons of nearly pure iron are used annually for a variety of purposes.
>
> By far the larger proportion, however, of the iron used in the arts is combined with other substances. First are the millions of tons of carbon steels for frames of buildings, for the plates of ships, boilers, tanks and pipes, for rails, in the steam and electric railroads, and for multitudinous other things. Iron castings account for many other thousands of tons. Our industries and engineers have scarcely more than begun to apprehend the possibilities of alloy irons and alloy steels. Nevertheless, progress has been rapid in recent years. Much more information is needed by both producers and users.
>
> The Iron Alloys Committee consequently has accepted as its first duty the very large task of culling from the voluminous literature the essence of useful knowledge and putting it into forms convenient for use by researchers, technologists, engineers and superintendents. Repeatedly, foremost technical leaders in the industries and research institutions have urged this work as the greatest possible aid which the Engineering Foundation, on behalf of the engineering societies, could give to the progress of the iron, steel and related industries in developing alloy irons and alloy steels.
>
> As the second part of its undertaking, the Iron Alloys Committee will aid, promote and organize researches for new basic information about pure iron and its combinations with other substances. It will not attempt to discover or devise commercial alloys; that is the business of the laboratories in the industries. Rather the committee will seek those underlying facts which will be necessary to all the industrial metallurgical laboratories. To conduct this extensive and important project, a committee of distinguished metallurgists has been selected from the several sectors of the field.

Among guests at the dinner, in addition to the members of the committee, there were:

Dr. Edward Dean Adams, honorary member of the foundation; Alva C. Dinkey, president of the Midvale Co.; J. V. N. Dorr, president of the Dorr Co.; Alfred D. Flinn, director of the Engineering Foundation; Dr. Arthur D. Little, president of the Arthur D. Little Co., Cambridge, Mass.; Roy V. Wright, managing editor of *Railway Age*; H. Foster Bain, secretary of the American Institute of Mining and Metallurgical Engineers; Dr. F. M. Becket, vice-president of the Union Carbide Co.; E. A. S. Clarke, secretary of the American Iron and Steel Institute; Calvin W. Rice, secretary of the American Society of Mechanical Engineers; J. V. W. Reynders, consulting engineer, New York.

Reinforcing Steel

Awards Total 5800 Tons—New Jobs Will Take 4200 Tons

CONTRACTS for reinforcing steel bars placed in the past week totaled 5800 tons. Twenty-five hundred tons will go into the construction of the New York State prison at Attica and 1100 tons into a department store at Dubuque, Iowa. Fresh work which came out in the last seven days totals 4200 tons. The largest job is a highway bridge at Portland, Ore., taking 2000 tons. Awards follow:

ATTICA, N. Y., 2500 tons for Attica State Prison, reported placed with Bourne-Fuller Co.

NEW YORK CENTRAL RAILROAD, 115 tons, 241st Street viaduct in New York, to Joseph T. Ryerson & Sons, Inc.

NEW YORK, 250 tons, New York Hospital, to Carroll-McCreary & Co., Inc.

BROOKLYN, 200 tons, post office extension, to Joseph T. Ryerson & Sons, Inc.

PHILADELPHIA, 400 tons, hospital for Women's Medical College, to Roslyn-Gilmore Steel Co.

CHICAGO, 400 tons, apartment building at Fifty-Second Street and Blackstone Avenue, to Inland Steel Co.

CHICAGO, 160 tons, addition to Prairie Farmer Building, to an unnamed bidder.

NOTRE DAME, IND., 400 tons, stadium for Notre Dame University, to Olney J. Dean & Co.

PEORIA, ILL., 100 tons, building for St. Francis Convent, to Laclede Steel Co.

DUBUQUE, IOWA, 1100 tons, department store, to unnamed bidder.

SAN DIEGO, CAL., 100 tons, Army-Navy Academy, to unnamed bidder.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BUFFALO, 240 tons, *Courier-Express* Building.

AKRON, OHIO, tonnage unstated, seven-story building for Firestone Tire & Rubber Co.

AKRON, tonnage unstated, Mayflower Hotel.

AKRON, 800 tons, Polsky department store.

WILMINGTON, DEL., 500 tons, hospital and nurses' home.

CHICAGO, tonnage unstated, addition to Washington Park Armory.

CHICAGO, 350 tons, addition to Michael Reese Hospital.

RIVER FOREST, ILL., tonnage unstated, building for Bowman Dairy Co.

SPRINGFIELD, ILL., tonnage being estimated, 25 institutional buildings for State of Illinois.

OLYMPIA, WASH., 170 tons, Thurston County Court House; bids being received.

PORTLAND, ORE., 2000 tons, approaches to St. John's River bridge; bids opened.

SACRAMENTO, CAL., 128 tons, bridge over San Luis Rey River; bids Oct. 16.

PERSONAL

FREDERICK A. GEIER, president of the Cincinnati Milling Machine Co., was the guest of honor at a dinner in Cincinnati Saturday night, which was the climax of a three-day international sales conference of the Milling Machine company and its subsidiary, Cincinnati Grinders, Inc. Representatives of the company from all over the world, as well as from

F. A. GEIER

every State in the Union, together with leading members of the machine tool industry in Cincinnati, attended the dinner. Wallets with the name of each guest in gold letters served as place cards. Each guest also was given a recent photograph of Mr. Geier inclosed in a brochure entitled "Forty-Five Years," which contained a complete history of the Cincinnati Milling Machine Co., from 1884 to the present time. Speakers at the dinner included Henry Prentiss, New York, who was introduced as the "dean of the dealers", and Sol Einstein, chief engineer of the company. During the dinner George Merryweather, president of Motch & Merryweather, Cleveland, which has represented the company for 25 years, was presented with a bouquet of flowers to celebrate the company's twenty-fifth anniversary. Philip O. Geier, president of Cincinnati Grinders, Inc., was toastmaster.

—

H. M. LANE, president, H. M. Lane Co., industrial engineer, Detroit, has recently removed his office to Gray Gables, East River Drive, Grosse Ile, Mich.

—

MAURICE G. STEELE, director and development engineer of the Hart & Hutchinson Co., New Britain, Conn., has resigned to become manager of the Rome-Turney Radiator Co., Rome, N. Y. He has been active for years in the American Society of Mechanical Engineers, New Britain section, of late serving as vice-chairman of that body.

—

MAURICE E. BROWN, formerly foreman of the Union Malleable Iron Co., East Moline, Ill., has resigned to join the sales department of the Arcade Mfg. Co., Freeport, Ill., maker of hardware specialties and molding machines.

—

GUS A. SMITH, who started in 1906 in the foundry of the Simmons Co., Kenosha, Wis., has recently been named general manager of the Wisconsin plant, succeeding D. C. TRAVIS. From foundry foreman Mr. Smith was advanced to various posts and in 1922 became assistant general manager.

—

SAMUEL M. VAUCLAIN, chairman of the board of the Baldwin Locomotive Works, Philadelphia, addressed the Cleveland Engineering Society, at a dinner meeting Oct. 1, on "Business Requirements of Engineers in Industry." This was the first meeting on the society's program for the year.

—

RICHARD E. BROCK has been appointed chief engineer and master mechanic at the Etna. Pa., plant of Spang, Chalfant & Co., Inc., Pittsburgh, succeeding R. G. CONNELL, who resigned recently.

—

G. H. HEDRICK, vice-president, Thomas Spacing Machine Co., Glenshaw, Pa., has resigned.

—

H. E. PARKER, superintendent machinery division, Peck, Stow & Wilcox Co., Southington; F. G. HOUSMAN, factory superintendent, P. & F. Corbin Mfg. Co., New Britain; H. S. WASHBURN, Plainville Casting Co., Plainville; EDGAR SPENCER, Philbrick, Booth & Spencer, Hartford; P. W. SPENCER, Bradley & Hubbard Mfg. Co., Meriden; and CHARLES S. PARKER, Charles Parker Co., Meriden, have been appointed members of the advisory committee on foundry training in northern Connecticut to cooperate with the State Board of Education in bringing about closer relationships between the State trade schools and industries in that section.

—

D. M. AVEY, editor of *Foundry*, will address the Oct. 3 meeting of the Chicago Foundrymen's Club at the City Club, Chicago, on "Value of District Foundry Associations and General Foundry Progress."

—

RUDOLPH NELSON has been added to the Chicago branch staff of the United States Electrical Tool Co., Cincinnati.

FREDERICK E. GROSS, who has represented the pig iron department of the Donner Steel Co., Inc., Buffalo, in central and eastern New York, has resigned.

—

R. G. GUTHRIE, metallurgist, Peoples Gas Light & Coke Co., Chicago, is to speak on "Metallurgy for the Shop Man" at a dinner meeting of the Tri-City chapter of the American Society for Steel Treating at the Davenport Chamber of Commerce, Davenport, Iowa, Oct. 8. He was nominated president of the national

R. G. GUTHRIE

society at the annual convention, Sept. 9 to 13, and will take office Jan. 1.

—

PAUL J. KRUESI, president, Southern Ferro Alloys Corporation, Chattanooga, Tenn., has been elected president of the East Tennessee Coal & Iron Co., Knoxville, Tenn., succeeding the late SEN. LAWRENCE D. TYSON. Mr. Kruesi has been vice-president of the company for a number of years.

—

SCOTT TURNER, director of the United States Bureau of Mines, will sail from San Francisco, Oct. 10, to attend the World Engineering Congress at Tokio. He was appointed by President Hoover as one of the five Federal engineers who are to represent the United States Government at this congress. Mr. Turner also holds a commission to represent the American Committee of the World Power Conference, and is listed as a member of the official party representing the American Institute of Mining and Metallurgical Engineers. He plans to return to the United States the latter part of November.

—

J. HARVEY BRYAN, who represents the Apollo Steel Co., Apollo, Pa., and the Gulf States Steel Co., Birmingham, Ala., in New York, has been appointed New York district sales representative for Bliss & Laughlin, Inc., Harvey, Ill., maker of cold-drawn steel.

C. F. SCHERER, superintendent, Davenport Machine & Foundry Co., Davenport, Iowa, was elected chairman of the Tri-City Technical Council at a meeting held at the LeClaire Hotel, Sept. 20. HOWARD ROGERS, assistant treasurer, Williams, White & Co., Moline, Ill., was elected vice-chairman. E. C. XANDER, assistant secretary, Tri-City Manufacturers' Association, Moline, is the new secretary, and MAX SKLOVSKY, Deere & Co., Moline, continues as treasurer.

—

GEORGE D. KINGSLAND, who has been associated for many years with the Minneapolis-Honeywell Regulator Co., Minneapolis, has been placed in charge of the unit heater control division of the company.

—

EDWARD R. YOUNG, formerly research engineer of the Detroit Steel Casting Co., has joined the staff of the Climax Molybdenum Co., New York, as metallurgical engineer. He was graduated from the University of Michigan in 1915 and later specialized in foundry research as holder of an industrial fellowship in metallurgy.

—

JOSEPH JACOBSON has been added to the staff of the Goodell-Pratt Co., Greenfield, Mass., to handle sales in Michigan, with headquarters at 205 South Marlborough Street, Detroit. JOHN H. METZ, Richmond Hill, L. I., has taken over the territory formerly assigned to E. C. MESLOH, and the F. J. Keller Co., Capps Building, Dallas, Tex., has been appointed to take care of sales in Texas, Oklahoma, Louisiana and Arkansas.

—

RALPH MODJESKI, of Chicago, has been awarded the John Fritz medal "for notable achievement as an engineer of great bridges."

—

C. K. EVERITT, managing director and general manager of Edgar Allen, Ltd., Sheffield, England, was given a testimonial luncheon by FRITZ J. FRANK, president, The Iron Age Publishing Co., and C. S. BAUR, advertising manager, THE IRON AGE, on Sept. 26 at the Union League Club, New York. Others who were present were H. S. HOYT, president; J. KING HOYT, JR., secretary and treasurer; V. A. GREENE, vice-president and general manager, and W. A. METZE, assistant treasurer, respectively, of the Edgar Allen Steel Co., Inc., New York; F. W. ECKER, assistant treasurer, Metropolitan Life Insurance Co., New York; and GIFFORD LE-CLEAR, member of the firm of Densmore, LeClear & Robbins, architects and engineers, Boston. Mr. EVERITT sailed for England on the Franconia, Sept. 28.

—

G. H. CHARLS, president, National Association of Flat Rolled Steel Manufacturers, Cleveland, spoke on "Building the Family Spirit in Industry" at the opening of a three-day convention and exhibit, Sept. 30, of the National Industrial Advertisers' Association.

OBITUARY

H. COLE ESTEP, vice-president of the Penton Publishing Co., Cleveland, and prominent in the affairs of the American Foundrymen's Association, of which he had been a director the past year, died suddenly of heart disease Sept. 30, aged 43 years. He had been chairman of the committee

H. COLE ESTEP

on international relations of the American Foundrymen's Association for several years and it was largely through his efforts that the plan was adopted of having exchange papers between that association and European foundry societies. Mr. Estep was born in Stampede Tunnel, Wash., and was graduated as a mechanical engineer from the University of Minnesota in 1908. That year he joined the editorial staff of the *Iron Trade Review*, which he represented in Seattle and later in Chicago. In 1914 he became engineering editor of that publication, which position he held for three years. He was editorial director of the various Penton publications in 1918 and 1919 and European manager of these publications from 1919 to 1924. Mr. Estep was secretary of the Foundry Equipment Manufacturers' Association, member of the American Iron and Steel Institute, American Society of Mechanical Engineers, Institute of British Foundrymen, Engineers' Club of London, (British) Iron and Steel Institute, and Association Technique de Fonderie de France.

—

GEORGE W. GILBERT, vice-president, A. Gilbert & Sons Brass Foundry Co., St. Louis, died there recently, aged 58 years. He was born in St. Louis, and soon after his graduation from high school entered the employ of his father, A. Gilbert, who founded the institution which bears his name.

—

MORRIS BLOCK, president, M. N. Block Co., manufacturer of sheet metal products, Chicago, died recently of a fractured skull, following a fall in the bathroom of his home.

—

LOUIS VAUGHAN HUBBARD, president, Taft-Peirce Co., manufacturer of tools, dies and engineering instruments, Woonsocket, R. I., died of acute indigestion at his home in Montclair, N. J., Sept. 26, aged 63 years.

—

WALTER CHARLES WHITE, aged 52 years, president of the White Motor Co., Cleveland, died Sept. 29 from effects of injuries received in an automobile accident. He was graduated from Cornell University in 1898 and had been identified with the automotive industry since its early days. He was president of the White Co., the sales organization of the White Motor Co., a director of Bishop & Babcock Mfg. Co., Cleveland, and other companies.

Expect Gain in Shipments Over 1928 Last Quarter

WASHINGTON, Oct. 1. — Carload shipments of iron and steel during the fourth quarter of the year are expected by the Shippers' Regional Advisory Boards to total 522,943, or an increase of 5.4 per cent over the 496,038 carload shipments last year.

Machinery and boiler carload shipments are fixed at 54,391, an increase of 5.6 per cent over the 51,485 cars shipped during the last quarter of 1928. Coal and coke carload shipments are estimated at 3,079,509, an increase of 6.1 per cent over the 2,902,992 cars shipped for the corresponding period of last year. Ore and concentrate shipments estimated to require 472,053 cars, an increase of 3.1 per cent over the 457,907 cars for the final quarter of last year.

For the entire 29 commodities considered in the survey made by the Regional Advisory Boards, it is estimated that fourth quarter requirements will be about 9,134,023 cars, an increase of 2.3 per cent or 209,391 cars above the corresponding period of 1928, according to the Car Service Division of the American Railway Association.

Laconia Car Co. Drops Car Building Work

Laconia Car Co., Laconia, N. H., has definitely decided to discontinue the manufacture of street and railroad coaches. Several months ago, the management, following the failure of the company to secure certain Boston & Maine Railroad work, announced it was to discontinue operations, but such action was deferred. The Laconia plant has not been an important factor in the car building industry for three years. It will now devote its activities to power boat production.

Wholesale Prices Decline In August

Prices of commodities reported upon by the United States Bureau of Labor Statistics showed a fractional decline in August from the level of July, being 97.7 against 98, both referred to the average of 1926 is 100. Comparison shows 98.9 for August, 1928. Practically all of the 10 major items showed fractional changes.

Metals and metal products went down to 104.3, compared with 105 in July, owing partly to a decline in the iron and steel component from 97.9 to 97.6 and partly to a decline in automobile figures from 112.2 to 110.7. Non-ferrous metals, agricultural implements and other metal products did not change. Structural steel, one of the elements in the building material group, remained stationary at 99.6.

8-Month Automobile Output Near 12-Month Record

WASHINGTON, Sept. 21.—Making a decline of only 764, the August production of motor vehicles in the United States was 499,629 units, against 500,393 in July, according to the Department of Commerce. The output of passenger cars, however, increased by 17,553 units, rising to 443,714 from 426,159. Production of trucks decreased by 18,262 to 54,918 from 73,180, while there was a drop of 57 units in the production of taxicabs, the August total being 997 as against 1054 in July.

Canadian production of motor vehicles in August was 14,214, a drop of 3247 from the 17,461 produced in July and little more than one-third as much as in April last. The output of passenger cars was 11,037, a drop of 2563 from the 13,600 produced in July, while the truck production was 3177, a decline of 684 from the 3861 produced in July.

Production Increased

For the first eight months motor vehicles to the number of 4,223,414 were produced in the United States, an increase of 1,168,509 over the production of 3,054,905 for the corresponding period of last year. Passenger car production for the 1929 eight-month period increased to 3,642,211, a gain of 940,888 over the 2,701,323 produced during the corresponding period of 1928. Truck production increased by 218,979 units, rising to 568,519 from 349,540, and exceeding the 530,910 made in all of 1928, which itself was a record. Taxicab output was 12,684 for the first eight months, against 4042 during the corresponding period of last year, an increase of 8642.

Only three complete years have shown total output exceeding that for eight months this year: 1928, with 4,358,759 units; 1926, with 4,300,934; and 1925, with 4,265,830. At the August rate, 10 days of September's production would put the total ahead of any previous full year.

Canadian production of motor vehicles for the first eight months of 1929 was 220,036, compared with 181,459 during the corresponding period of last year, an increase of 38,577. Passenger car production was 176,250 against 152,265, an increase of 23,985. Truck output was 43,786 compared with 29,194, a gain of 14,592; it almost reached the 45,641 total for all of 1928.

Many More Portable Tools Exported

WASHINGTON, Sept. 28. — Foreign demand for American portable tools has been steadily expanding during the past few years and in 1928 sales exceeded $1,700,000, according to L. J. Cochrane, Industrial Machinery Division, Department of Commerce. Exports of last year, 33 per cent greater than those of 1926 and 47 per cent more than those of 1925, reflected a substantial gain over those of 1927.

During the first seven months of 1929 exports of portable tools were valued at $1,240,000, against about $920,000 for the like period of last year.

Shipments in 1928 went to more than 60 countries, the United Kingdom being the heaviest buyer, taking $465,000 worth, or 27 per cent of the total, but it was indicated that a considerable quantity was reexported. Japan was the next largest buyer, taking 15 per cent of all. Canada also was a large buyer, as was France, which took American portable tools to the value of $167,000.

Production and Shipment of Raw Materials and Finished Products

	August, 1929	July, 1929	August, 1928
By-product coke, net tons(a)	4,642,785	4,613,723	3,994,924

(a) United States Bureau of Mines.
(b) New high record for first eight months of any year.
(c) Number shipped; figures from Department of Commerce.
(d) Department of Commerce.
(e) Second highest total for any month.

Tin Exports from Malaya Are Increasing

WASHINGTON, Sept. 21.—Exports of tin from Malaya for the first six months of 1929 was 50,095 tons, while in the full year 1928 the total was 99,052 tons, valued at $109,028,000, or about 57 per cent of the world production, according to a report received from John H. Bruins, American consul at Singapore. Of the 1928 exports from Malaya, shipments to the value of $62,659,416 went to the United States. Total exports in 1927 were 83,773 tons and in 1926 they were 76,334 tons.

Philippine Steel Imports Up One-Half in 2 Years

WASHINGTON, Sept. 21.—Of 129,491 metric tons of iron and steel imported into the Philippine Islands in 1928, the United States provided 84,939 tons or 65.6 per cent, and Belgium 25,146 tons, according to a statement prepared by J. Joseph W. Palmer, Iron and Steel Division, Department of Commerce. In 1927 imports were 105,009 tons, of which 63,064 tons or 60 per cent came from the United States, 18,131 tons from Belgium and 13,539 tons from Germany. The 1926 imports totaled 86,727 tons, of which 55,742 tons or 64.3 per cent came from the United States, 13,198 tons from Germany, 10,874 tons from Belgium and 3850 tons from the United Kingdom. Largest items in 1928 were corrugated roofing sheets, 24,382 tons; railroad track material, 21,019 tons, steel bars or rods, 16,577 tons; and pipes and fittings. Of the corrugated roofing sheets imported, 24,056 tons came from the United States. America furnished 9882 tons of railroad track material; Belguim, 7719 tons; and Germany, 2348 tons. The United States supplied 12,638 tons of the imports of pipe and fittings.

Open-Hearth Capacity of Polish Mill Doubled

HAMBURG, GERMANY, Sept. 16.—The Friedenshütte A. G., Friedenshütte, Upper Silesia, Poland, the only important Polish steel plant in which American capital is not invested, has reorganized and expanded its capacity. The company has added six open-hearth furnaces, which will raise its output from 150,000 tons a year to more than 300,000 tons. Five of the furnaces are now in operation and the sixth, a 60-ton furnace, will be lighted in October.

A pamphlet entitled "Practical Aspects of Resuscitation" has been written by Edward Steidle, Dean of the School of Mines and Metallurgy, Pennsylvania State College, and published by Mine Safety Appliances Co., Pittsburgh.

Expansion in European Steel Mills

Several New Units in Operation—Pig Iron Prices Strong in Britain —Manganese Ore Plentiful—Italians Form Steel Cartel

(*By Cable*)

LONDON, ENGLAND, Sept. 30.

COKE prices are still advancing and sellers of Durham furnace coke are now asking 23s. 6d. ($5.70) per ton. Consequently pig iron prices are firm and Cleveland makers' quotations are unchanged. Midland furnaces, however, have advanced quotation 2s. 6d. (60c.) a ton on all grades.

Domestic demand is strong and good sales have been effected, but export is quiet, although inquiry is improving. Hematite iron is rather more active, but makers are not keen sellers at present prices, and some furnaces are piling their output in preference to selling.

Finished steel is generally quiet. The steel makers' association has reaffirmed prices, but advances are still being considered on the basis of increasing costs. Certain plate mills are well occupied while others, lacking orders for shipbuilding material, are seeking tonnage. Clyde launchings in September were 10 vessels of 28,000 tons, gross register.

Sales of Continental material here are dull despite declining prices. The International Steel Cartel has been prolonged until March 31, 1930, on the present basis. The International Rail Makers Association has reaffirmed prices.

Tin plate prices are strong as a result of sustained demand from consumers the world over buying for first quarter shipment at 19s. ($4.60) per base box, f.o.b. works port for large lots and 19s. 3d. ($4.66) per base box for small lots.

Galvanized sheet demand is slightly better, but mills are still in need of orders. Black sheets continue quiet.

The Ebbw Vale Steel, Iron & Coal Co. has issued notice of suspension to all iron and steel workers, about 4000 in all being affected. The chairman of the board states that foreign competition is the reason for closing the plant.

Luxemburg production in August was 252,000 metric tons of pig iron and 238,000 tons of raw steel. There were 38 furnaces in blast at the end of August.

Polish output in August was 65,000 metric tons of pig iron, 111,000 tons of raw steel and 80,000 tons of rolled steel.

The Saar output in August was 182,000 tons of pig iron and 192,000 tons of raw steel.

Russian output in August was 347,000 metric tons of pig iron, 400,000 tons of raw steel and 310,000 tons of rolled steel.

The Friedrich Krupp A. G., Essen, Germany, has laid off 1000, and the Rheinmetall A. G., 800 men.

British Pig Iron Prices Are Strong

Furnaces Still Claim Costs Leave Little Profit—Steel Market Quiet Except in Tin Plate

LONDON, ENGLAND, Sept. 17.—Business has not revived to any extent since the holiday period, but indications are that improvement will not be long delayed. Demand for pig iron has been consistently good during the past few months, and it appears that a considerable period of activity will ensue. With Continental iron no longer competitive in the British market, Cleveland furnaces are well engaged with domestic orders and have disposed of most of their October production. Scarcity and high cost of fuel still prevent a subtantial increase in output, but the number of furnaces in blast has increased steadily since May to the present total of 170, the largest since July, 1927.

Although Cleveland No. 3 foundry iron is at £3 12s. 6d. ($17.58) per ton, producers still complain that the margin of profit is too small. Hematite makers also seek higher prices, but each increase jeopardizes foreign business, which is most important to the hematite industry. Costs are in-

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp with the £ at $4.85

British Prices, f.o.b. United Kingdom Ports

Cleveland No. 3 foundry	£3	12½s.	to	£3	13½s.	$17.58	to	$17.82

*Open-hearth steel, 10s. ($2.42) per ton extra.

creasing, and it has been suggested that certain furnaces may be forced to suspend.

Finished iron and steel is still under the influence of the holidays. Inquiry is increasing, but the volume of new business is small, especially in heavy plates, as new tonnages from shipyards are slow to mature. Most of the shipyards are moderately well engaged, but there is little new tonnage to replace the old contracts being completed. The sheet market is quiet, but tin plate is active, with fall demand developing. Prices are strong, with a rising tendency, and mills are well sold ahead on the basis of restricted output. Overseas users are beginning to inquire for their 1930 requirements.

The recent report of the merger of Bolckow-Vaughn & Co. with Dorman, Long & Co., with a combined capital of about £20,000,000 ($97,000,000) has not been confirmed by any official statement from either company.

Italian Steel Cartel Is Formed

Includes 95 Per Cent of Producers — Not Expected to Affect Decision to Remain Out of International Cartel

ROME, ITALY, Sept. 13.—An Italian steel syndicate, which embraces about 95 per cent of the country's capacity, has been formed at the suggestion of the Government. A partial syndicate was established about one year ago, being organized as a stock corporation under the name of the Conzorzio Italiano delle Acciaierie e Ferriere. This syndicate included 16 corporations, which account for about two-thirds of the total national production. However, an important group, the Acciaierie e Ferriere Lombarde of Milan, refused to become a member and competition remained severe in the domestic market. This latter corporation has joined the new syndicate, and a more orderly market and rationalization of production are expected.

The steel industry of the country has 120 open-hearth furnaces and 60 electric furnaces with a total rated capacity of about 3,000,000 tons a year. Annual output, however, has never reached 2,000,000 tons. Production is spread over 40 steel works, and some of the minor companies produce less than 20,000 tons a year. Prices are high, partly because of uneconomic methods in some plants and partly on account of the general competition for supplies of raw material. With the new syndicate functioning, it is planned to buy all raw materials for members through a joint purchasing organization.

Each member company of the syndicate will be alloted a quota on the basis of its output of products and its rated capacity. It is believed that domestic prices will be advanced, and in some quarters increases of as much as 100 lire per ton are considered necessary. Italy's steel production was only 933,000 metric tons in 1913, but reached a high of 1,785,500 tons in 1925, after which it declined to 1,779,500 tons in 1926 and 1,594,500 tons in 1927. The total in 1928 was 1,692,632 tons.

Establishment of the syndicate is not expected to affect Italy's decision to remain outside the International Steel Cartel, since Italian production is claimed to be almost exclusively for domestic use. The pre-war syndicate of steel producers in Italy had certain relations with the pre-war German Stahlwerksverband, governing importation by Italy of German semi-finished material, structural shapes and rails, but the agreement was not renewed after the war.

Cartel Is Provisionally Renewed

(*By Radio*)

BERLIN, GERMANY, Sept. 30.

THE International Steel Cartel has been renewed provisonally until the end of March. No decisions were reached at the cartel meeting on the questions in dispute among the member countries, but prospect of a definite renewal is considered better. Production quotas of the cartel for the fourth quarter are unchanged.

Domestic prices of the German Steel Syndicate are unchanged for October. The home market is quiet, but production of iron and steel continues at the highest level since the war. Export trade is dull, except in semi-finished material, which is moving in good volume and firm prices to consumers in Great Britain. Export of pig iron to Belgium is also heavy.

Foreign demand for machinery and machine tools is active and machinery exports in August established a new high record.

Large Stocks of Manganese Ore in Caucasus

HAMBURG, GERMANY, Sept. 16.—The large manganese ore contract that the Russian Government recently closed with the United States Steel Corporation has directed the attention of Continental ore consumers to the greatly increased output of the Georgian mines since the Russian Government began operation, after terminating the contract with the Harriman interests in the United States. Operations have been greatly increased and stocks of manganese ore at Black Sea ports and at the mines are of record tonnage. As a result, German merchants dealing in manganese ore hesitate to buy in advance, apprehending that the Russian Government may find stocks so large as to necessitate "dumping," which would seriously affect the world market.

Stocks of manganese ore in Georgia in June are estimated to have been 500,000 metric tons. In arriving at an estimate it is pointed out that production in the fiscal year 1927-1928, was 304,000 tons, but from Oct. 1, 1928 to June 30, 1929, was 747,500 tons. Exports, however, increased from 203,000 tons in 1927-1928 to a total of 428,000 tons in the period from Oct. 1, 1928 to June 30, 1929. Consumption in Russia advanced from 73,000 tons in 1927-1928 to about 90,000 tons in the October-June period. Stocks at the mines and at ports in Georgia on Oct. 1, 1928, totaled about 200,000 tons.

Second New Krupp Stack Blown In

HAMBURG, GERMANY, Sept. 16.—The Friedrich Krupp A. G. has blown in the second of its new furnaces at Borbeck.

The company has practically completed construction of the largest cement plant in Russia at Gaiduk, Noworossisk, and has installed the machinery.

Recently the Siemens Halske A. G. received the contract to construct an entire automatic telephone system at Hankow, China, with exchanges in other Yangtse Valley cities.

German Exporters Expect More American Business

HAMBURG, GERMANY, Sept. 16.—Exporters of steel believe that the recent sharp reduction in the export prices of semi-finished material will bring increased orders from the United States. American consumers were substantial buyers of German semi-finished steel until the price advances in 1928, when this trade practically ceased.

Recently inquiries from the United States have been more numerous and some small lots have been booked by German mills. Exporters suggest that there is again a possibility of selling small tonnages of sheet bars, billets and skelp to American consumers near Gulf ports.

Output Per Furnace Up

HAMBURG, GERMANY, Sept. 16.—In the past few years German output per blast furnace has been raised materially through construction of larger stacks and abandonment of the older small-capacity furnaces. With 94 furnaces in blast at the end of August, 1925, production totaled 707,311 metric tons, while in August of this year with 95 furnaces in blast, production was 1,167,807 tons. It is expected that 20 or more old furnaces will be dismantled within the next year.

Machinery Markets and News of the Works

Tool Sales Slow Down

Cleveland Exposition This Week Expected, However, to Stimulate Business

SEPTEMBER machine tool sales failed to keep pace with those of August, and in some markets the decline was pronounced. However, the National Machine Tool Exposition in Cleveland this week is expected to stimulate buying, and builders agree that the outlook for fall business is favorable.

The respite in the steady flow of orders has been welcomed by machine tool plants, which have been compelled to push delivery dates farther ahead on account of the heavy accumulation of bookings. Despite the slowing down in activities, most shops have sufficient business on their books to maintain operations at full capacity until January or February.

The Continental Motors Co., Muskegon, Mich., has made purchases against its list. The Simmons Co., Kenosha, Wis., has placed orders for new press equipment at a cost of $250,000.

A northern Ohio manufacturer in the automotive field is inquiring for 20 to 30 tools. At Chicago dealers are quoting on a list of 17 machine tools for export to the Orient.

New York

NEW YORK, Oct. 1.—In the week preceding the opening of the National Machine Tool Exposition in Cleveland, sales of machine tools in the New York district turned sharply downward. There was a good volume of inquiry, however, and prospects continue good for the fourth quarter of the year. Considerable prospective business has admittedly been held up because buyers desired to inspect the machines to be shown at Cleveland before placing orders. One pending order for about $80,000 worth of tools probably will be placed shortly after the end of the Cleveland show. Requirements of the Amtorg Trading Corporation for a new tractor works in Soviet Russia are a feature of current demand.

Contract has been let by Cutler-Hammer Mfg. Co., 8 West Fortieth Street, New York, manufacturer of electrical control equipment and devices, to Barney-Ahlers Construction Corporation, 110 West Fortieth Street, for six-story addition to plant at Southern Boulevard and 144th Street, 90 x 150 ft., to cost about $300,000 with equipment. Headquarters and main plant are at Milwaukee.

Edward Victor, New York, has leased building at 38-44 West 144th Street, for machine and automobile repair shop.

Apollo Magneto Corporation, Kingston, N. Y., manufacturer of magnetos and kindred products, has acquired plant and business of Automatic Motor Control Corporation, 4-06 Astoria Avenue, Long Island City, and will consolidate. Equipment will be removed to Kingston where production will be concentrated and works will be extended to accommodate increase.

New York Belting & Packing Co., 91 Chambers Street, New York, manufacturer of mechanical belting, etc., will erect four-story and basement addition to plant at Passaic, N. J., to cost over $250,000 with equipment. Lockwood Greene Engineers, Inc., 100 East Forty-second Street, New York, is architect and engineer.

Safe-Guard Check Writer Corporation, 5 Beekman Street, New York, manufacturer of check protecting devices and equipment, has purchased property and business of Hercules Check Certifier Co., New York, and will consolidate. Expansion is planned.

William A. Lacerenza, 26 Court Street, Brooklyn, architect, has plans for a one-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Rainbow Luminous Products Co., affiliated with Rainbow Light, Inc., 21-43 Forty-fourth Road, Long Island City, manufacturer of electric tube lighting equipment, is planning expansion to develop new specialties, including aviation beacons, white light tubes for interior lighting, etc. Company has secured financing for work. Raymond R. Machlett is president.

United Electric Coal Companies, Inc., 52 Vanderbilt Avenue, New York, is arranging for purchase of Electric Shovels Coal Corporation and affiliated interests, operating coal properties in Indiana, including surface mining by electric shovels. An expansion program is proposed.

City Council, Mount Vernon, N. Y., will soon begin superstructure for a one-story municipal service, repair and garage building for city-owned motor trucks and cars, to cost $100,000 with equipment.

American Bread Wrapper Co., 361 East Ohio Street, Chicago, manufacturer of processed paper wrappers, has leased space in new Bronx terminal of Lehigh Valley Railroad, New York, for factory branch and distributing plant.

Industrial Welded Alloys, Inc., a subsidiary of Industrial Alloy Products Corporation, Newark, Wallace C. Johnson, president, has taken over former local plant of Titan Steel Co., Lister Avenue, for new plant. Property consists of factory units totaling 75,000 sq. ft. floor space. A fabricating and machine shop will be operated for manufacture of stainless steel pressure vessels, pipe condensers, digesters, etc., with foundry for production of stainless steel and other alloy castings.

Harnischfeger Corporation, Milwaukee, and Eastern organization known as Harnischfeger Sales Corporation, 50 Church Street, New York, have leased one-story building totaling 12,000 sq. ft. floor space, to be erected at Hoboken, N. J. It will be equipped as main Eastern factory branch for assembling, repairing and distributing cranes, steam shovels and other hoisting machinery manufactured at Milwaukee plant, to cost more than $40,000.

Board of Education, Essex County Vocational Schools, Hall of Records, Newark, has rejected bids recently received for new three-story boys' vocational school at Bloomfield, N. J., to cost about $500,000 with equipment, and will take new bids soon on revised plans. Guilbert & Betelle, 24 Branford Place, are architects.

Newark Rivet Works, Inc., 262 Lafayette Street, Newark, has awarded general contract to William L. Blanchard, 972 Broad Street, for four-story addition, 100 x 100 ft., to cost over $80,000 with equipment. Victor H. Strombach, 1285 Stuyvesant Avenue, Union, N. J., is architect.

Sylentlyte Corporation, New York, has been formed with capital of 600 shares of no par value common stock to import automobile bodies made by Hibbard & Darrin, Paris, France. Bodies are made entirely of Bohn aluminum. Later they may be manufactured in United States. Offices of company will be at 20 East Fifty-seventh Street, New York, but temporarily all communications should be addressed to William May Wright of Wright, Slade & Co., 71 Broadway, New York.

New England

BOSTON, Sept. 30.—With interest of both buyer and seller focussed on the machine-tool show at Cleveland this week, the New England market is practically at a standstill. No new tools of importance have been sold, and sales of used tools were scattered.

Small tools continue active and deliveries are growing more extended.

W. L. Blake Co., 79 Commercial Street, Portland, Me., mill supplies, has started work on a one-story pipe shop, 80 x 100

ft. Cutting and miscellaneous equipment will be needed.

Samuel Galkin Co., 60 South Water Street, Providence, operating an automobile sheet metal works, is about to start work on a one-story and basement repair shop addition, 46 x 100 ft. Punches and shearing tools may be purchased.

Salem Electric Co., Salem, Mass., has plans for a power house on former Philadelphia & Reading Coal Co. wharf. Details are lacking, but handling equipment will be purchased.

Turners Falls Power & Electric Co., Turners Falls, Mass., has started work on a power station unit, 32 x 95 ft., to cost $50,000 without equipment.

Anglo-American Textile Machinery Co., Abington, Mass., has plans for a one-story addition, 30 x 100 ft., for one unit and a similar addition for another unit. Special machinery will be purchased.

Reed-Prentice Corporation, Cambridge Street, Worcester, Mass., manufacturer of machine tools, has awarded general contract to E. J. Cross Co., 82 Foster Street, for one-story addition, 65 x 150 ft., to cost about $50,000 with equipment.

Associated Gas & Electric Co., 61 Broadway, New York, has work under way on addition to artificial gas plant at Worcester, Mass., to have capacity of 7,000,000 cu. ft. carbureted gas per day, to cost over $500,000 with line extensions. Company is also carrying out expansion at Plattsburg, N. Y., where new artificial gas unit of 600,000 cu. ft. capacity will be installed and new distributing lines constructed.

Walworth Co., Statler Building, Boston, manufacturer of valves, steam specialties, etc., has purchased plant and business of Westcott Valve Co., East St. Louis, Ill., and will consolidate. Westcott plant will be continued for Middle West factory branch, and expansion carried out.

Hawie Mfg. Co., 729 North Washington Avenue, Bridgeport, Conn., manufacturer of wire goods, sheet metal buckles, etc., has filed plans for a one-story addition, 50 x 89 ft., to cost about $24,000 with equipment.

Board of Education, Woburn, Mass., will install manual training department in new one- and three-story high school to cost about $600,000, for which plans have been filed.

American Reinforced Paper Co., Starkey Avenue, Attleboro, Mass., has awarded general contract to C. K. Rathbone, Hospital Trust Building, Providence, for one-story addition, 45 x 175 ft., to cost about $45,000. Charles T. Main, Inc., 201 Devonshire Street, Boston, is architect.

Plainville Electro-Plating Co., Plainville, Conn., has begun construction of one-story plant, to cost about $20,000 with equipment.

Detroit Radio Products Corporation, 1040 West Fort Street, Detroit, has leased space in former plant of Everett Mills, Lawrence, Mass., for branch plant.

Buffalo

BUFFALO, Sept. 30.—Contract has been let by Rollway Bearing Co., 541 Seymour Street, Syracuse, N. Y., manufacturer of metal bearings to Hemmer Co., 315 Sunset Avenue, for one-story addition, to cost about $30,000 with equipment.

Officials of Columbus-McKinnon Chain Co., Tonawanda, N. Y., manufacturer of steel and iron chains, etc., have organized a company under same name, with capital of 30,000 shares of stock, no par value, to take over and expand local plant. New company is headed by Julius F. Stone, 1062 Westwood Avenue, Columbus, Ohio; Julius F. Stone, Jr., and Frank T. Stone, Tonawanda.

Union Free School District No. 6, Ellicott, N. Y., is said to be planning installation of manual training equipment in two-story high school at Falconer, N. Y., to cost about $240,000, for which bids have been asked on general contract. R. A. Freeburg, Hotel Jamestown Building, Jamestown, N. Y., is architect.

Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, has acquired Fleet Aircraft Corporation, Buffalo, and will consolidate. Fleet plant will be continued in service and capacity increased from two to three planes daily. Company has also purchased a substantial interest in Kinner Airplane & Motor Corporation, Glendale, Cal., and will be active in management of that organization, which will develop larger capacity. Lawrence D. Bell is vice-president.

Houde Engineering Corporation, 537 East Delavan Avenue, Buffalo, manufacturer of shock absorbers, a subsidiary of Houdaille-Hershey Corporation, same address, is arranging an expansion program to cost $200,000. Majority of fund will be used for purchase of new equipment. Parent organization is also making additions to plants of General Spring Bumper Corporation, Chicago and Decatur, Ill., another unit.

Philadelphia

PHILADELPHIA, Sept. 30.—Bids will be asked in about 30 days by F. G. Vogt & Sons, Inc., Thirtieth and Race Streets, Philadelphia, meat packer, for three- and four-story plant, to cost $1,000,000 with equipment; a refrigerating plant will be installed. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

Paper Manufacturers' Co., Fifth and Willow Streets, Philadelphia, manufacturer of paper products, has awarded general contract to Edwin E. Hollenback, Inc., 1910 North Marshall Street, for new plant unit, to cost $50,000 with equipment. Clarence E. Wunder, 1520 Locust Street, is architect.

Lamont Gear & Machine Co., Inc., 2631 West Oxford Street, Philadelphia, has leased a part of building at Rising Sun Avenue and Bristol Street for parts production and assembling.

Board of Education, Nineteenth and Ludlow Streets, Philadelphia, is considering installation of manual training equipment in new four-story and basement junior high school at Thirty-third and Tasker Streets, to cost $1,200,000, for which plans are being completed by Irwin T. Catharine, architect for board, address noted.

Sol J. Maschke, 6244 Chestnut Street, Philadelphia, and associates have organized Rusticraft Fence Co., with capital of $100,000, to operate a plant at Malvern, Pa., to manufacture iron and other metal fencing, garden and farm furniture, etc. Samuel H. Tendler, 5459 Euclid Avenue, Philadelphia, is interested in new organization.

Good Lines, Inc., Camden, N. J., care of O. H. Higginbotham, Camden, recently formed by Mr. Higginbotham and associates, has purchased five-acre tract at Hi-Nella, N. J., as site for new plant to manufacture airplanes. Departments for parts production and assembling will be installed. Plans will be drawn at once. Plant will cost more than $65,000 including equipment.

Board of Education, Bridgeton, N. J., plans installation of manual training equipment in new two-story junior high school to cost $400,000, for which bids have been asked on general contract. Edwards & Green, 548 Federal Street, Camden, N. J., are architects.

Modern Utilities Co., Paxton Street, Harrisburg, Pa., manufacturer of floor plates for fitting around radiator and steam pipes, scales for measuring pipe lines, levels, etc., is planning expansion, increasing capacity of present plant to concentrate production at that place, discontinuing out-of-town manufacture and assembling at Harrisburg. Work will cost more than $50,000 with equipment. Grover C. Frantz is head.

Standard Oil Co. of Pennsylvania, Inc., Sixth and Chestnut Streets, Philadelphia, is planning new oil storage and distributing plant at Lancaster, Pa., to cost about $140,000 with equipment.

Inland Utilities, Inc., Harrisburg, Pa., operating water and gas properties in Pennsylvania and West Virginia, is disposing of new bond issue of $3,250,000, part of proceeds to be used for extensions and improvements in plants and systems.

South Atlantic

BALTIMORE, Sept. 30.—Contract has been let by Flynn & Emrich Co., 301 North Holliday Street, Baltimore, manufacturer of mechanical stokers, parts, etc., to C. W. Schmidt, Hearst Tower Building, for one-story addition, to cost $75,000 with equipment. W. S. Austin, Maryland Trust Building, is architect and engineer.

Davison Chemical Co., Garrett Building, Baltimore, manufacturer of commercial fertilizers, acids, etc., has acquired 15 acre tract on Houston ship channel, Houston, Tex., as site for new plant, including machine shop, boiler house and other structures, to cost about $850,000 with machinery. Company operates a subsidiary under name of Davison-Pick Fertilizers, Inc., Whitney Building, New Orleans, with plants at New Orleans, and Orange, Tex.

Carolina-Virginia Power Co., Roanoke Rapids, N. C., has applied for permission to construct a hydroelectric generating plant on Roanoke River, about 20 miles from city, where site has been secured, to have initial capacity of 30,000 hp. Transmission lines will be built for connection with system of Virginia Electric & Power Co., Richmond, which will use large part of output. Project will cost over $700,000.

Tide Water Oil Sales Corporation, Court Square Building, Baltimore, a subsidiary of Tide Water Oil Corporation, 11 Broadway, New York, will take bids in about 30 days for second unit of storage and distributing plant at Wagners Point, to cost more than $150,000 with equipment.

Curtiss Airports Corporation, 27-29 West Fifty-seventh Street, New York, has awarded contract to Engstrom & Wynn, 1117 Chapline Avenue, Wheeling, W. Va., for two-story hangar, 100 x 120 ft., at Baltimore, to include reconditioning and repair department, to cost about $80,000 with equipment. Kenneth Franzheim, 345 Madison Avenue, New York, is architect.

Horace E. Dodge Boat & Plane Co., 3 East Fifty-second Street, New York, Horace E. Dodge, president, recently organized to manufacture motor boats, flying boats and amphibian planes, has engaged Philip L. Small & Associates, Terminal Tower Building, Cleveland, architects and engineers, to prepare plans and supervise construction of new plant

on 100 acre tract at Newport News, Va., recently acquired, to cost about $1,000,000 with equipment. Company will take over and succeed to Horace E. Dodge Boat Works, Inc., 614 Lycaste Avenue, Detroit, and will remove plant to new location, where increase in present output will be carried out. J. Gilmore Fletcher is vice-president, and William M. Horne, secretary and treasurer.

Georgia Power Co., Atlanta, Ga., has plans for construction of new hydroelectric generating station on Oconee River at Purman Shoals, about four miles from Milledgeville, Ga., with initial capacity of 60,000 hp., divided into two 30,000 hp. generating units. Project will include transmission system to connect with present lines of company, and will cost more than $1,000,000.

City Council, Griffin, Ga., E. P. Bridges, city manager, will receive bids until Oct. 10 for equipment for new water supply development, including electric-operated pumping machinery with accessories, 300,000 gal. capacity steel standpipe, etc. Robert & Co., Inc., Bona Allen Building, Atlanta, Ga., is engineer.

Chicago

CHICAGO, Sept. 30.—Of special interest in local machine-tool trade circles is a list of 17 machines for export to the Orient. Progress is said to have been halted on the Pullman company's list for its Buffalo plant. Additional purchases have been made against the requirements of Continental Motors Corporation, Muskegon, Mich. Preliminary steps are being taken by a farm implement manufacturer to enter the market in a large way later this year. Railroad inquiry is confined to a request from the Illinois Central which is asking for prices on a 5-ft. radial drill. Simmons Co., Kenosha, Wis., has recently placed orders for new press equipment that aggregate close to $250,000.

As a whole September has been a profitable month for most sellers. Orders for large and small tools have been scattered, but the aggregate was good volume. Sales quotas in most instances were passed soon after the middle of the month.

The list for export to the Orient follows:

One 20-in. drill
One 20-in. shaper
One No. 2 key slotter
One 6-in. x 6-in. hack saw
One 24-in. and one 12-in. lathes
One 6-in. pipe machine
One sensitive drill
One 8-ft. steel break
One slitting shear
Two ¾-in. punches, one 24-in. throat and one 30-in. throat
One plate bending roll
One 40-lb. hammer
One tool and drill grinder
One 62-in. boring mill
One universal miller

Ingalls-Shepard Division of Wyman Gordan Co., Harvey, Ill., has started erection of an addition to house a heat-treating department.

Injunction halting construction of North Shore Foundry, Greenfield Avenue, North Chicago, has been dissolved by court action.

Hafner Mfg. Co., Chicago, maker of mechanical toys, has purchased site, 100 x 300 ft., on Kolmar Avenue, for one-story factory. Austin Co. is drawing plans.

The Crane Market

NEW inquiry for overhead cranes is small, but some substantial orders are pending award. A recent inquiry includes four 10-ton electric cranes for a plant in Chattanooga, Tenn. Among locomotive crane inquiries is one from the Baltimore & Ohio Railroad for two 25-ton, Diesel-driven cranes. Fay, Spofford & Thorndyke, Boston, consulting engineers, have been accepting bids on two 10-ton and two 20-ton, electric overhead cranes for the cast iron pipe foundry to be erected at Chelsea, Mass., for the Intercontinental Pipe & Mining Co. The National Tube Co., Chicago, is inquiring for a sizable list of electric traveling cranes.

Among recent purchases are:

Amtorg Trading Corporation, New York, 20-ton, 48-ft. span, hand power crane from Box Crane & Hoist Corporation.

Delaware, Lackawanna & Western Railroad, New York, four 5-ton, 26-ft. span hand power cranes for sub-stations at Newark, Summit, Kingsland and Denville, N. J., from Box Crane & Hoist Corporation.

General Electric Co., Schnectady, N. Y., two 10-ton electric cranes from unnamed bidder.

W. W. Jourdin Co., New York, 10-ton, 48-ft. span hand power crane from Box Crane & Hoist Corporation.

Edison Electric Appliance Co., Chicago, 10-ton, 61-ft. span overhead electric crane from unnamed bidder.

International Harvester Co., West Pullman, Ill., 15-ton, 113-ft. span electric crane from Whiting Corporation.

Broderick Co., Muncie, Ind., 20-ton, 60-ft. span electric crane from unnamed bidder.

Onsoud Machine Works, Chicago, 10-ton, 38-ft. span overhead electric crane from Whiting Corporation.

Rundle Mfg. Co., Milwaukee, 5-ton, 80-ft. span and 3-ton, 23-ft. span overhead electric cranes from Milwaukee Electric Crane & Mfg. Corporation.

Faith Mfg. Co., 2531-33 North Ashland Avenue, Chicago, manufacturer of die castings, etc., has awarded contract to W. Maedge, 5033 North Kostner Avenue, for a two-story plant, 120 x 145 ft., to cost about $70,000 with equipment.

Standard Oil Co., Main Street, Decatur, Ill., has plans for one-story storage and distributing plant at Robinson, Ill., to cost about $50,000 with equipment.

City Council, Duluth, Minn., has plans for steam power plant for central heating service in downtown district, to cost about $850,000 with equipment. W. J. Sullivan, Palladio Building, is architect.

Chicago, Rock Island & Pacific Railroad Co., 179 West Jackson Boulevard, Chicago, has awarded general contract to A. H. Neumann & Co., Hubbell Building, Des Moines, Iowa, for addition to local engine house, with repair facilities, to cost $65,000. A. T. Hawks is chief engineer.

Flour City Ornamental Iron Works, Inc., 2637 Twenty-seventh Avenue, South, Minneapolis, will soon begin superstructure for two-story addition, 60 x 100 ft., for which general contract recently was let to Piper, Drake & Schumacher, Baker Building, to cost about $45,000 with equipment.

International Tool & Engineering Co., 1910 Kedzie Avenue, Chicago, has asked bids on general contract for one-story unit, to cost about $30,000 with equipment. C. E. Frazier, 64 West Randolph Street, is architect. O. B. Bensen is president.

Chicago, Milwaukee, St. Paul & Pacific Railroad Co., Third Avenue, South, and Washington Street, Minneapolis, Minn., has plans for addition to local engine house, with repair facilities, to cost more than $80,000 with equipment. Arthur Daniels is district engineer.

Gardner-Denver Co.'s plant addition at Quincy, Ill., will be ready for occupancy Dec. 1. Company manufactures slush pumps, air compressors, rock drills, drill sharpeners and high-pressure drill steel forges. It has other plants at Denver, and La Grange, Mo.

Pittsburgh

PITTSBURGH, Sept. 30.—Machine-tool business has been rather quiet the past week, but inquiries are coming out regularly and orders are expected to improve materially after the machine-tool show in Cleveland. The list of the Westinghouse Electric & Mfg. Co. will be issued this week and it is expected to fully equal the usual quarterly requirements of that company. Railroad buying still lags, but improvement is looked for as the carriers are announcing heavy fall inquiries for rails and cars, and plan to be busy in their own shops also.

Deliveries of machine tools and heavy machinery are considerably delayed by many companies and local dealers are unable to bid on inquiries on which they would ordinarily be interested. Plant extensions in the Youngstown district are expected to require heavy quotas of tools and equipment and some large projects in the Pittsburgh area are quickly reaching the buying stage.

Contract has been let by Titusville Iron Works, Inc., Titusville, Pa., to Austin Co., Cleveland, for one- and two-story addition, 50 x 150 ft., to cost more han $100,000 with equipment.

Pittsburgh Metal Airplane Co., Pittsburgh, organized a few months ago by officials of Pittsburgh Aviation Industries Corporation, and now occupying part of former plant of American Car Co., will increase facilities for manufacture of all-metal cabin aircraft. Company has recently acquired Thaden Metal Aircraft Co., San Francisco, which has been removed to Pittsburgh where production will be concentrated. H. V. Thaden is chief engineer.

West Penn Power Co., West Penn Building, Pittsburgh, is arranging for a preferred stock issue to total $9,000,000, part of fund to be used for extensions and improvements in power properties and systems in western Pennsylvania and West Virginia.

Iroquois Gas Co., Oil City, Pa., subsidiary of National Fuel Gas Co., is carrying out expansion, to include construction of about 75 miles of new high-pressure transmission pipe lines, and 65 miles of low-pressure lines. Company has also acquired oil and natural gas lands in Cataraugus, Wyoming and Allegheny counties for development.

Fairmont Mining Machinery Co., Tenth Street, Fairmont, W. Va., is planning one-story addition to structural shop for fabricated steel production, one-story addition to foundry, and enlargements in machine shop. A new overhead traveling crane system will be installed. En-

tire program will cost about $100,000 including equipment.

City Council, Huntington, W. Va., has plans for a new hangar of six-plane type at municipal airport, with repair and reconditioning facilities, to cost about $50,000 with equipment. Louis Stone is field manager.

Pennsylvania Pipe Thread Protector Co., Pittsburgh, recently formed by Maurice M. Cavitt, 806 Heberton Avenue, and associates, is considering operation of local plant to manufacture pipe thread protectors, pipe fittings and kindred specialties. Company is capitalized at $50,000. Martin J. Roeser, 4743 Baum Boulevard, is interested in new organization.

Direct Flush Tank Co., Huntington, W. Va., has been incorporated to hold patent rights on a flush tank designed by D. F. Tracey. Company is soliciting inquiries from manufacturers who can furnish sheet metal and cast iron enameled tanks, vitreous porcelain tanks, brass flush valves, brass syphons and other metal parts. Communications should be addressed to D. F. Tracey, Box 55, Huntington.

Cleveland

CLEVELAND, Sept. 30.—The falling off in machine-tool sales, previously noted, has become more general, the slackening in orders having extended to some manufacturers who had not been affected by the lull. September sales showed a sharp decline as compared with August. Deliveries of some lines are beginning to show some improvement Manufacturers are not much concerned over the slowing down as the majority have good backlogs of orders.

An inquiry for 20 to 30 machines from a northedn Ohio manufacturer in the automotive field came out the past week. The prospective buyer may purchase used machinery. A fair amount of business is in prospect in single tool orders, but most of this is being held until after the machine-tool show this week.

Wheeler Metal Products Corporation, 1637 Collamer Avenue, Cleveland, has awarded contract to Austin Co. for a one-story addition, 80 x 300 ft. Company will extend its products to include heavy steel stampings and will use new building for steel stamping plant and other manufacturing purposes.

Osborn Mfg. Co., Cleveland, will erect an addition, 49 x 106 ft.

John Harsch Bronze & Foundry Co., manufacturer of brass, bronze, aluminum and manganese castings, Cleveland, states that it does not intend to build a new plant in near future, as reported recently in these columns. Company says that it will not build for at least two years.

Plans are being completed by Toledo Pipe Threading Machine Co., 1445 Summit Avenue, Toledo, Ohio, manufacturer of machine tools, for a two-story addition, to cost about $50,000 with equipment. Mills, Rhines, Bellman & Nordhoff, Ohio Building, are architects and engineers.

Sterling Grinding Wheel Co., Tiffin, Ohio, manufacturer of grinding wheels and other abrasive materials, has asked bids on general contract for a one-story addition, to cost about $45,000 with equipment. George S. Rider Co., Century Building, Cleveland, is architect and engineer.

Youngstown Radio, Lamp & Novelty Co., Scienceville Road, Youngstown, manufacturer of radio equipment, metal products, etc., has plans for a one- and two-story plant, to cost about $30,000 with equipment. Zenk & Campbell, 120 Wood Street, are architects.

National Lime & Stone Co., Bluffton, Ohio, is planning to rebuild part of quarry and mill destroyed by fire Sept. 19.

Dauntless Coal Co., Saltillo, Ohio, is planning expansion, including installation of mining machinery and surface equipment.

Columbia Axle Co., 852-76 East Seventy-second Street, Cleveland, manufacturer of automobile axles, etc., is considering one-story addition, to cost about $40,000 with equipment.

P. E. Hart, Akron, Ohio, and associates have organized Snyder-Hart Co. to manufacture radio equipment and parts. Former local mill of American Tire & Rubber Co. will be remodeled for initial plant. Floyd C. Snyder, Massillon, Ohio, is president.

Department of Parks and Public Property, City Hall, Cleveland, R. L. Harding, director, has plans for one-story municipal automobile service, repair and garage building, to cost about $100,000 with equipment. H. Kregelius, City Hall, is city architect.

St. Louis

ST. LOUIS, Sept. 29.—Woods Brothers, inc., 407 Security Building, Kansas City, Mo., manufacturer of airplanes and parts, is considering plans for new one-story plant at St. Joseph, Mo., for parts production and assembling, to cost about $55,000 with equipment. G. E. Stanley is one of heads of company in charge.

Central Brass & Aluminum Foundry Co., 503 South Twenty-first Street, St. Louis, has filed plans for a one-story addition, 33 x 60 ft., to cost about $20,000 with equipment.

National Garage Co., 1220 West Sixty-second Street, Kansas City, Mo., Harry A. Rubin, president, has plans for a six-story and double basement service, repair and garage building, 115 x 155 ft., with foundations to carry six additional stories, to cost more than $500,000 with equipment. Charles A. Smith, Finance Building, is architect.

Common Council, Galt, Mo., has approved plans for a municipal electric light and power plant, to cost about $35,000 with equipment. Rollins Engineering Co., Railway Exchange Building, Kansas City, Mo., is engineer.

Pittsburgh Equitable Meter Co., 400 Lexington Avenue, Pittsburgh, manufacturer of gas meters, parts, etc., has plans for one-story factory branch and distributing plant at Tulsa, Okla., 50 x 150 ft. to cost about $65,000 with equipment. Rush, Endacott & Goff, New Wright Building, Tulsa, are architects. A. J. Kerr, Kennedy Building, is local manager.

Ryan Aircraft Corporation, Lambert-St. Louis Flying Field, St. Louis, manufacturer of airplanes and parts, has plans for new one-story unit for parts production and assembling, to cost about $90,000 with equipment, near present plant or at Parks Airport, East St. Louis, Ill. Company is subsidiary of Aircraft Development Corporation, Union Trust Building, Detroit.

Curtiss Flying Service, Inc., Britton, Okla., B. S. Graham, local manager, with headquarters at 27-29 West Fifty-seventh Street, New York, has plans for new hangar, 100 x 120 ft., at local airport, with two-story reconditioning and repair shop adjoining, to cost $75,000 with equipment. M. L. Russell Co., Britton, is engineer.

DeCamp Consolidated Glass Casket Co., Muskogee, Okla., J. W. DeCamp, president, is considering three-story addition, 75 x 150 ft., to cost more than $90,000 with equipment.

Forrest City Cotton Oil Co., Forrest City, Ark., is planning one-story addition to cottonseed oil mill, to cost about $55,000 with equipment. Philip Hickey is general manager.

Ovens, power equipment, conveying and other machinery will be installed in four-story baking and coffee roasting plant to be erected by Bird Stores, Inc., 2101 Broadway, Kansas City, Mo., to cost about $220,000. Contract for superstructure has been let to John T. Thompson Construction Co., Huntzinger Building. Archer & Gloyd, Pioneer Trust Building, are architects; Hans von Unwerth, Finance Building, is mechanical engineer.

Fort Smith Gas Co., Fort Smith, Ark., is contemplating construction of pipe line from natural gas field at Lavaca to city limits, to cost about $100,000 with pressure stations, etc. A. Graham Williams is general manager.

Davis Boring Tool Co., 6200 Maple Avenue, St. Louis, has been incorporated to take over business of Davis Boring Tool Co., division of Larkin Packer Co., manufacturer of standard and special boring tools, blocks, cutters and reamers. B. J. Jostrand is secretary.

Detroit

DETROIT, Sept. 30. — North-Moeller Co., West Cortland Avenue, Jackson, manufacturer of grinding wheels and other abrasive materials, has awarded general contract to Macklin Co., Wildwood Avenue, for one-story addition, to cost about $60,000 with equipment.

Hastings Mfg. Co., Hastings, manufacturer of automobile equipment and accessories, will erect one-story addition, 65 x 320 ft., to cost more than $85,000 with equipment.

City Council, Battle Creek, plans extensions at Kellogg municipal airport, including construction of several new hangars, with shop and reconditioning facilities and other field units, to cost more than $80,000 with equipment.

Koestlin Tool & Die Co., 3601 Humboldt Avenue, Detroit, is taking bids on general contract for one and two-story addition, 65 x 120 ft., to cost about $60,000 with equipment. Muller & Krecke, American Radiator Building, are architects.

United Brass & Aluminum Mfg. Co., Port Huron, is considering rebuilding, part of plant recently destroyed by fire.

Venton Steel Sash Co., Sixth Street, Muskegon, manufacturer of steel sash doors, etc., has rejected bids for two one-story additions, and will have revised plans drawn at once, entire project to cost about $80,000 with equipment. A. A. Wickland & Co., 205 West Wacker Drive, Chicago, are architects.

Grand Trunk Railway Co., 400 East Jefferson Street, Detroit, is completing plans for electrification of four-track road from Detroit to Pontiac, to cost more than $2,500,000 with equipment.

Chrysler Corporation, 12200 East Jefferson Street, Detroit, has approved plans for a one-story machine shop 150 x 160 ft., to cost about $85,000 with equipment.

Detroit Steel Products Co., Mound and Lynch Roads, Detroit, has begun erection of new plant group to cost more than $500,000 with equipment. Work will in-

clude one-story power plant. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

Board of Trustees, State of Michigan College of Mining and Technology, Houghton, will soon take bids for three-story addition to mechanical and electrical engineering building, to cost $340,000 with equipment. Derrick Hubert, 801 Sheridan Road, Menominee, is architect.

City Council, Allegan, Mich., has plans for municipal hydroelectric generating station, to cost about $500,000 with equipment, and will proceed with project at early date. Ayres, Lewis, Norris & Mays, Ann Arbor, are engineers.

Saginaw Foundries Co., Saginaw, Mich., has been incorporated with capital of $200,000 to manufacture electric steel and gray iron castings. It has taken over a plant containing a gray iron foundry and is remodelling part of building for production of electric steel castings. Company should be addressed care of Wickes, Stork & Pletscher, Saginaw.

Milwaukee

MILWAUKEE, Sept. 30.—Sales of machine tools are holding up to the recent level, but the volume of inquiries has fallen off. Manufacturers of agricultural implements and tractors are at nearly peak production. There is still a shortage of skilled mechanics.

Caswell Mfg. Co., 1000 St. Paul Avenue, Milwaukee, maker of portable electric phonographs, electrical pickups and other specialties, has leased a floor at 470-488 Virginia Street, about 20,000 sq. ft., for expansion.

H. W. Buemming, architect, 521 Jackson Street, Milwaukee, is taking bids for a three-story and basement factory, 63 x 134 ft., at West Allis, for Christian Hansen's Laboratories, Little Falls, N. Y. Two boilers, 10,000-gal. tank and cold storage facilities will be installed.

L. C. Hirshheimer, Inc., La Crosse, Wis., gray iron castings, has under construction first unit of a new plant, 80 x 180 ft., to cost $50,000.

Great Lakes Coal & Dock Co., Superior, Wis., will build dock No. 2 at Allouez Bay to cost about $500,000. M. J. Bartelme is superintendent and Roland C. Buck, Inc., United States National Bank Building, Superior, is engineer.

Indiana

INDIANAPOLIS, Sept. 30. — Contract has been let by Horat Brothers Machine co., Ferry Street, Lafayette, manufacturer of machinery and parts, to Schroyer & Parker, Farmers' & Traders' Bank Building, for one-story addition, 60 x 100 ft., to cost about $24,000 with equipment.

Bendix Aviation Corporation, South Bend, manufacturer of accessories for airplanes and automobiles, has approved an expansion program to cost more than $600,000, including erection of several multi-story factory units, one-story foundry, housing development for employees and other work. It is understood that part of new buildings will be used for affiliated organizations, including Bendix Brake Corporation.

Hartford City School Board, Hartford City, has plans for a new vocational training school, to cost about $100,000 with equipment. Houck & Smenner, 108 East Washington Street, Muncie, are architects.

Capehart Automatic Phonograph Co., East Pontiac Street, Fort Wayne, has taken bids on general contract for one-story addition for assembling and other work, to cost about $35,000 with equipment. Charles R. Weatherhogg, 250 West Wayne Street, is architect.

Bunnell-Moorhan Motors, Inc., 598 Hohman Street, Hammond, has plans for two-story service, repair and garage building, to cost $140,000 with equipment. L. C. Bernard, First Trust Building, is architect.

Board of Trustees, Indiana University, Bloomington, plans rebuilding part of power plant destroyed by fire Sept. 24.

Gulf States

BIRMINGHAM, Sept. 30.—Contract has been let by Cameron Iron Works, Inc., 711 Milby Street, Houston, Tex., to Truscon Steel Co., 1701 Oliver Street, for one-story unit, 100 x 102 ft., to cost about $35,000 with equipment.

Markle Steel Co., Shepherd Street, Houston, Tex., has plans for one-story shop addition, 100 x 125 ft., to cost about $75,000 with equipment. Giesecke & Harris, Second National Bank Building, are architects.

Company has been organized at Mount Calm, Tex., Hill County, under direction of local Commercial Club, H. M. Keeling, secretary, to construct an oil refinery on local site. Initial unit will be equipped to handle about 500 bbl. of crude oil per day, and will be supplemented with other units later, entire project to cost more than $150,000 with machinery. R. C. Pool, cashier of First National Bank, Mount Calm, and L. D. Mitchell, San Antonio, Tex., are interested in project.

Alabama Power Co., Birmingham, is arranging for expansion at Gadsden, Ala., to include installation of new equipment in power substations and switching plants, and construction of transmission lines; electric traveling cranes will be installed. Project will cost more than $450,000.

Continental Gin Co., Fourth Avenue South and Forty-sixth Street, Birmingham, manufacturer of cotton-ginning machinery, parts, etc., has awarded general contract to D. T. Underwood, Pioneer Building, for three-story addition for storage and distribution, 81 x 200 ft., to cost about $100,000 with equipment.

Orleans Parish School Board, City Hall Annex, New Orleans, will install manual training department in new three-story school to be erected at Algiers, to cost over $175,000, for which bids are being asked on general contract until Oct. 11. E. A. Christy is supervising architect for board.

Food Machinery Corporation, Tampa, Fla., has purchased local plant and business of Skinner Mfg. Co., manufacturer of citrus packing house machinery and parts. New owner plans expansion.

National Electric Mfg. Co., Florence, Ala., manufacturer of electric stoves and ranges, is considering removal of plant to Jackson, Miss., where capacity of about 500 units per month will be increased. It is understood that company will be reorganized with W. H. Jolly, Florence, as president, and T. B. Cabell, Jackson, vice-president.

Texas-Louisiana Power Co., Fort Worth, Tex., has begun construction of an addition to steam-operated electric generating plant at Pecos, Tex., with installation of new engine unit and auxiliary equipment, to cost over $100,000; transmission lines will be extended.

City Council, Ocala, Fla., and Board of County Supervisors have approved plans for city-county airport, to include hangar, repair shop, oil storage and other field units, to cost more than $70,000 with equipment. J. E. Walker, County engineer, will supervise installation.

Crane Co., 836 South Michigan Avenue, Chicago, has plans for three-story factory branch and distributing plant, 100 x 105 ft., at Jacksonville, Fla., to cost over $75,000 with equipment. Marsh & Saxelbye, Consolidated Building, Jacksonville, are architects.

Austin Bridge Co., 1813 Clarence Street, Dallas, Tex., has plans for a one-story steel fabricating works, to cost more than $80,000 with equipment.

Cincinnati

CINCINNATI, Sept. 30.—Metal Aircraft Corporation, Cincinnati, manufacturer of airplanes, with plant at Lunken airport, has been acquired by new interests headed by Robert H. Schryver, Columbus, Ohio, which will take over and operate property at once. Plans are being completed for acquisition of Johnson Airplane Supply Co., Dayton, Ohio, manufacturer of aircraft parts, by same interests, and two companies will be consolidated. Mason & Dixon Air Lines, Inc., Cincinnati, will be included in merger. Plant of Metal Aircraft Corporation will be increased for additional output.

Hobart Mfg. Co., Troy, Ohio, manufacturer of meat choppers, etc., is planning to produce a line of meat and bread slicers and kindred edge tools. Plans have been filed for a one-story addition to cost about $20,000. H. L. Johnston is president.

Frigidaire Corporation, 334 North Taylor Street, Dayton, manufacturer of electric refrigerators and refrigerating units, has filed plans for one-story addition, to cost about $30,000 with equipment. Company is a subsidiary of General Motors Corporation.

Dayton Airplane Engine Co., 1246 Leo Street, Dayton, manufacturer of aircraft engines and parts, is considering a one-story addition to cost about $70,000 with equipment, and contemplates an expansion program to cost over $400,000. Company has purchased Eastern Aircraft Corporation, Pawtucket, R. I., manufacturer of all-metal airplanes of German (Messerschmitt) type, and will operate as a unit of organization.

Pritchett-Thomas Co., Stahlman Building, Nashville, Tenn., has awarded general contract to Foster & Creighton, Fourth and First National Bank Building, for six-story and basement automobile service, repair and garage building, 100 x 175 ft., to cost about $450,000 with equipment. Marr & Holman, Stahlman Building, are architects.

Leland Electric Co., Dayton, Ohio, manufacturer of fractional horsepower electric motors, parts, etc., has disposed of a stock issue totaling $356,250, part of proceeds to be used for expansion. Company recently completed new plant unit.

Pacific Coast

SAN FRANCISCO, Sept. 26.—Plans are being considered by American Pipe & Steel Corporation, Alhambra, Cal., for extensions and improvements in plant, to cost about $55,000 with equipment.

John and Donald B. Parkinson, Title Insurance Building, Los Angeles, archi-

tects, have plans for one-story automobile service, repair and garage building, 100 x 250 ft. to cost $100,000 with equipment.

Pacific Telephone & Telegraph Co., 740 South Olive Street, Los Angeles, has purchased property at Ventura, for one-story equipment storage and distributing plant, 200 x 200 ft., to cost over $75,000 with equipment. A mechanical department will be installed.

American Can Co., Hunter-Dulin Building, San Francisco, has awarded general contract to Lindgren & Swinerton, Inc., 225 Bush Street, for four-story addition, to be used in part for storage and distribution, to cost about $100,000 with equipment. Company engineering department is in charge. Headquarters are at 120 Broadway, New York.

M. & M. Plywood Co., Longview, Wash., has approved plans for initial unit of new one-story mill, 200 x 400 ft., for manufacture of veneer and plywood specialties, to cost over $80,000 with equipment. Malarkey & Kallander, Postal Telegraph Building, Portland, are architects and engineers.

Firestone Tire & Rubber Co., Akron, Ohio, has plans for a one and one-half story factory branch, storage and distributing plant at Eugene, Ore., to cost about $100,000 with equipment.

Utah Oil Refining Co., Salt Lake City, Utah, is contemplating extensions and improvements in oil refinery to cost more than $350,000 with equipment.

American Concrete Pipe Co., San Diego, manufacturer of heavy concrete pipe sections of large diameter, will begin construction of new plant at Old Town, to cost $100,000 with equipment.

San Francisco Bay Airdome, Inc., care of Lynn Schloss, 1541 Webster Street, Alameda, Cal., engineer, will soon take bids for a new airport near Estuary Tube, consisting of three steel hangars, repair and reconditioning shops, oil storage and other field units, to cost over $600,000 with equipment. James A. Talbott, an official of Richfield Oil Co., San Francisco, is president.

Western Gear Works, Seattle, and Pacific Gear & Tool Works, San Francisco, have been merged. Companies will retain separate identity and there will be little change in personnel, but each will have benefit of patents, patterns, engineering and plant facilities of other.

Banta Ornamental Iron Shop, 122 West Twenty-eighth Street, Los Angeles, has been incorporated to continue manufacture of wrought iron specialties made by company for past year.

Canada

TORONTO, Sept. 30.—Superior Alloys, Ltd., Sault Ste. Marie, Ont., has awarded contract to McLarty Brothers, for erection of a plant to cost $75,000. Two electric furnaces will be installed.

Quebec Railway, Light, Heat & Power Co., 265 St. Joseph St., Quebec, will start work before close of year on erection of a substation to cost $650,000.

Barry & Ostler, Kirkcaldy, Scotland, contemplate erection of a linoleum manufacturing plant at Farnham, Que., work to start next spring.

Noranda Mines, Ltd., Rouyn, Que., has plans for a five-story plant at Levis, Que., to cost $350,000. Tenders will be called during winter for construction and equipment.

Work has started on the erection of a plant at Simcoe, Ont., for American Can Co., to cost $1,000,000. J. F. Abbey is engineer.

Canadian Paper Board Co., 32 Front Street West, Toronto, has awarded contract to Stephens Engineering & Supply Co., 25 St. Patrick Street, for an addition, to cost $60,000. Kerry & Chase, Confederation Life Building, Toronto, are engineers.

Dominion Wheel & Foundries Ltd., 121 Eastern Avenue, Toronto, has awarded contract to J. R. Page, 18 Toronto Street, for a machine shop and garage to cost $70,000. James Proctor & Redfern Ltd., 36 Toronto Street, is engineer.

Plant of Morash Stove Co., Morrisburg, Ont., was recently destroyed by fire with a loss of about $100,000. Owner contemplates rebuilding.

Stoughton Co., Stoughton, Wis., manufacturer of automobile bodies, is having plans prepared for erection of a sub-assembly plant at Regina, Sask.

Foreign

PLANS are being arranged by Eisler Electric Corporation, 750 South Thirteenth Street, Newark, recently formed to take over and expand Eisler Engineering Co., Inc., same address, manufacturer of machinery for production of radio tubes, incandescent lamp machinery, etc., for establishment of a branch plant in Germany, to manufacture similar equipment, including radio apparatus. An existing works will be acquired and developed to cost more than $100,000. Charles Eisler, president, has sailed for Europe to complete arrangements.

German General Electric Co., A. E. G., Berlin, has purchased controlling interest in National Electric Light Co., Panama, Panama, and will operate as a subsidiary. Plans are under way for expansion in power and transmission facilities.

Command-Aire, Inc., Little Rock, Ark., manufacturer of aircraft for military and commercial service, is completing plans for establishment of branch assembling plant at Santiago, Chile, one-story, to cost over $80,000 with equipment. It is proposed to have unit ready for service in January. Robert B. Snowden is president.

Mexican Mineral Co., Mazatlan, State of Sinaloa, Mexico, has work under way on a new smelting plant on local site for production of silver, zinc and other metals, to cost more than $175,000 with machinery.

Continental Can Co., 1 Pershing Square, New York, has purchased plant and business of Sociedad Industrial de Cuba, S. A., Havana, Cuba, and will operate as a subsidiary, including division for manufacture of bottle caps.

Thompson Products, Inc., 2196 Clarkwood Road, Cleveland, manufacturer of valves, pistons, brake rod assemblies and kindred automotive products, has purchased a controlling interest in S. A. des Etablissments Mecaniques Monopole, Ltd., Paris, France, manufacturer of similar products, with plant at Poissy, a suburb of Paris, totaling 100,000 sq. ft. floor space. Purchasing company will continue operation as a foreign subsidiary, and plans expansion. Considerable equipment will be produced under Thompson specifications, including pistons and piston rings. Charles E. Thompson is head of acquiring company.

New Trade Publications

Condensate.—W. B. Connor Co., 369 Lexington Avenue, New York. Booklet of 40 pages devoted to the draining of condensate from steam lines and steam-using apparatus. The booklet is in the nature of a treatise, illustrated, and giving particulars of equipment for doing the work outlined above.

Rotary Gas Exhausters.—Connersville Blower Co., Connersville, Ind. Bulletin 201 of 12 pages illustrates and describes exhausting units for service in by-product coke plants, gas plants, oil refineries, chemical manufacturing and other industries. These exhausters displace from 16,000 to more than 1,000,000 cu. ft. an hour of air or other gases.

Foundry Ovens.—Gehnrich Oven Co., Long Island City, N. Y. Bulletin of 16 pages, profusely illustrated, devoted to ovens for core baking, mold drying, pasting, blacking, pre-heating, aging, normalizing, etc. Many of the illustrations show applications in service.

Machine Forging.—Kilborn & Bishop, New Haven, Conn. Pamphlet of 20 pages by Holloway Kilborn, reprinted from a series of articles in THE IRON AGE in April and May, 1929. This describes equipment used for forging by machinery, the design of dies and other parts, and tells how the operations are best performed.

Hot-Blast Temperature Control.—Bristol Co., Waterbury, Conn. 24-page brochure describing equipment for maintaining blast furnace bustle pipe temperature at even heat. Air from stoves is normally superheated, and the temperature lowered by bypassing a regulated volume of wind from blowing engines direct to blast main.

Havemeyer Trusses.—Concrete Steel Co., 42 Broadway, New York. A 32-page pamphlet illustrating and describing in detail a form of truss for concrete floors and roofs which is said to give considerable construction economy. The truss is a built-up member based upon the design theory employed in bridges. Its weight for a given load capacity is said to be less than that of other types of floor members.

Recording Psychrometers.—Bristol Co., Waterbury, Conn. Catalog 2100 of 16 pages, accompanied by a four-page list price, illustrates and describes recording psychrometers of various types and shows the forms of chart produced by the instruments. A relative humidity table connecting up the wet bulb and dry bulb readings is given.

Alloy Cast Iron.—International Nickel Co., New York. A 12-page illustrated leaflet entitled "Nickel Cast Iron, Theory and Practice" contains ten studies on the results of the use of nickel in cast iron. To each study is devoted one page which, in parallel columns, gives the theory and the practice as well as illustrations of the product of certain compositions containing various amounts of nickel.

Steel Castings.—Sivyer Steel Castings Co., Milwaukee. A four-page leaflet in a series of "Sivyer Reports" is entitled "When Steel Replaces Gold." It is an argument for the use of electric steel castings with reference to the effect of cost, sales and business control upon

the gold in the profit coffers at the end of a year.

Alloy Steel.—International Nickel Co., New York. Under date of July 1, 1929, this company has issued a 12-page bulletin entitled "Buyers Guide" for nickel alloy steel products. It gives in detail the companies which produce all kinds of steel materials which contain nickel.

Steel Castings.—Lebanon Steel Foundry, Lebanon, Pa. A 4-page bulletin, illustrated, is devoted to the subject "Lebanon Steel Castings Speed Production." It discusses in general the claim that Lebanon steel castings are carrying heavy overloads successfully for various applications in trucks, tractors and special equipment for transmitting materials.

Steel Castings.—Nugent Steel Castings Co., Chicago. Bulletin No. 120 of two pages has been issued as an index of the bulletins issued by this company, an index revealing the various subjects discussed in the over 100 bulletins issued by the company.

Fuel Burning and Steam Generating Equipment.—Combustion Engineering Co., 200 Madison Avenue, New York. Catalog GC-5 of 16 pages, illustrated, describes briefly the more important fuel burning and steam generating equipment made by this company. Many sectional views are shown. Some of the illustrations show installations in use.

Wire Cloth.—Newark Wire Cloth Co., 365 Verona Avenue, Newark, N. J. Bulletin of four pages illustrating a variety of meshes of wire cloth, varying from an opening 1 in. square to 400 to the inch (160,000 to the square inch). Sieves and foundry riddles are featured.

Electronic Tornado.—Lincoln Electric Co., Cleveland. Folder describing automatic welder mounted on small carriage designed to travel along seam on pipe or flat tank bottom.

Hard Welding Rod.—Fusion Welding Corporation, Chicago. Bulletin No. 3 describes the application of "Weldite Type-T" welding rod, an intrinsically hard alloy which when deposited on a cutting tool or surface to resist abrasion has a Brinell hardness of 600 to 625 and considerable toughness.

Perlit High-Test Cast Iron.—Dursar Corporation, Newark, N. J. Folder reproducing microphotographs of Perlit iron, gun iron, and gray iron, listing physical characteristics, uses, and manufacturers of the first mentioned.

Crucible Steel Co. of America has published a booklet entitled "Quality Aircraft Steels," listing the products it makes for use in airplanes and engines, these including special steels for camshafts, connecting rods, crankshafts, cylinders, fuselage strut fittings, frame reinforcements, landing gear parts, magneto parts, push rods, valve guides, gears, etc. A list of airplane and airplane engine builders now using Crucible steels is also given.

The Division of Simplified Practice, Department of Commerce, has sent to manufacturers, distributers and users of die-head chasers requests for acceptance of the revised program of simplification adopted at the meeting of the National Machine Tool Builders, held at Asheville, N. C., in the week of May 20

The Week's News Quickly Told

Current Events That Bear on the Course of Business

TRADE continues seasonably good, although a note of conservatism characterizes many reports. Atlantic Seaboard States are generally hopeful; the heavy manufacturing regions in the Central West are a little slack; the advanced prices for stock and grain nearly compensate for the slender crops in the Northwest. Pacific Coast industries are going at a good pace with the exception of lumber. (Some 200,000 acres of National forest have been burned in recent forest fires.)

* * * * *

STOCK market is nervous and unstable. Brokers' loans increased to record height—$6,760,000,000. Money rates for commercial purposes are generally high. Bank of England, in order to check gold export, raises discount rate from 5½ to 6½ per cent. Many British business men are blaming such high rates for the tardy trade revival.

* * * * *

INTERNATIONAL trade will doubtless follow the resumption of diplomatic relations between Russia and England, announced Saturday . . . Bolivia faces an economic crisis due to slack consumption of tin, which forms 90 per cent of her exports . . . Dr. Carl Duisberg, addressing the German Federation of Industries, says that the Pacific Ocean is becoming the center of world economics due to the ascendency of American capital and political interests and the rapid industrial advance of Japan . . . Senor Negri, Mexican Minister of Commerce believes that when private enterprise ceases to operate, the nation should take charge of the stagnating industry to prevent damage to the national economy.

* * * * *

RAILROADS on the average report 10 per cent higher net income in August than in 1928, and employees are paid at the highest rates since 1920. Even so, a 6 per cent increase in freight rates is necessary, in the opinon of R. N. Collyer, chairman Trunk Line Association, because the railroads have made money since 1922 only by better operating efficiency and an increase of $5,000,000,000 in capital—measures which have about reached their limit. Average freight carload (27.3 tons), daily freight car travel (32.1 miles) and freight train speed (13.4 miles per hour) are all made records in July. Railroads are also using motor coaches three times as much as last year, and are steadily extending the mileage of motor freight trucks. Trucks to handle all freight to and from metropolitan destinations via "inland" freight houses from railroad terminals in suburbs is the plan approved by Port of New York Authority and Eastern roads.

* * * * *

AIRCRAFT does not compete with railroad for passenger traffic, says W. D. Storey, president Santa Fe railroad, because the fares are three times as high . . . German Reichstag voted a large credit to the Lufthansa for a trans-Eurasian line of Zeppelins. Sir Charles Burney, builder of the British dirigible R-100, has designed a much bigger ship with a bottom like a ship's hull for docking on the water and for carrying 400 passengers.

* * * * *

FLYING in fog will be safer when using more sensitive altimeters, new directional gyroscopes and visual radio beacons—all instruments proved by a 15-mile "blind" flight for the Guggenheim Fund for Promotion of Aeronautics . . . The first airplane, Amsterdam to Dutch East Indies, completes its 10-day trip on time. One plane a week is the schedule.

* * * * *

SHIPPING Board loans $17,000,000 for construction of two passenger liners and five tankers . . . Meanwhile the White Star line stops work on its 60,000-ton ship, to study the new conditions in trans-Atlantic traffic created by the Bremen's exploits. Smaller and speedier craft are probably the more profitable in that trade . . . Speed is not everything, however, for half the world's tonnage built since 1920 has been for less than 12 knots . . . In 15 years the Panama Canal collected $224,000,000 tolls, about two-thirds the cost. Yet maintenance and interest charges are so high that it will be 85 years before the debt is extinguished.

* * * * *

LABOR and employers must cooperate to bring higher wages, and shorter hours and to abolish company housing. This will solve the textile troubles, said Governor Gardner of South Carolina . . . To help eliminate the sweat shop, J. Practical Aspects of Spark Testing

Large Steel Company Uses It to Sort Tons of Plain Carbon and Alloy Steels—Training a Spark Tester

BY WALTER G. HILDORF AND C. H. MC COLLAM*

EITHER an outline of its history, or a bibliography extending as far back as space will permit, is often the inevitable introduction to a technical subject. In the case of spark testing such an introduction is necessarily brief as, up to quite recently, there has been very little written on the subject. Probably the earliest reference is that quoted by Brearly in "The Heat Treatment of Tool Steel," wherein a French metallurgist, writing in 1804, comments on the variation in sparks from different steels. As a matter of fact, up to more or less recent times there was little or no practical use for such methods as spark testing. Tonnages were much lower, there were comparatively few grades of steel, and time was not such an important factor. Under the circumstances it is hardly surprising that the interest in the possibilities of spark testing was largely academic.

During recent years there has been a decided change. A large number of steels of different analyses have come into existence, tonnages have increased enormously, and time has become a matter of vital importance. As a result considerable interest has developed in cheap, or rapid, methods of segregating steel of different composition, as a measure of protection to the user.

It is hardly necessary to go into detail as to what happens when foreign steel does get mixed into an order, except to say that the results are very apt to be unfortunate. Protective measures are particularly important in the case of mills producing many different alloys on a quantity basis; it is practically impossible to devise a production sys-

CHARACTERISTIC Spark from a 0.30-Per Cent Carbon Steel. The bursts are more intense and there are small secondary bursts (below)

CHARACTERISTIC Spark from a 0.15 Per Cent Carbon Steel. The bursts are quite simple (above)

CHARACTERISTIC Spark from a 0.45-Per Cent Carbon Steel. Both the frequency and intensity of primary and secondary bursts are greatly increased

tem that is absolutely fool proof. At the plant of the Timken Steel & Tube Co., spark testing seemed to afford a great many possibilities as a method of checking steel, and therefore considerable work has been done to develop it as a practical process.

Scope and Limitations Outlined

BEFORE considering what has been accomplished, a brief discussion of the scope and limitations of the method may be of interest. Spark testing, from a practical standpoint, is a method of sorting different grades of steel according to the form of spark thrown off when they are ground. When applied with care to the sorting of certain definite classes of steel, it offers a reliable, fast, cheap and adaptable means of classification.

It is not, however, a test of the quality of the steel, for it will not detect laps, cracks or seams, nor will it determine hardness or grain size. It should not be used, as it sometimes is, for identification of steels selected at random. Its value lies in the fact that once two kinds of steel, whether in billets, bars, or tubes, or even in machined parts, have been mixed, it is almost impossible to tell from outward appearance which is which. The spark test may be applied to the sorting of steels so mixed, or it may be used as a safeguard against possible mixups of this sort. It is in the latter capacity that it has found its greatest usefulness in the Timken Plant.

Advantages Are Numerous

Spark testing has numerous advantages over other methods of sorting, although it does not always replace such methods. For example, while chemical analysis is an absolutely definite method of sorting, it is only practicable where a small number of pieces of large individual mass are concerned. Such cases would be largely restricted to ingots, large forgings, or blooms. Where it is a matter of smaller pieces, especially in the case of machined parts, even if it were possible to take samples from the individual pieces the analysis would probably cost more than the parts were worth.

Hardness tests, such as Brinell, Rockwell, and scleroscope require somewhat more time than spark testing and, where steels have the same carbon content, are practically worthless. Fracture determination is positive, as two steels will seldom show the same fracture, but the fractured piece has to be scrapped, which limits the practical value of the test. The use of the spectroscope requires as much technique as spark testing, and the instrument is much more expensive and is not conveniently portable.

The basic theory on which spark testing is founded is sound chemistry and physics. When steel is held on a grinding wheel, small particles of the metal are torn loose, and if the tearing is sufficiently violent the temperature of the particles rises considerably. This is a matter of physics—temperature rise in accordance with work done. As the hot particles fly through the air at high speed, they come in contact with a great deal of oxygen. As a result, as the individual particle proceeds, its iron is oxidized, becoming iron oxide.

Theory of Spark Testing Offered

OUR theory is that if there is carbon present, it combines with the oxygen to form carbon dioxide gas at a rate faster than that at which the iron oxide is formed. Since the carbon dioxide gas occupies greater volume than the original carbon, and the iron is soft and plastic at the high temperature reached, the carbon

CHARACTERISTIC Spark from a 1.00-Per Cent Carbon Steel. The primary bursts resemble small explosions and the secondary ones show even further or tertiary bursts

dioxide will escape into the surrounding air, carrying with it minute particles of iron.

In other words, there will be a series of secondary sparks. As the percentage of carbon increases the number and intensity of the bursts becomes greater, until with 1 per cent carbon steel they are distinct explosions. Or, as the proportion of carbon increases, the proportion of CO_2 gas to the weight of the metal increases, and the ability of the gas to throw small particles of metal off at a tangent to the spark line becomes greater.

The sparks given in first four illustrations show how the size and intensity of the bursts increase with a growing percentage of carbon. As a further confirmation of the theory, microscopic examination of the cooled particle will show small craters produced presumably by the escape of the CO_2.

In modern practice carbon is only one of several elements that may be present in a given steel, so that the carbon spark alone is not a trustworthy basis for sorting. In fact it may frequently happen that the tester will be called upon to sort two steels of the same carbon content, but differing with respect to the other alloys included. Fortunately most of these alloys either have characteristic effects of their own, or their presence has an effect on the carbon bursts that is easily recognizable.

As an example, the nickel-molybdenum spark given at right shows several marked peculiarities. The spear point at the end is always found when molybdenum is present, and the slight swelling in the carrier line near its beginning is characteristic of nickel. Actually this swelling is a spot of intensely white light, easily noted against the characteristic orange color of the normal carrier line. Nickel also has an inhibiting effect on carbon bursts, their absence, or comparative weakness, being another indication of its presence. The other alloys, chromium, manganese, etc., also have certain characteristic effects.

Shower of Sparks Examined in Three Areas

In ordinary practice the entire shower of sparks thrown from the wheel, or what is termed the "spark picture" is carefully examined. The whole picture is divided into three equal areas: The portion nearest the wheel, that in the middle, and that farthest from the wheel. Each is examined individually for salient features. These features, which are the variables upon which recognition is based, may be divided into three groups: (a) carrier lines, (b) spark bursts and (c) characteristic sparks.

As to the first, the carrier lines, which are the glowing streaks left by the iron particles, form the background of the spark picture. They may vary in length, breadth, color, and number of lines per picture. Spark bursts are found throughout the length of the carrier line. They will vary in number, size, intensity, shape, and distance from wheel to first burst, or from last burst to tail spark. The matter of characteristic sparks has already been discussed.

Training a Spark Tester

The first thing the tester must learn is to concentrate on one area of the picture at a time. Next he must learn to watch only those sparks that cross his line of vision, or, to keep his eyes fixed on a certain point and "catch" the sparks as they pass that point. Thus he will form a mental picture that gradually becomes clearer until he notes the details of the bursts, which he can visualize after they have died out. He confirms this mental picture again and again until he has definitely classified the spark with a known standard.

For practice with beginners it is better to start with two steels of known analysis, preferably with widely differing carbon content, and no alloys present. After an operator has had sufficient experience with different sparks he will soon develop the speed and confidence necessary to sort a great many different kinds of steel. It is a help to accurate work if he can be taught some of the reasons for spark variations. If he has some conception of these principles, he will be better equipped to detect variations among steels of somewhat similar characteristics.

If spark testing is to be accorded proper recognition, it must be absolutely infallible on any job to which it is applied. This means that the personnel must be well trained, but it also means that spark testers cannot be

CHARACTERISTIC Spark from Nickel-Molybdenum Steel. The "spearpoint" on the end of the carrier line is indicative of molybdenum and the swelling in the carrier line of nickel. Note the absence of carbon bursts, which is another indication of the presence of nickel

selected at random. It is well known that only a certain percentage of the men found in the average employment office are capable of development into steel inspectors. By the same token, not every inspector can be taught spark testing. The first requisite is, of course, good eyesight, but in addition the eyes must be "light-sensitive". The distinguishing of sparks is a matter of differences in the light rays thrown off, and it is frequently very fine variations that identify types of steel. Furthermore there is no room on a spark testing crew for men inclined to haphazard work.

If steel is to be sorted, it must be thoroughly sorted; every foreign piece must be taken out. The man who is apt to become careless after checking thousands of pieces in a day without finding a bad one simply does not belong on a spark-testing crew. On the other hand the one piece of steel of different analysis that comes up after a thousand pieces of OK stock will stand out like a red flag to the properly trained spark tester. It is not uncommon for a spark tester working on small pieces

in lots of a thousand to be four or five pieces beyond a bad one before he can stop. His muscular reactions become so automatic that they cannot be changed for several seconds, nevertheless the picture of that one foreign spark will register so clearly that there is no hesitation in sorting it out.

Equipment Which Is Necessary

ONCE spark testing had been settled upon a practical basis at the Timken Plant, the matter of equipment came in for considerable attention. The grinder which was selected as standard is the Dumore No. 1 JG grinder with 1¼ x ⅜ x ¼ 46-S wheels. The grinder complete weighs about 5 lb., and has a shaft speed of 15,000 r.p.m., giving it a peripheral speed of about 5000 r.p.m.

The grinders have been specially adapted for the work by the Commercial Tool Co. by the addition of an aluminum handle parallel to the shaft. The handle is equipped with a push button switch for controlling the motor. Ball type oilers are used, since lubrication is an important factor. The whole is light, and readily portable, being suitable for work on tables, and light enough to be used for testing steel in racks at some distance from the ground. The small wheel running at high speed gives a very satisfactory spark shower without removing an appreciable amount of stock. In fact, it sometimes requires close examination of the piece to find the place where the grinder was applied.

Another factor taken into consideration was the protection of the operators' eyes. The wearing of glasses to ward off small particles of metal and emery is of course a basic safety precaution. But, in this case there is another factor to be considered, protection from constant subjection to injurious light rays. Dr. E. J. Fieman, the plant physician, has supplied two types of glasses for this purpose. One is the ordinary light blue glass used in hospitals, while the other is a special glass, known as "Soft-lite", in the darkest shade; a very light rose tint.

It was first thought that the work could best be carried on in a dark room, but it was soon discovered that such conditions actually induced eye-strain, probably because of the intensity of the light rays in the absence of other light. The work is now done in a little more than half light, the sparks being thrown in shadow wherever possible. It is also good practice to use a black tarpaulin, spread on the floor, as a background for the sparks.

Method Has Saved Much Money

In conclusion, it might be said that spark testing has saved thousands of dollars in various industrial plants. A record of the work done at the Timken plant, or in other plants by men trained in the Timken plant, would show close to a million pieces sparked. At the present time there are over a dozen spark testers regularly assigned to the Canton plant of the Timken Steel and Tube Co., and at the company's Wooster and Gambrinus plants. Every tube made at these plants is checked by spark testers during its final inspection, as a precaution to prevent the shipment of mixed lots of steel.

The reason for using the test on tubes, and not on bar stock is that there are many more mill operations on the former, and it is correspondingly harder to keep them from getting mixed. If any question arises as to mixed steel in lots of bar stock, it is checked by spark testing before shipment. The value of the check on both tubes and bar stock is proved by the almost total lack of complaints arising from shipments of mixed steel to users.

Hoisting Rope Fails from Abuse Rather Than Fatigue

STUDIES on rope wire should not neglect the almost intangible evidence which leads the practical man, through constant experience, to the truth which he cannot explain, in the opinion of A. T. Adam, expressed in "Notes on Wire for Mining Ropes," read before the fall meeting of the (British) Iron and Steel Institute. In his opinion wire ropes are frequently stressed beyond the safe range, and whether caused by bending, crushing, bruising, friction or wear, the rope is gradually destroyed.

Many investigators believe that ductility and high fatigue limit are most desirable. Tests on individual wires and ropes made therefrom show that the high strength induced by cold work is not always associated with a high fatigue limit; a hard drawn 0.80 per cent carbon wire in which the hardening effect of cold working had been entirely removed by annealing at 600 deg. C. still retained a fatigue limit almost as high as the cold drawn wire and had much greater ductility.

Ropes made with such annealed wire, however, were definitely inferior in endurance to bending to others made identically but of patented and hard drawn wire containing 0.35 per cent carbon (the usual material for high-grade elevator ropes). It should be remembered, too, that the first mentioned has a well marked endurance limit, whereas the slope of the curve for heavily cold drawn wire is definitely down even at 11 million cycles.

Apparent contradictions such as these led Mr. Adam to the belief that a high and well defined fatigue limit is not the most important property of wire for hoisting rope, but the capacity to resist destruction from over-stressing and wear. The internal stresses associated with cold drawing, and the fibrous structure, are beneficial in this respect, as long as the wire is not "overdrawn." Reduction of about seven wire gages is necessary to stiffen the wire, to give it uniform torsional strength, to increase the strength, and to produce fiber. Overdraft is detected by a sharp increase of the tensile strength when plotted against wire size. Curves are also shown proving that the fatigue strength of wires patented and air cooled is much inferior to those patented and lead cooled.

In discussion, E. A. Atkin said that to produce good wire ropes, attention must be given to the quality of the steel used, as is done in the United States. He suggested that users of steel generally do not pay sufficient attention to the importance of getting the best possible use out of the steel, and that there is a tendency to increase the carbon content instead of giving the low-carbon steel the proper treatment.

Dr. W. H. Hatfield challenged the statement that wire ropes are subjected to stresses in excess of the elastic range of the material, and he added that ropes should not knowingly be subjected to such stresses. He had examined many ropes which had failed and he had found that failure was often due to the method of construction of the rope.

J. S. G. Primrose noted that it was safer to use the higher rather than a lower carbon content if the risk of over-drawing was to be avoided. He recommended the late Doctor McWilliam's method of putting the wire in boiling water for a short time. If the wire were overdrawn, the torsions dropped remarkably. Another useful method lay in examining the microstructures, which gave a measure of the original grain size and the degree of the deformation which had produced the fiber length.

J. D. Brunton advised steel makers to crop their ingots a little deeper to get rid of inclusions, and better wire ropes would result.

Pickling Principles in Galvanizing

The Longer the Pickling Time, the Heavier the Zinc Coating—Tests Made to Show This Relation

BY WALLACE G. IMHOFF*

PRACTICAL picklers soon become aware of the fact that far beyond their experience lie many definite rules in pickling which are difficult to get into organized knowledge. The far reaching influence of proper pickling of iron and steel has been recognized in the last few years only. As pickling has been considered just a simple process of taking scale off, not much study has been given to the underlying principles of this art.

It has been taken for granted that the pickling department must be a miserable, disagreeable place, full of choking acid fumes and steam vapor. Such is the condition found still in a large number of plants where iron and steel are cleaned and pickled preparatory to galvanizing or tinning. But this is not at all necessary.

Conditions Affecting Steel Surfaces

Since pickling conditions affect the steel surface and this condition affects the weight of the zinc deposited as galvanizing coating, it is of interest to examine some practical features of steel surfaces. Steel surfaces are affected by the chemical composition of the steel base, by the temperature of rolling, by the treatment of the surface during and after rolling, and by the thickness of the steel sheet.

Steel sheets vary in thickness, according to the United States Standard Gage, from No. 0000000 with an approximate thickness of ½ (0.5) in., weighing 320 oz. to the sq. ft. (20 lb. avoirdupois), to Gage No. 44 with an approximate thickness of 3/640 in. (0.0046875), weighing 3 oz. to the sq. ft. (0.1876 lb.). The thickness of the steel decidedly influences its treatment in the pickling solution.

A further condition affecting the steel surface is the treatment the steel gets in rolling into sheets. This treatment is commonly known as the "finish", and the pickling time is directly affected by the kind of finish on the steel surface. To show more clearly just how the weight of the zinc coating is affected by the finish on the steel surface, and also by the length of the pickling time, a brief description of how the finishes are made will be given, and also the results of a definite test with various pickling times.

Rolling Sheet Bars Out into Sheets

Steel mill practice ends when the sheet bar enters the sheet mill. Sheet bars 30 ft. long are sheared to a

SHEETS on the Annealing Bottom, Ready to Be Covered. (Courtesy of G. A. White.) Sheet bars placed between the sheets, at intervals, provide pockets for thermocouples (above)

STRUCTURE of a Steel Sheet After Improper Annealing and the Same Sheet Properly Annealed. At left the strained elongated grains still existing from hot rolling are evident; this sheet broke in stamping. At right, after the sheet was properly annealed, the grains are shown of equiaxed form and the sheet readily withstood stamping. Both photomicrographs were magnified 100 diameters

length which is the designed width of the sheets to be made. These short sheet bars are then conveyed to the sheet mill.

Sheet rolling mill units consist of two stands, roughing and finishing (rolls). There may be 9 to 12 or more units in the sheet mill. Sheet bars placed in a pair heating furnace, or simply "pair furnace," are brought to proper temperature for rolling. The furnace is so named because the sheet bars are rolled in pairs.

When the bars are ready for rolling, the heater drops two sheet bars, a pair, over to the roughing mills. Here the bars are passed singly between chilled iron rolls, one bar at a time being passed in by the rougher to the catcher, who stands on the opposite side and returns it over the rolls to the rougher. This operation is repeated until the thickness has been reduced and the length increased the desired amount.

As the roughing-out process consumes sufficient time to cool the metal, reheating is necessary. This is done in a sheet furnace, at a much lower temperature than the bar furnace, as too much heat would cause the sheets to stick together when rolling.

Doubling the Sheets into Packs

When these single pieces, which have been elongated to some extent, at right angles with the original rolling of the bar, are brought up to the proper rolling temperature, they are placed together, one on top of the other (doubles), and again passed through the rolls until they have been reduced as much as possible in this form. After this they are separated by a workman known as the "doubler", who carries, or drops, or bends one end over to the other and flattens out the doubled end on the doubling shear.

Then the pack, as it is now known, is returned to the furnace, brought up to the required rolling temperature and the same operation at the mill is repeated until it is again reduced as thin as possible in this form.

The pack, now containing four sheets, is carefully opened, and the doubling operation again performed, with the addition that at this stage one end of the pack must be sheared off, to give a square, open end. The pack of eight sheets, which it now contains, is again returned to the furnace, and again brought to the proper rolling temperature and put through the same rolling operation, being at this point drawn out to the required length, which is arrived at by measurement. This final rolling operation gives a pack of eight sheets of black plate as near to the gage called for as it is practical to make by any method of manufacture yet devised.

"Finish" Is Put on the "Black Plate"

These operations successively transform the sheet bar into the form of a sheet, commonly called black plate. The sheets must then be finished according to the use the material is to be put to in manufactured product. The operations just described produce what is known as a red hard sheet.

Red hard sheets are the sheets as they come from the hot rolls. Sheets in this condition are called also black plate, or finished black plate. They are called also black sheets, which is a general term broadly covering all uncoated products, but which in a more restricted sense may apply to the common finishes of blue annealed and one-pass cold-rolled, annealed. Black sheets are the sheets as they come from the rolls without any special finish on them. As a general thing they have been cold rolled once, but not necessarily annealed or pickled, though usually they have been annealed.

The dividing line between sheets and plates is not sharply drawn, but depends principally upon the type of mill on which they are rolled. It may roughly be taken that plates are ⅛ in. thick and over, while sheets are thinner than this. The United States Government has set the limit of sheets at No. 10 United States Standard Gage (0.1406 in. thick).

Blue sheets are sheets which have not received any special treatment aside from bluing. This class of sheets is used for stove pipes, ovens, automobile parts, bedstead tubing, metal ceilings, gear cases, light tanks, etc.

Black is a descriptive term for the condition of sheets before pickling. The term is used also to qualify other grades of material, as black plate, black sheet, etc. If the sheets in the black condition are box-annealed, the finish is then termed close-annealed, black. Sometimes they are annealed to remove the strains set up by hot rolling.

G. A. White* has shown clearly the condition of this steel before and after the steel has been annealed. One illustration shows the sheets on the annealing bottom ready to be covered, while another shows the annealing box ready to charge into the furnace. Two photomicrographs show the structure of the steel sheet before and after annealing. In this condition the sheets are called black plate, finished black plate, black sheets, or simply hot-rolled and annealed sheets.

Rolling Sheets Without Using Heat

Cold rolling means passing unheated sheets between rolls. In this treatment the sheets generally are passed through three sets of cold rolls. Cold rolling closes up the pores, rolls down all ragged edges left by the shears, and gives the sheet a smooth, dense surface. It also tends to make the sheets more accurate in size. Almost all sheets for galvanizing have been cold-rolled once, the purpose of this being to flatten the sheets.

One-pass stock is black sheets, one-pass cold-rolled, and box-annealed. One-pass cold-rolled means finished

*A Metallurgical Study of the Steel Base as Related to Galvanizing.

by passing once through cold rolls; two-pass, twice through cold rolls; three-pass, three times through cold rolls, etc. The sheets may then be either blue annealed or box annealed. Full-cold-rolled is a term which broadly applies to all sheets that have been not only cold-rolled, after hot rolling is completed, but also cold-rolled as an operation preliminary to, or intermediate in, the hot rolling.

Different Results from Annealing

Annealing is done for the purpose of softening the sheets, and removing the strains set up by rolling. There are a number of different finishes to sheets, based upon the annealing process used in producing the finish. Black annealed sheets are sheets which have been annealed after the sheet has been hot rolled. This annealing is also termed first annealing. The finish on sheets in the black condition after receiving the box-annealing treatment is termed close-annealed, black.

Close-annealed, cold-rolled sheets have been box-annealed and cold-rolled. Box-annealed or close-annealed means that the sheets have been heated in a suitable inclosed metal box, or pot, protected from oxidation. Extra-annealed and re-annealed means that an extra annealing, in addition to the annealing after hot rolling, has been given the sheets.

This description therefore gives a good idea of the steel base for galvanizing, which is usually designated as one-pass cold-rolled steel, or simply as O.P.C.R. sheet steel for galvanizing. There are other finishes of sheet steel also used for galvanizing, but the steel most largely used is O.P.C.R., that is, one-pass cold-rolled.

Making Pails from Annealed Sheets

Before arriving at the pickling and galvanizing department the steel is sent to the forming and stamping departments, where it is made into the black metalware articles. The complete operations for pails consist of forming the sections, folding and grooving, wiring, edging, seaming in the bottom, riveting on the ears, pickling, galvanizing, bailing, striping, labeling and bundling, and shipping.

We are here chiefly interested in the kind of steel base used, the finish on the surface, and the pickling and galvanizing operations. The O.P.C.R. sheet steel having been made into a 16-quart, heavy grade, water pail, we are now ready to make a test to establish a definite pickling principle and to discover the relation between the pickling time and the weight of the zinc deposited as galvanized coating.

Methods Used in Galvanizing Test

Five batches of six dozen each (72 pails) are used for the test. They are first carefully weighed in the black condition and then are wet and weighed again, the amount of water added being noted. After this they are put into the pickling solution and the time when they went in carefully noted, as is also the time they are taken out in the pickled condition. This gives the pickling time. They are then weighed again wet after pickling, and the weight of the water subtracted. After this they are immediately galvanized, and then again weighed carefully.

Since galvanizing operations affect also the weight of coating, it is necessary to establish uniform, systematic conditions for each set of pails. This is done by timing the articles to the flux box, through the flux, submersion time, withdrawal time, and to the pile. In practice under plant conditions it was of course not possible to make all conditions absolutely identical, but it is remarkable how nearly this has been done.

A complete record of pickling operations is shown in the table, particular attention being called to the variation in the pickling time, and in the amount of zinc deposited.

This test proves the pickling principle that **The Longer the Pickling Time, the Heavier Will Be the Zinc Coating Deposited.** The same results have been definitely verified on other lines of galvanized articles, and the principle found to be the same.

Silicon Steel Requires High Temperature

Difficulties experienced in Germany in the manufacture of mild structural steels with high silicon content are described by G. Wallmann in *Stahl und Eisen*, 1928, vol. 48, page 817. Higher temperatures of melting are necessary and result in more rapid wear of the furnaces and molds. The steel pipes deeply, which involves a high percentage of discard. Higher annealing temperatures or higher finishing temperatures in rolling have to be employed for the plates, and greater care must be exercised in reheating in order to avoid cracks. It is admitted that if the reheating of the ingots has been carefully conducted, the rolling of plates of normal dimensions does not present any special difficulty.

Test Results in Pickling and Galvanizing Water Pails

(a) PICKLING RECORD

Pail, Water, Heavy Grade, 16-Qt. Size

Batch	1	2	3	4	5

Thirteen Classes of Mechanisms Convey Metal Through a Furnace

AN interesting classification of reliable mechanisms for conveying metal through a heat-treating furnace was given by E. G. de Coriolis, research engineer Surface Combustion Co., before a recent meeting of the American Society of Mechanical Engineers:

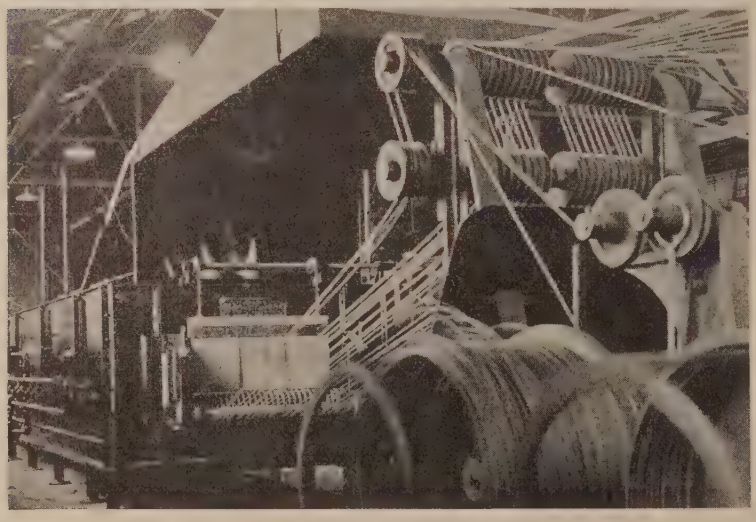
1. *Pusher*
2. *Puller*
3. *Car bottom*
4. *Conveyor chain*
5. *Conveyor belt*
6. *Rotary hearth*
7. *Rotary cylinder*
8. *Rotary retort*
9. *Spiral*
10. *Shaker*
11. *Vibrator*
12. *Walking beam*
13. *Roller hearth*

Several of these classes are shown in the accompanying views. Mr. de Coriolis's remarks on the other type are here summarized.

The conveyor belt is a recent development and has been used for the heat treatment of small parts, such as nuts, bolts and screws. Essentially this mechanism consists of a thin metal belt which is dragged over a hearth by a head pulley located in the hot zone of the furnace. The belt returns underneath the furnace, back to the charging end, where it goes over a tail pulley with tension take-up. A sufficient section of this belt is exposed outside the furnace to enable the operator to load the product uniformly so as to insure uniform heat treatment. After passing through the furnace the product discharges over the head pulley and into a quench, from which a conveyor lifts it.

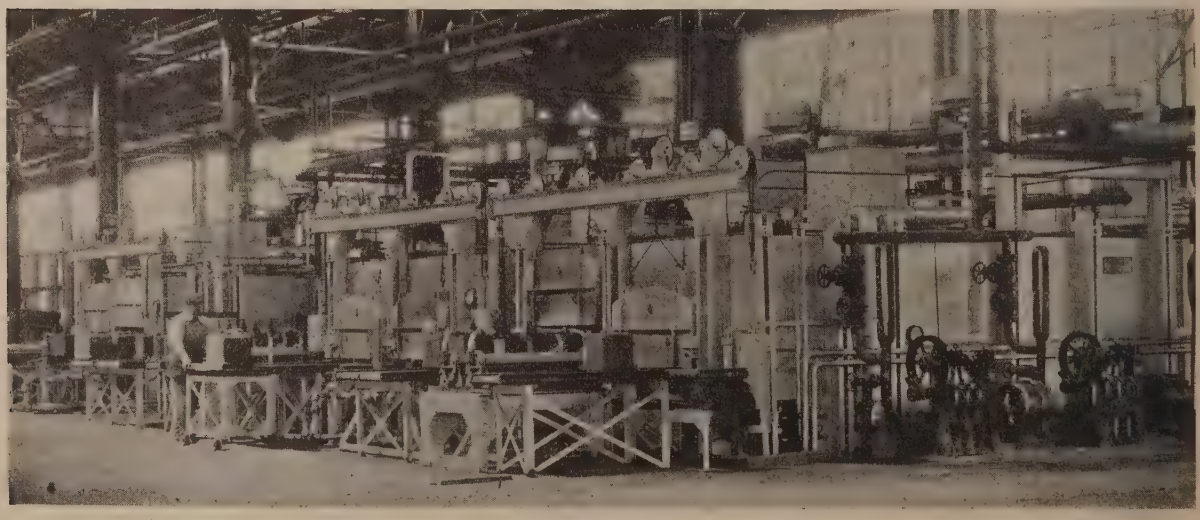
Rotary-hearth furnaces are unique in combining many advantages not possessed by other types. It need contain no alloy parts, as the conveyor mechanism is the refractory hearth itself. It can be fed and discharged through the same opening, and is, therefore, ideal for operation where the attendant is also engaged in some other and coordinated function.

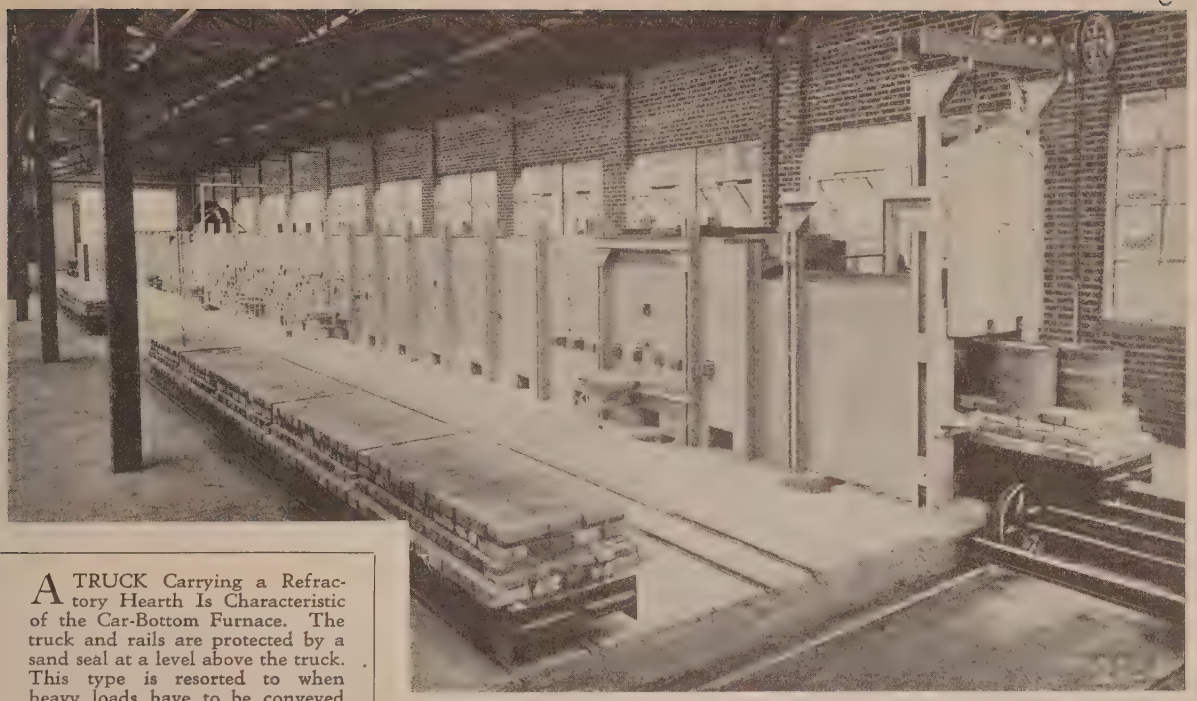
Rotary cylinders fit in best where it is permissible to fire the furnace from but a single point, namely, the dis-



THE Puller (at Left) Is Infrequently Used, as the Metal to Be Heated Is Seldom of Such a Nature That It Can Be Placed Under Tension When at Temperature. It is necessary, therefore, to use some form of a tray or pan upon which the product rests, and to this pan is attached the pulling cable, bar or chain. One other type of puller is where the product itself is pulled through the furnace, all moving parts being on the outside. This is adaptable to material of extreme length, such as wire or strip

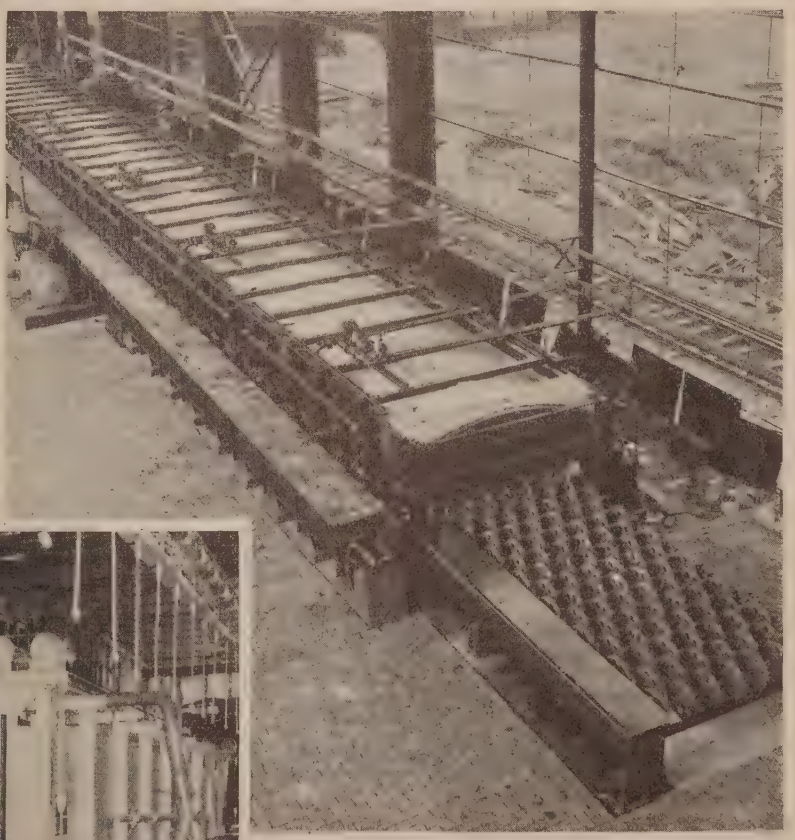
THE Pusher (Below) Is Probably the Simplest Mechanism, Involving no Moving Parts Within the Furnace, Sometimes Not Even Skid Rails in the Hearth. Pushers are utilized in this battery of recuperative counterflow carburizing furnaces

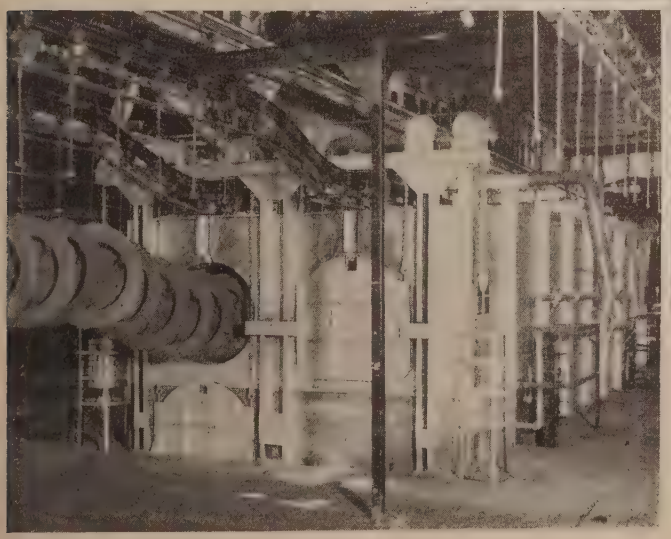




A TRUCK Carrying a Refractory Hearth Is Characteristic of the Car-Bottom Furnace. The truck and rails are protected by a sand seal at a level above the truck. This type is resorted to when heavy loads have to be conveyed through a furnace and when the heating cycle is of sufficient duration that the refractory car top is given time to come up to furnace temperature. Continuous kilns for brick and ceramic wares and furnaces for annealing and malleableizing castings are examples. (Above)

IN Furnace Construction the Conveyor Chain May Be Utilized in Several Ways. The chain may have attachments which propel the product itself along the hearth. Or the product may be placed upon a tray dragged by the chain or supported by it. An apron or stool may be fastened to the chain or supported by it, or fastened as an apron conveyor. Finally, the chain may be outside the furnace, extending over the roof, and the load, carried by suspenders through a slot in the roof, alone receiving heat. (Below)





THE Roller Hearth Possesses One Outstanding Characteristic in That It Is the Most Rapid Mechanism Yet Devised Where Extreme Length of Furnace Is Desired, and Additional Length in No Wise Complicates Its Construction. Above is an application in a steel plant for normalizing full finished auto body sheets

charge end. Like the rotary hearth, there need be no alloy parts within the furnace unless the material be abrasive to refractories. The most common example of this type is the cement kiln; its outstanding feature is the extreme lengths to which it can be designed.

Furnaces with rotary retorts have made but little progress due to a serious limitation in capacity. In this type the rotating tube projects through both ends of a cylindrical housing, which is stationary. The tube must be supported at the cold ends projecting through the furnace wall, and for this reason its length is limited by the sagging effect of the dead load at the center.

The spiral incorporates features very familiar to the rotary tube, and likewise partakes of its limitations. As the name implies, the equipment consists of a shaft with a spiral fin, which by its rotation conveys into and through the furnace such work as ring gears, which are of larger internal diameter than the spiral itself.

By "shaker furnace" is meant an alloy hearth suspended within a furnace at a slight inclination, actuated by a reciprocating motion in very much the same manner as the well known shaking screens used in various lines of industry.

The vibrator is an improvement over the above. In construction it is almost identical, except that it receives its impulse from a high speed vibrating mechanism outside the furnace, yet it is adaptable for heat treating a wide variety of miscellaneous parts.

From an operating viewpoint "walking beam" is one of the most desirable types. It requires comparatively little power to actuate it, and its motion may be so regulated as to convey the most delicate product without injury and without the use of pans, trays, or other supporting parts. It is, however, entirely dependent upon the durability of alloy parts in the heated zone, and for this reason its progress has been slow.

High-Elastic-Limit Structural Steels

A GENERAL survey of the field of manganese, silicon and nickel structural steels was described in a brief paper of the above title presented to the fall meeting of the (British) Iron and Steel Institute by J. A. Jones, Woolwich, England. He noted that carbon must be at least 0.30 per cent in order to develop a high true elastic limit, and that in any case the elastic properties will be largely dependent upon the finishing temperature or the conditions of final normalizing. Tests show conclusively that increasing the carbon content is a much less satisfactory method of securing high tensile properties than increasing the manganese content. High-carbon steels are also more affected by slight changes in heat treatment. Mr. Jones emphasizes that the two elements must be adjusted inversely; maximum manganese in a 0.20 per cent carbon steel should be 1.8 per cent, falling to 1.5 per cent with 0.35 per cent carbon, or even lower manganese in plates thinner than ¾ in.

Tests showed no advantage of a 4-per cent nickel steel over a 3-per cent. Manganese should be kept below 0.8 per cent to prevent the air-hardening effect. While small amounts of nickel increase the ductility of low-carbon steels, at least 3 per cent nickel (or an equivalent combination of nickel and chromium) is necessary to produce high-elastic-limit steel.

Thirteen mild steels containing various amounts of manganese and silicon up to 1.5 per cent were also investigated in detail. A medium-manganese steel without silicon (manganese 1.5 per cent) was better than any silicon steel containing 0.45 per cent manganese. The best combination was found to be 1.3 per cent manganese and 0.9 per cent silicon. The table indicates the types giving optimum physical properties in tests of ¾-in. bars.

Physical Properties of Best Steels

	Silico-Manganese	Medium-Manganese	Nickel
Analysis:			
Carbon	0.30	0.30	0.40
Silicon	0.9	less than 0.30	....
Manganese	1.3	1.60	0.60
Nickel	....	....	3.0
Heat Treatment (a):			
Preliminary	N 950	....	N 900
Final	N 860	N 830	N 800
Tensile Properties:			
Elastic limit	58,000	45,000	58,000
Yield point	67,000	55,000	65,000
Ultimate strength	102,000	94,000	94,000
Yield ratio	0.65	0.59	0.69
Elongation	30	32	29
Reduction in area	63	66	61
Brinell hardness	200	200	183
Izod impact	44	46	48

(a) N represents normalized (Centigrade temperatures).

In discussion, William Simons said in common with many others, his firm had made a lot of "elastic-limit" steel. To engineers, the elastic limit was often the true test of the value of steel, and he had been surprised to find great variations existing in that figure. He believed that the limit of proportionality was equally important. On the other hand, Dr. Hatfield regarded the limit of proportionality as a very unsatisfactory criterion, and he suggested the yield point as measured by Mr. Jones (i. e., that point where the permanent set equalled 0.2 per cent of the gage length) as the method by which the material should be passed.

V. B. Reichwald observed that manganese steel was getting much attention from railroad engineers in America and in England. High wheel loads are being carried, and medium-manganese steel has advantages in making rails for such heavy traffic.

Low-Alloy Copper-Chromium Steel

A new structural steel of unusual analysis has been marketed by the Dortmund Union Works, Germany, according to E. H. Schulz, writing in *Stahl und Eisen*, 1928, vol. 48, page 849. It has the following approximate composition: carbon 0.15 to 0.18 per cent, silicon 0.25, manganese 0.8, copper 0.5 to 0.8, and chromium 0.4 per cent.

It is stated to have mechanical properties as good as those of a silicon steel of similar carbon content, and it is claimed that the steel offers distinct advantages in its behavior during manufacture and working.

The amount of scrap produced is small, and in spite of the additional cost of the special elements the steel can be produced more economically and with more reliability than silicon structural steel. It is much easier to weld, and is more resistant to corrosion. Like other German steels, it has a lower tensile strength than the steels with a 45,000-lb. limit of proportionality used in England, but an increase of the carbon content with an adjustment of the copper and chromium contents might lead to the development of a steel of high quality possessing a high limit of proportionality and good ductility.

Hot Aqueous Solutions for Quenching

Advocated to Take Up Gap Between Extremes of Customary Coolants—Sources of Danger

HOT aqueous solutions for the quenching of steels was the subject of a discussion at the annual convention of the American Society for Steel Treating, during the National Metal Congress in Cleveland. A paper prepared by H. J. French, International Nickel Co., New York, and T. E. Hamill, United States Bureau of Standards, Washington, described experiments relating to the cooling properties of liquids used in the hardening of steel. Surface and center cooling currents were given for cylinders of 0.96 per cent carbon steel, ½ in. in diameter and 2 in. long. The effects of temperature of a coolant on the hardness and structure were shown, together with cooling times.

Graded Set of Cooling Characteristics Needed

The authors pointed out that present-day hardening practice is based on the use of oils, water and the more rapid-acting aqueous solutions, such as sodium chloride brines, sodium hydroxide solutions and water sprays at ordinary temperatures. There is a large gap between the cooling rates obtained with the customary quenching oils and with water, and this is now usually taken care of by tempering subsequent to hardening or by interrupted quenching. Such procedure, it was stated, is entirely satisfactory for many practical purposes, but simplification and economy and possibly also technical advantages would result if coolants were available to provide a more closely graded set of cooling characteristics.

The results obtained in these experiments, according to the authors, justify the view that some of the hot aqueous solutions can be useful in bridging the gap between the cooling rates obtained with water and oils at ordinary temperature, at least in the hardening of small pieces of steel, but some of the characteristics must be recognized as sources of danger.

The maintenance of rapid cooling at low temperatures may be undesirable in the hardening of some steels, but this also applies to drastic coolants, such as the cold brines and cold sodium hydroxide solutions now used industrially. Difficulties from this source can be minimized, in some cases at least, by removing the steel before it reaches coolant temperatures and under suitable control conditions any benefits derived need not be at the expense of high hardness.

Other Sources of Danger

Another source of danger in the hot aqueous solutions is lack of uniformity promoted by the formation of relatively large amounts of steam, but this becomes more marked as the bath temperature approaches the boiling point of water and can probably be counteracted through adequate circulation and adjustment of coolant composition and temperature.

F. R. Palmer, Carpenter Steel Co., in a written discussion of the paper, said that he felt the authors should step lightly in suggesting the possibility of substituting a properly regulated quenching speed by a full quench followed by a suitable draw. Quenching at best, he said, is subject to variables which at present are beyond the hardener's control. These variables are caused by the size and shape of the piece being quenched so that different parts and different areas must receive different quenching effects. This being the case, strains are bound to be present and anticipated structures will fail to materialize in certain unfavorable areas. In the present state of the art it would seem safer to subject the piece to a quenching speed sufficiently rapid to form a uniformly hard structure, even in the most inaccessible areas and then draw the parts back to secure the proper combination of hardness and toughness.

Sensitiveness of Quenching Bath's Temperature

It would also seem, he said, that the temperature of the quenching bath for the purposes described in the paper is more sensitive than furnace temperature when the steel is heated. That is, a difference of 10 deg. in the heating temperature probably would not affect the parts being hardened while, as the authors pointed out, this small variation makes quite a difference in the quenching effects of both brine and sodium hydroxide around 80 deg. C. For commercial service this would require accurate thermostatic control involving both heating and refrigerating facilities in the quenching bath. Mr. Palmer hoped the authors of the paper would continue their efforts to reduce quenching operations to understandable figures.

Increases the Life of a Die

In a verbal discussion, Mr. Palmer stated that a certain coining die was required that would stand a 200,000-lb. pressure but no satisfactory steel was available. Tool steel was used but lasted only for 3000 to 5000 operations. Then a quenching mixture was devised and dies made of the same steel properly quenched lasted for 50,000 operations.

The question of the permissible temperature range of a quenching medium is one of much practical importance and to which the authors have made a distinct contribution, said John L. Cox, Midvale Steel Co. There is no reason to doubt the superior cooling effect of a 5 per cent solution of sodium hydroxide over water at ordinary temperatures and he said that the authors had presented proof that the cooling rate as compared with water would be satisfactory at the higher temperature.

Practice of the Midvale Company

It has been the practice of the Midvale company to quench in warm water such steel as chrome-vanadium when it is desired to secure higher physical properties than could be produced by oil quenching and an unmachined surface made cold water quenching hazardous because of longitudinal cracking. To secure uniformity of surface hardness it was necessary to limit the water temperature to a maximum of about 55 deg. C. with a preferred temperature of about 45 deg. C. The authors' curve showing that a great increase in quenching temperature occurs with water between 40 and 60 deg. C. confirms practical experience, he said.

Mr. Cox concurred with the conclusions of the paper that water at a temperature above normal can be used for rates of cooling intermediate between water at its usual temperature and oil. He said that a wide range of permissible temperature is evidently available with accurate solutions if one is willing to go to the inconvenience that their use entails.

Foundry Accidents Reduced

Intelligent and Systematic Supervision by the Management Has Proved Effective in Preventing Unsafe Practices

ACCORDING to industrial accident statistics, between 85 and 90 per cent of personal injuries to workers result from unsafe practices rather than from unsafe conditions. It is natural to find, therefore, that industry is giving an increasing amount of attention to educational work, planned to instruct employees in safe practices and to stimulate their interest in accident prevention. Many organizations, however, realize that the safeguarding of machinery and the removal of physical hazards, in addition to being direct means of preventing a small percentage of accidents, are essential to convince the employees that the management is sincere in its educational program.

These facts were borne out in this study of foundry safety work in which it is indicated that considerable progress in accident prevention is being made by the industry. The majority of the 88 companies reported that their accident frequency or severity rates had improved during the past two years, in one case as greatly as 90 per cent. A summary of the reasons for the improvement is given below. It shows clearly the widespread use of educational methods. As classified and arranged, these reasons point out the most important activities which have been found of value in many types of industrial safety work and, therefore, may be useful in the development of a safety program.

1. *Executive Interest*
- *a.* Active interest of president.
- *b.* Interest and cooperation of management.
- *c.* Leadership of foundry superintendent.

2. *Supervisory Interest*
- *a.* Discussion and foremen's interest.
- *b.* Careful supervision.
- *c.* Foremen's safety committees.

3. *Safety Director*
- *a.* Work of safety engineer.

4. *Selection and Placement*
- *a.* Class of men and women employed.

5. *Employee Instruction*
- *a.* Instruction at time of treatment of injury.
- *b.* Instruction of new employees.

6. *Safety Committees*
- *a.* Safety committee meetings.
- *b.* Safety committee drive.
- *c.* Organization of safety committee.

7. *Competition*
- *a.* Well planned inter-departmental accident prevention contests.

8. *Advertising*
- *a.* Safety bulletins.

9. *Employee Meetings*
- *a.* Safety and welfare meetings.

10. *Safe Condition*
- *a.* Safe equipment.
- *b.* Improved equipment.
- *c.* Orderliness.
- *d.* Goggles, leggings and special shoes.
- *e.* Better light and guards.
- *f.* Improvement of shop conditions.

TO determine how the principles of effective accident prevention work are being applied in the foundry industry, the Safety Service of the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., New York, has made a study, presented herewith, which summarizes the experience of 88 representative companies operating foundries, located in 24 different States and employing approximately 560,000 persons. The report deals with educational methods utilized to stimulate the interest of supervisors and workers in the prevention of accidents. The second part of the report will be published in a later issue.

Head Official Should Support Safety Work

A REVIEW of accident prevention work in industry discloses the fact that the results obtained are dependent in a large part upon the amount of personal interest taken in the company's safety program and the degree of leadership given to it by the chief operating official. Unless he is thoroughly convinced of the value of accident prevention work and indicates by actions as well as words his determination that accidents in the plant shall stop, those under his authority seldom take the proper amount of interest in safety. It has not been found necessary for this official to give personal attention to the details or actual direction of safety activities, but rather to manifest his approval adequately and to see that some competent executive is given the responsibility for the supervision of the work, either on a full or part time basis. In many plants the chief operating official indicates his approval by attending meetings of supervisors and safety committees, making a few remarks concerning the progress of the safety campaign. Letters over his signature, addressed to employees and either mailed to them directly or posted on bulletin boards, are often used to indicate his attitude. Many executives make it a practice to speak to their supervisors frequently about their safety work, congratulating those who have had good records and discussing with those less fortunate the reasons for their poor records.

From a careful analysis of the underlying causes of industrial accidents, it is apparent that many unsafe practices are involved which could be overcome by intelligent and systematic supervision. In a large number of organizations the support and active effort of the supervisory force are considered second only in importance to the leadership given the safety movement by the chief operating official. Means for reaching the supervisors with the safety message and of encouraging their constant attention to the prevention of accidents is, therefore, looked upon as one of the most important steps in the safety program.

In many of them the foremen are impressed with the fact that the prevention of accidents is a definite function of supervision and an essential activity in all phases of the company's operations.

Foremen Responsible for Safety of Employees

Fifty-seven state that they are holding the foremen responsible for the safety of their employees. In 11

cases the accident costs are charged against the department in which the accident occurs or which is responsible for it. In some cases this is accomplished by including such costs in the departmental operating expenses; in others, by charging the costs against the foreman's profit-sharing fund. In the former instance, accident costs help to measure the foreman's efficiency; in the latter, they affect his income.

In addition to the personal contact between the supervisor and the chief executive, the majority of reporting organizations provide some regular method for reaching the foremen at definite intervals with the safety message. In some plants, safety committees are organized among the foremen. Others include safety on the program of all production meetings to indicate the relationship between accident prevention and production. At these meetings it is customary to discuss the outstanding accidents which have occurred since the last meeting, the relative standing of each department, the trend of the accident experience of the company as a whole and the outstanding causes of accidents. The policy of the company with regard to safety work and steps for the prevention of future accidents are also reviewed. Monthly meetings seem popular, but in several cases it was noted that they are held even more frequently. In fact, five foundries hold weekly meetings.

In a number of foundries, the foremen hold meetings of the employees of their respective departments. These are usually very short, held on company time, and are distinctively informal. They provide an opportunity for the department head to emphasize his personal interest in safety, review the personal injury record of the department and discuss with his men means for preventing the recurrence of accidents.

Safety Activities Should Be Headed by Director

THE desirability of having some representative of the company placed in charge of the safety work, either in a supervisory or consulting capacity, is emphasized by the fact that 62 of the 88 foundries reported this practice. The average number of employees in companies in which some one is designated to carry on safety work is 690. The smallest of these companies had 30 employees. Twelve of them considered that, on account of the size of the organization and the hazards involved, a full-time safety director was essential. These are the larger companies, although

four having full-time directors employ less than 500 men. Where the work is assigned to a full-time employee, titles of safety director, safety engineer, supervisor of safety or chairman of the safety committee are utilized; but when it is on a part-time basis, the safety work is carried on in conjunction with employment, industrial relations, personnel or welfare work.

In some organizations the superintendent of insurance also acts as a safety director, and in one or two instances responsibility for the work is assumed by the department superintendent or his assistant. In one large company, employing 6000 men, each plant superintendent is looked upon as a safety director in his particular unit and the safety work of these individuals is coordinated through the medical department.

The experience of many organizations conducting successful safety work indicates that best results are obtained when the responsibility for the prevention of accidents is placed upon the supervisors, the director of safety serving as a consultant to them and a correlator of the activities of the various departments. In such cases, the usual duties of the safety director consist of keeping the management informed of the progress of the safety work and the necessity for additional educational activities of physical safeguards, planning the company's safety activities and assisting the supervisors to stimulate the interest of the men under their authority in safe operating practices and carry out their part of the program. In most instances, he is held responsible for the compilation of accident statistics and the preparation of statistical reports for the use of executives and supervisors. In some cases, all plans for alterations, new construction and installations must be approved by the safety director, thus assuring that proper consideration has been given to safety features.

It has generally been found that an accurate knowledge of facts is as essential to the solution of the accident problem as it is to the correction of any other unsatisfactory operating condition in a plant. Simple and yet effective measures have been developed to obtain and tabulate information concerning personal injuries in a manner which will make it useful in the accident prevention work of the company. This information frequently forms the basis for the construction of the safety program by indicating those activities most essential, under particular conditions. It also provides the management with a measure of the need of safety work and of the results being obtained, and furnishes material of value in presenting the situation to supervisors, safety committees and employees.

Service Piping Welded in 40-Story Building

Practices Commonly Observed in Trunk and Distribution Mains and in Industrial Plants Extended to Architectural Field

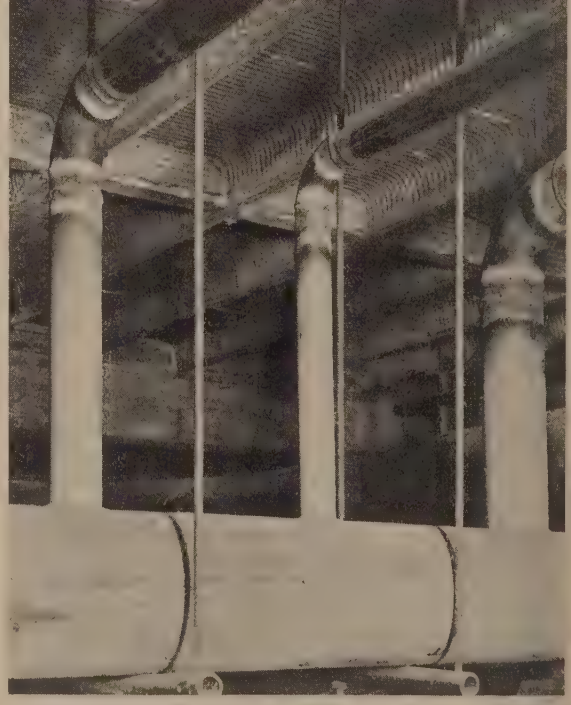
BY W. I. GASTON*

WELDED joints have been accepted as best practice for oil and gas distributing systems not only on account of reduced installation, but especially because of low maintenance costs and vanishing leakage. For some time oxwelded steam, air and other service piping has also been extensively employed in manufacturing plants. A notable recent extension of the same practice to a large office building is found in the new Carbide & Carbon Building in Chicago. Not only all steam piping above 2½ in. in diameter, but the fire protection lines and the automatic sprinkler system mains have been fabricated by oxy-acetylene welding.

Welding Saves Fittings and Insulation

The main steam header in the sub-basement was neatly and efficiently constructed by welding without the use of flanges or special fittings. This header has eight branches varying in diameter from 10 in. to 2 in. As shown in the illustration at the right it was made merely by cutting holes in the main steam pipe of correct size and shape, fitting into them a branch of smaller pipe, and welding the seam all around. All piping for auxiliary equipment in the boiler room is also welded; in several locations connections that would have been extremely difficult to make with flanged or screwed fittings were easily constructed. Trouble from gasket blowouts, leaky joints or split fittings in almost inaccessible places is avoided.

Considerable metal and insulating material were saved by the elimination of flanges and heavy cast fittings, and the pipe covering was correspondingly simplified. It has been the experience with welded steam piping in industrial plants that maintenance costs for insulation are reduced almost to zero when bolted and gasketed joints are eliminated, and a similar result is confidently expected for



Main Steam Header in Sub-Basement With Headers Welded in Place

*Technical publicity department, Linde Air Products Co., New York.

Workman Making Overhead Weld in Fixed Pipe

similar work in office buildings. No leakage occurs through a sound weld, whereas it is impossible to insure absolute tightness in mechanical pipe joints. A small leak will water-log and ruin an expensive mass of molded insulation in the vicinity, and cause a wholly disproportionate repair bill.

From the boiler room 8-in. and 10-in. lines turn upward into the pipe shaft. These risers are continuous and unbroken, to the thirteenth floor, where expansion joints are inserted. Above the expansion joints the lines make an easy swing to avoid structural members and then continue to the twenty-third floor. The view shows how these angles are made by sections cut on the job. At the twenty-third floor the larger riser bends, twists, and rises again to an attic space at the base of the tower. The pipe branches and circles the building, having take-offs at numerous locations for vertical returns to radiators in the rooms below.

This piping in the attic above the twenty-third floor is virtually the distributing system for all steam, the lower floors being heated by the return system from the 10-in. main (which rises untapped to this level), while the stories in the tower are heated by a direct system supplied by the 8-in. riser with take-offs at each floor above the twenty-third. Welded construction was especially handy in this cramped attic space, where heavy, cumbersome wrenches and pipe tongs could hardly be manipulated.

Fire Protection Lines Also Welded

A completely welded high pressure water system leads from the fire protection pumps in the sub-basement to every floor of the structure through one high-level and two low-level standpipes. In addition to these standpipes the mains and risers for the automatic sprinkler system in the basement and sub-basement are included in the fire protection equipment and are welded throughout. Such emergency piping must be joined in a most dependable manner. Sufficient experience has been had with welded joints, proving their reliability through intense conflagration, floods and earthquakes, that fire underwriters were willing to accept oxy-acetylene welding as an entirely satisfactory method of construction.

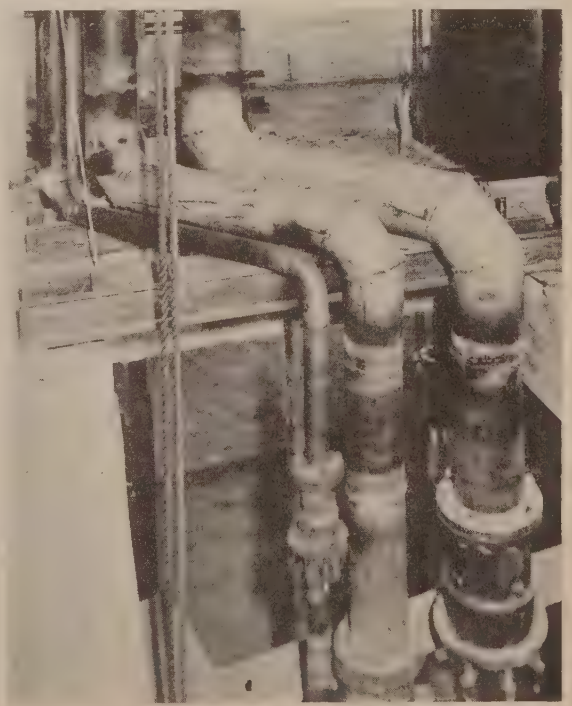
Tube Turns Replace Elbows or Miter Joints

One noteworthy feature is the extensive use of "tube turns" for elbows and bends. Tube turns are made by forming the pipe over a mandrel in such a way that the pipe wall is of uniform thickness at all points of the bend. An article describing the method of manufacturing such short radius bends was printed in THE IRON AGE, April 5, 1928, page 933. They are much more sightly and offer less resistance to fluid flow than the mitered 90 deg. elbow frequently made in the field by the welder with his cutting and welding blowpipes.

Regulating valves, supplied by the manufacturer with ends specially prepared for welding into the line instead of the customary flanged or threaded ends, constitute another innovation. Joints in the brass hot-water piping were welded by means of a recently developed bronze welding rod which produces extremely high strength joints with hardly any fuming.

When steam pressure was turned on for test not a leak appeared in the welded piping. The steamfitter foreman was much impressed by this demonstration and by the fact that it was possible to draw an unusually high vacuum in the system under operating conditions.

Devoted to the highway and the motor vehicle in Canada, a pamphlet of 34 pages issued by the Dominion Bureau of Statistics, Ottawa, Canada. The figures relate to 1928, at which time there were more than 1,000,000 automobiles. A great deal of information is given as to vehicles in the various provinces and subdivisions of provinces, production of automobiles in Canada, and such subsidiary items as accidents, registration fees and other particulars incident to the operation of cars.



Expansion Joints and Offset in Pipes at Thirteenth Floor

Intricate Castings from Automatic Dies

Alemite Company Pays Special Attention to Insets, Placing and Withdrawing Cores, and Gating and Venting Dies

BY J. B. NEALEY*

SOME 2000 dies comprise the active stock of the Alemite Die Casting & Mfg. Co., Chicago, from which a gross tonnage is made comparable to any other concern in America. Such a wide variety of work also involves a wide variety of alloys, capable of classification, however, into four groups with the principal metal either aluminum, zinc, tin or lead. The product is absorbed by a number of industries, of which the automotive stands first.

Operations on so large a scale permit an efficient handling of hot metal from alloying department to the casting machines. Alloys of specified analysis are made up from virgin metal (together with own scrap for remelt) in 15 gas furnaces built of firebrick inclosing oval or round pots. Each pot has a capacity of 3 tons and is heated with 10 gas burners. The pots are made from special acid-resisting and heat-resisting alloy castings developed by the research department of the Alemite company, and the molten metal is removed from these furnaces to the die casting machine in wheeled pots as needed. Any surplus is pigged and stored.

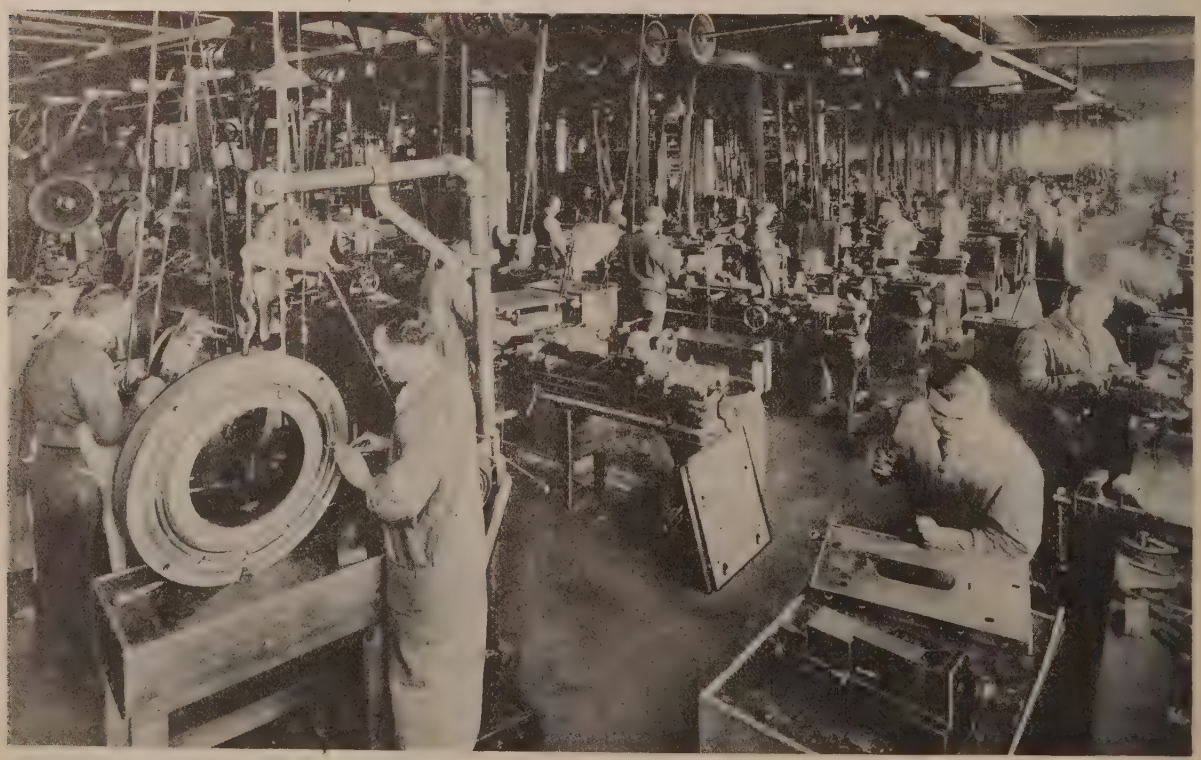
The view on page 969 shows a battery of 35 die casting machines in the Chicago plant. The hot metal is forced into the mold by compressed air in the customary manner.

*American Gas Association, New York.

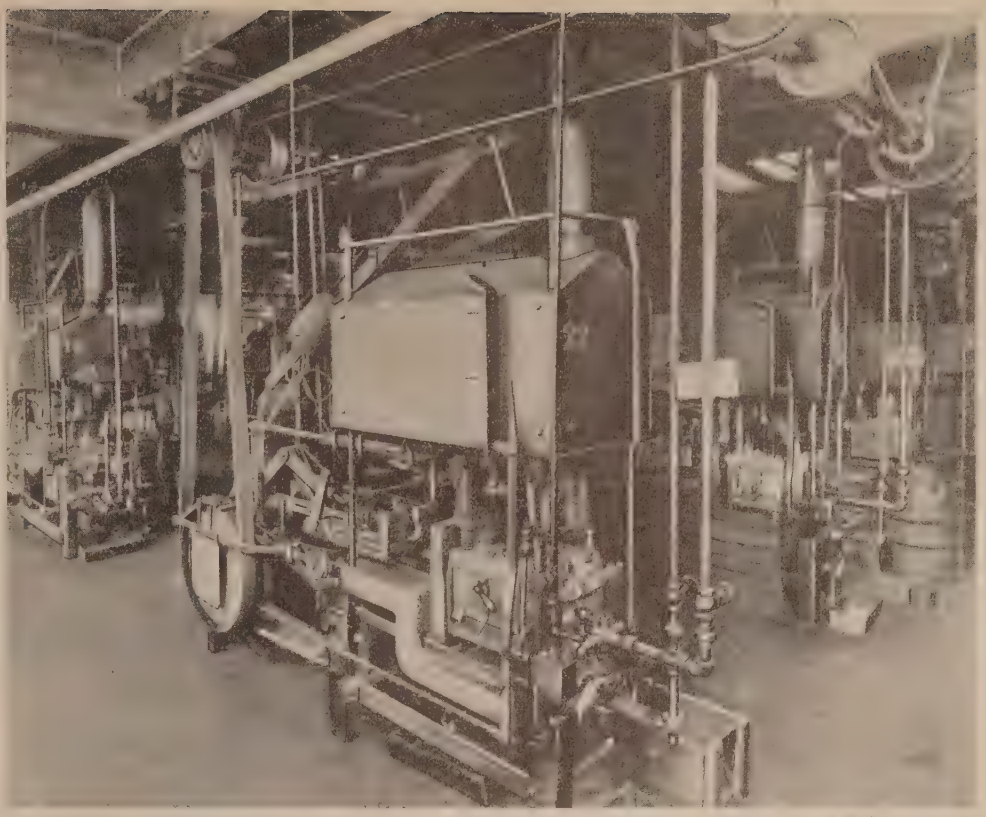
Each machine, however, was designed and built in the company's own tool room, especially for the service required. The gas-fired reservoir (made of steel) holds about 1500 lb. of molten metal; the die is shown in the open position. This machine is fully automatic; the operator merely presses a lever, the die is closed, the protective hood is dropped, the fluid metal is squirted into the mold, the hood rises, the die opens and the casting is ejected in a single cycle. Operating on medium sized work, a single machine will produce close to a ton of castings in a 9-hr. day.

Engineers for the Alemite company have devised many labor-saving arrangements for placing insets into the dies, and for placing and pulling cores. Occasionally as many as 25 cores and insets are used in a single casting; frequently fixtures for assembling them are very convenient. One casting made in quantity has a core which requires 20 tons' pull to remove, yet it is placed and pulled automatically.

Method of gating dies is of great importance because at a pressure on the molten metal of 600 lb. per sq. in. the time occupied in filling the cavity is measured in fractions of a second. It is therefore necessary so to design the gate that the metal will flow freely and with no restriction and the least possible friction. It is also essen-



Extensive Tool Room Required to Make Dies and Complete Machines for Castings of New Design



Battery of Thirty-Five Die Casting Machines, to Operate on Fully Automatic Cycle. Operator merely presses a lever, and the drive mechanism, by suitable cams and toggles, closes the die, drops the protective hood, fills the mold, pulls the cores, raises the hood, opens the die and ejects the casting

tial to vent the dies so the air can quickly escape but in such a manner that the metal cannot follow.

The latter essential is met by making very wide but very shallow air vents, which allow the air to escape at the proper speed but cause the metal to freeze upon entering, thereby preventing wastage of any metal, or the production of fins. A mold wash has also been developed which not only protects the die but improves the surface of the casting and modifies to a certain extent the speed at which the skin chills when the melted alloy strikes the face of the cool die.

This company's plant at Woodstock, Ill., has 150,000 sq. ft. of floor area, twice as large as the plant at Chicago. An interesting development at Woodstock is the introduction of machines for the manufacture of a full line of cast aluminum cooking utensils, already in production in a smaller way at the Chicago plant. A special alloy suitable for die casting, and containing no ingredients which can taint the food, has been developed by the research department.

In design, the metal body of these utensils is much thicker than similar articles now on the market, which, it is claimed, will afford the following advantages: retains heat longer, gives a more uniform distribution of heat, offers less chance of burning food, and gives longer life to the utensil. An added convenience is a handle made of material which is a nonconductor of heat.

These activities are illustrative of the manner in which large scale industry uses manufactured gas as a source of heat, primarily because of its adaptability, cleanliness, ease of control and economy. Gas is used to melt the alloys in the first place, and to keep the reservoir liquid at each machine. Practically all commercial varieties of plating, including chromium plating, are done in the finishing of die-cast hardware, and all requirements of heat in this department are supplied by gas. The dies themselves require accurate and complicated heat treatment, and this is done in gas-fired furnaces of most modern type.

Finds 42-Year Old Steel Skeleton of Building Unimpaired

The Robert W. Hunt Co., Chicago, has examined the metal from the dismantled Tacoma building, Chicago, erected in 1887. This 13-story building was among the first to use steel in such a way that the brick facing is supported by the skeleton. Columns in this building were of cast iron, round in section; beams were of steel (not wrought iron) of the following composition:

Carbon, 0.12 per cent; manganese, 0.40 per cent; phosphorus, 0.06 per cent; sulphur, 0.03 per cent.

Steel to cast iron connections were bolted; steel to steel were riveted by hand. Close examination showed that the framework of this building would have been good and efficient for many years to come. Original location markings in paint were as fresh and bright as when the beams were first covered. The material in the webs of the beams as originally rolled was less than ¼-in. thick, yet was still perfect and capable of carrying the loads when the sections were removed.

Steel Houses to Be Built in France

Because of the necessity of providing accommodations for those who have been expelled from the military zone around Paris, the authorities have under consideration, according to *Engineer*, London, a proposal to construct steel houses in the industrial suburb of La Courneuve. As an experiment about 50 houses will be built, and if satisfactory about 1500 houses of the same type will be constructed.

Diesel Plant Shows Marked Economy

Supplies Entire Power Needs, Including Welding Current, of Structural Fabricating Shop, for 1.2 Cents a Kilowatt-hour

BY EDGAR J. KATES*

THE increasing use of electric welders, cranes and other labor-saving machinery in structural iron works has caused a steady growth in their power requirements. In consequence, the cost of power in these shops is becoming a more and more important factor in production cost. When power needs were small, electric current purchased from a public utility was the natural choice, but mounting electric bills are now giving much concern to many works managers.

With a view to cutting power costs several managers after investigation have installed modern Diesel engine power plants. Such an installation was put in service in March, 1928, by the Vulcan Rail & Construction Co., at Maspeth, N. Y., manufacturer of structural and ornamental iron, such as railings for bridges and viaducts. This Diesel power plant is a good example of modern design, and as the records of its operation and costs have been carefully kept, they should be useful to others.

The power unit is a 240-hp. six-cylinder Diesel engine, direct connected to a 160-kw. generator. The electric power developed supplies the entire shop requirements including the usual equipment of punches, presses and cranes, and in addition three arc welders having a very irregular demand, which is taken care of by an automatic voltage regulator. A large amount of compressed air is required for serving the shop tools, which include a large air hammer, and the demand for air is quite irregular. The air requirements are taken care of by two automatically controlled air compressors installed in the engine room. One of these is driven by a synchronous motor for high efficiency and is in continuous operation under the control of an automatic unloader. The other is driven by an squirrel-cage motor and is run only when the maximum air supply is needed.

The power plant was designed to operate with a minimum amount of supervision, and to this end various automatic controls were installed to take care of the supply of lubricating oil, fuel oil and cooling water to the Diesel engine. This has made it possible to put the plant in charge of a toolmaker working in the adjacent toolroom, who needs to leave his bench only to start and stop the engine and to give it an occasional inspection. In ad-

DIESEL Engine Unit Supplies Power, including Welding Current, for Plant of Vulcan Rail & Construction Co., Maspeth, Long Island, N. Y.

CARNEGIE LIBRARY OF ATL

dition a laborer spends a few hours a week in keeping the engine room clean and in emptying the lubricating oil purifier.

This arrangement has cut the attendance cost down to $7.70 a week. In spite of the small amount of attendance, the engine has been kept in A-1 condition, and has given steady reliable service, not a single shutdown having occurred during working hours from the time the plant was started.

The operating cost of this power plant for the first seven months of 1929 is given in the accompanying table. This cost includes fuel oil, lubricating oil, attendance, cooling water, and a maintenance reserve, which was made quite liberal to take care of the future replacement of pistons, cylinders and bearings, when these parts wear out. Actually the cost of repairs and miscellaneous supplies up to now has averaged $7 a month.

The average load on the Diesel engine was only 37 per cent of its rating because an oversize engine was installed to allow for future expansion. Despite this low load factor, the power cost is only 1.2c. per kwhr. It is estimated that the engine can take care of 60 per cent greater average load than at present, and when this time comes the power cost will be even lower.

A saving which this power plant has effected but which is not shown in the table is in the price paid for fuel oil used for shop heating and forges. This oil was formerly bought in tank wagon loads at 8.5c. a gal. When the Diesel plant was installed, extra large oil storage tanks were put in, making it possible to buy the oil in carload lots. The same grade of oil was used as before, but the price was reduced to 6.05c. a gal., thus effecting a saving of $833 a year on the 34,000 gal. of oil used for factory heating and process work.

Operating Data and Generating Cost of 160-Kw. Diesel Power Plant for 7 Months Ended July 31, 1929

Operating Data	*Monthly Average*
Current generated, kwhr	12,761
Operation, hr	213.7
Average load, kw	59.8
Ratio average load to rated load, per cent	37.4
Fuel oil consumed, gal	1,350
Lubricating oil added, gal	15.7

Costs	*Average per Month*	*Average per Kwhr.*
Fuel oil (6.05c. per gal)	$80.30	0.63c.
Lubricating oil	9.47	0.07c.
Attendance	32.14	0.25c.
Cooling water	1.00	0.01c.
Maintenance reserve	30.00	0.24c.
Total generating cost	$153.41	1.20c.

Compared to the previous power cost when using purchased current, this installation has made a saving of $6,550 in its 17 months of operation, which is 27 per cent of the initial cost. Thus, even with no greater load than at present, the entire investment will be repaid in less than six years altogether. This attractive return, coupled with the complete reliability of service, has demonstrated the wisdom of providing Diesel engine power for this shop.

Use of Safe Dies Eliminates Many Power Press Accidents

SAFE dies are a necessary factor in punch press safety, because they create in the operator a positive thought of safety and stimulate in him a natural desire to be more thorough and exact in his operations about the press, stated R. A. Shaw, tool and die stamping division, Murray Corporation of America, Detroit, in an address at the meeting of the power press section of the National Safety Congress in Chicago last week. Safe dies also eliminate frequent accidents and remove the fear which has driven many efficient operators away. Mr. Shaw said, in part:

To be safe, a die must be built vertical to the horizontal, proper clearance, especially piercing and blanking dies. All large dies should have springs, air pressure or some mechanical method of loosening the work after forming, piercing or blanking. Too often operators are drawn into hazards because of the lack of these items.

Properly constructed dies should be used so that the guide pins are in at all times; if open, a spring should be connected in order to protect the open space. Moreover, the embossed sections containing the guide pins and bushings must be at least 1½ in. apart and more if possible.

When trimming dies are used, such as for auto doors and rear panels, approved cutters are added which cut the scrap into several pieces. Small sections are less hazardous to handle and are cheaper to transport to bailers or railroad cars. All heels and latches or the starting trigger should be so constructed that the operator cannot crush his finger. This is a part of die construction that is too often neglected.

The majority of accidents in connection with power presses occur when the metal parts are being placed or removed. Some authorities believe it advisable to add chutes, automatic arms or other practical devices to the die, thereby keeping the operator's hands from between the dies. Tweezers, pincers or rubber suction handles can be used to remove the work from the die.

Because the production of regular dies generally occupies his entire attention, the die manufacturing superintendent often neglects to carry out special ideas or certain safety requirements unless a formal request is made. Such a request should be accompanied by a detailed explanation for creating a safe die and by an increase in the budget to take care of the added expense. This duty should be assigned to one person, who must closely check its performance, for it is only in this way that a safe die program can be established. This system has been successfully put into effect at the Simmons Co., Kenosha, Wis., and the Ford Motor Co., Detroit. Many persons can design a die, but it requires an expert designer to construct plans for a safe die.

In the manufacture of dies many hazards exist. Approximately 80 per cent of all 4-in. to 6-in. grinding wheels operating at a regular speed are not equipped with guards. There also is an absence of shields between workmen to prevent grinding sparks and dust from injuring them. Eyerings should not be used to hold up or move the larger sections of dies. A forged specially-shaped hook retained by bolts is much more reliable and safe.

Methods now employed in spotting in a die lead to many hazards which sometimes result in serious accidents. In placing a die in a press, many operators lean between the upper and lower sections, thereby exposing themselves to the possibility of grave injuries.

Automatic feeding, automatic ejecting mechanism, transfer slides, hopper feeding attachments and a method of cleaning out dies to prevent the temptation of the operator wiping them out with his hands are safety factors which should be considered. Uses also should be developed for special combination dies, multiple or gang dies and compound dies in order to eliminate detail operations. Symbol numbers should be placed on the open outside of the die instead of on the upper face surface where the operator cannot see it unless he puts his head between the dies.

Machine Tool Exposition Shows Progress in All Lines

THE raising of the curtain on the second National Machine Tool Builders' Show, which opened at the Public Auditorium, Cleveland, Sept. 30, revealed an extensive aggregation of equipment that was a striking tribute to the machine tool industry. The number of new designs, some of them innovations, was large, while the use of tungsten-carbide cutting tools added considerably to the spectacle. Machines of all classes were in operation. High production, with close accuracy, even on machines performing cycles of complex operations, was to be noted on every hand.

With the dropping of the curtain, on the afternoon of Oct. 4, the showmen expressed satisfaction, for the attendance had been in excess of 20,000, a large amount of equipment had been sold, and many active contacts had been made with prospective buyers.

Sixty More Exhibits Than in 1927

With 245 exhibitors occupying 95,000 sq. ft. of floor space (150,000 sq. ft. gross), this show was some 40 per cent larger than that of two years ago. Furthermore, it included more new equipment, both in machines and shop accessories. Some of the 67 companies that were on the waiting list of the exposition committees but could not obtain space within the Auditorium, engaged space nearby.

Of the 245 exhibitors, 165 were machine tool builders. It is estimated that more than 900 machines, including electric and other portable tools, were shown; many of these were demonstrated in the production of automobile, airplane and other parts. The total value of the exhibits is put at more than $5,000,000.

The exposition was wired to supply 5000 hp., which is believed to be a record for an industrial exposition. Roomy booths and wide aisle space added to the comfort of visitors and exhibitors alike. The largest individual exhibit occupied 3000 sq. ft. floor space. Compact symmetrical design together with the painting of all machines the "machine tool gray" recently adopted as standard by the N. M. T. B. A. made the exposition as a whole, harmonious and pleasing to the eye. Exhibits required more than 400 cars for transportation to Cleveland; the total expense of putting on the show is said to have been in the neighborhood of $500,000.

As at the exposition of two years ago, the general public was not admitted, the attendance being confined largely to plant executives. Registration, including exhibitors and their staffs, was in excess of 20,000, or about 4000 a day, and, as many visitors remained more than one day, the attendance was heavy at all times. Every branch of the metalworking industry was represented.

Foreign visitors included a large delegation from the Soviet Union, and were far more numerous than at the previous exposition. Delegations from various technical schools also attended the show.

All classes of machine tools were to be seen. Of the large machines shown, the largest weighed 51 tons. Displays of small tools and gages were numerous; in small tools, a 0.005 in. diameter twist drill for watch and optical work was shown as a regular commercial product. Several manufacturers of anti-friction bearings had booths, and there were exhibits of gears, chain, belting and other transmission equipment. Electric motors, starters and controls were shown by several companies. Lubricating and cutting oils, coolant pumps, lubricating systems, oil clarifiers and extractors, metal cleaning compounds, and metal parts washers and dryers were exhibited.

Attractive displays of portable electric tools included high-frequency models, and high-speed air tools and flexible shaft equipment were shown. Forcing, straightening, punch and other presses were under power, as well as forging machines, riveters, punches and shears, bending and forming machines, slitters, marking devices, balancers, spring making machinery, welding equipment and woodworking machines. Pipe machinery was demonstrated by several companies, and materials handling equipment included industrial trucks, electric hoists and trolleys.

Tungsten-Carbide Tools Demonstrated

Tungsten-carbide tools were shown by the Carboloy Co., the Ludlum Steel Co., and Thomas Prosser & Son. The last mentioned demonstrated Widia tools on a 27-in. engine lathe. Camite tools were used on a new chucking machine of the Cleveland Automatic Machine Co. Twist drills, core drills, flat drills, and reamers tipped with tungsten-carbide, as well as lathe and boring tools, were displayed by various makers of small tools, and the exhibit of the Ludlum Steel Co. included tungsten-carbide lathe center inserts and taps. Engine lathes and turret lathes equipped with Carboloy and other tungsten carbide tools were used by more than 20 exhibitors of machine tools.

A tungsten carbide inserted tooth saw was a center of interest at the booth of the Henry Disston & Sons, Inc. A 16-in. 60-tooth blade was demonstrated in connection with an Espen-Lucas machine in the cutting of 3-in. diameter No. 1 yellow brass at a speed of approximately 9000 ft. per min. The machine was equipped with a 25-hp. motor and hydraulic feed, the feed being at the rate of about 3.3 in. per sec. These saw blades, made in a range of sizes, are intended for cutting ebony board, bakelite, magnesia composition board and other materials difficult to cut.

Other demonstrations of these tools

Three Year Intervals Advocated

THE holding of a machine tool show every three years and extending its length to ten days was recommended by the Associated Machine Tool Dealers after a survey conducted to obtain the sentiment of both its members and machine tool buyers. The survey was made at the request of the National Machine Tool Builders Association and the recommendation was adopted at a meeting of the dealers' association during the week.

Various arguments were presented by those favoring a longer exhibit. Some executives of plants that are large buyers of machine tools stated that their organizations were badly crippled during the Machine Tool Show because of the necessity of sending a large number of men to the show. If the show was of longer duration, they pointed out, a few men could go for two or three days and could be replaced by others and in that way the attendance of their representatives at the show could be handled much more satisfactorily.

Some of the exhibitors also expressed preference for a show of longer duration because their booths were so crowded much of the time that they could not give proper attention to all the interested visitors. The matter will be taken up by the machine tool builders at their meeting late this month, when the time of holding and length of the show may be decided.

included those of the Monarch Machine Tool Co. On a 27-in. model M lathe, a cast-iron piece 14½ in. in diameter was turned at the rate of 1180 ft. per min., with a feed of 0.134 in. S.A.E. 1045 steel was turned at the rate of 620 ft. per min., 0.006 in. feed, 1½ in. cut. A Niles 27-in. Timesaver lathe equipped with a Carboloy tool was cutting semi-steel castings at speeds ranging from 180 to 650 ft. per min., feed 1/16 to 1/32 in. and cut from ¾ to 1/32 in. The machine was driven by a 35-hp. motor. Carboloy tools were used on a Reed-Prentice 16-in. lathe at a speed of 1200 r.p.m. A Gisholt 2L 19-in. turret lathe with cross feeding turret was machining a 9-in. forged steel clutch housing at 275 ft. per min. with an average of 3/16 in. cut on multiple cuts, and an average feed of 0.021 in.

The Warner & Swasey Co., among other demonstrations, showed its new No. 5-A universal turret lathe boring, turning and facing a 28-in. semi-steel flywheel casting; the speed was 200 ft. per min., and the feed ⅛ in.

With a Monarch 27-in. lathe, having 30-hp. motor and ball-bearing tailstock center, Thomas Prosser & Son demonstrated Widia tools in cutting various materials. S.A.E. 1040 steel bars, as rolled, were machined at a speed of 306 ft. per min., 0.043 in. feed and 5/16 in. cut, and S.A.E. 3150 steel was turned at a speed of 350 ft. per min., 0.021-in. feed, ⅜ in. cut. KA 2 stainless steel, 18 per cent Cr and 8 per cent N, 200 Brinell, 60,000 lb. tensile strength, was turned at a speed of 100 ft. per min., feed of 0.021 and cut of 5/16 in. UMA 5 steel, 1 per cent chromium, 0.50 carbon, 320 Brinell, 130,000 lb. tensile strength, was machined as rolled at a speed of 150 ft. per min., feed of 0.0045 in. and cut of ⅝ in., the chips coming off red hot. Bronze, 88 per cent copper, 8 per cent tin and 4 per cent zinc, was machined at the rate of 1150 ft. per min., 0.145 in. feed and 5/16 in. cut. A cast iron bar with four slots was used in demonstrating interrupted or jump cuts; the speed was 1200 ft. per min., the feed 0.145 in. and the cut 5/16 in.

Some of the new machines exhibited were designed specifically to permit use of tungsten-carbide tools at the high speeds required to take advantage of the possibilities of that material. Other machines, however, are considered by their makers as suitable, with few changes, to the requirements of those tools. Generous use of anti-friction bearings, as well as heavy and rigid construction, seems to be common to all machines for this purpose.

Use of Hydraulic Mechanisms Increases Threefold

Another noteworthy development is the more extensive use of hydraulic mechanisms. In addition to broaching machines, drills, honing machines, grinders, saws and milling machines, straightening and other presses, a new automatic lathe, a turret lathe and a shaper-planer with hydraulic feeds were to be seen. Reckoning both gear pump mechanisms and the Oilgear device, there were more than three times as many hydraulically equipped machines as at the 1927 Show. About 60 machine tools were fitted with the Oilgear mechanism, as compared to 22 machines two years ago. Flexibility, simplicity, ease of control, long life, ample reserve power, and the protection afforded to the machines and the tools, especially in the case of drills, seems to underlie the growing application of the hydraulic mechanism. Hydraulic chucking and indexing were also to be seen.

As previously stated, this Exposition reflected substantial progress in high production facilities, with accuracy, in all types of equipment. Rapid and convenient operation, and automaticity, leaving little for the operator to do except load and unload the work, featured a number of tools. In the case of at least one automatic lathe, no operator was required at all, except to start and stop the machine when desired, which was done by means of push button. In many cases one operator can attend several machines. Compact, rigid construction, liberal use of anti-friction bearings thorough lubrication and coolant facilities, filtered oil, protected bearings, employment of balanced pulleys and driveshafts, and the use of better steels and other materials, are factors in this increased productivity.

Design that allows adapting machines for particular jobs, by means of special fixtures and by unit construction that permits removal and replacement of heads, feed and speed boxes, etc., to change the machine over to the production of a redesigned or a different piece, or for general work, seems also to be a tendency.

Smooth working of the exposition, from start to finish, was commented upon by exhibitors, credit being given to Roberts Everett, exposition manager, and his staff; E. F. Du Brul, general manager, N. M. T. B. A., and his staff, and the exposition committee of the machine tool builders association.

Some of the new machines data relating to which were not available for publication in our Sept. 19 and later issues, are briefly noted below. More extended descriptions will be included in forthcoming issues of THE IRON AGE.

Brief Notes on Equipment Not Announced Before the Show

IN addition to a new model GA 2⅝-in. Gridley four-spindle automatic bar machine having four independent cross-slides the National Acme Co., Cleveland, introduced a Gridley automatic 4-in. model H, four-spindle chucker for rapid roughing and accurate finishing operations. Features include an improved hardened and ground square face turret, new steel cross-slides and anti-friction bearing spindles. The maximum chucking capacity is 4 in., the maximum swing 6 in., and the maximum turret feed is 6 in. The cross-slides have a movement of 2½ in. Spindle speeds up to 1200 r.p.m. are available. Pneumatic chucking is employed.

The same company also featured Namco opening dies with new circular chasers which are said to have more than ten times the ordinary chaser life. The chaser is a precision circular forming tool, its periphery being a series of lapped thread-form rings without lead. Lead is obtained by mounting the chasers on hardened steel chaser blocks, the faces of which are ground to the exact helix angle. A new compact motor-driven centrifuge with 300-gal. per hour capacity was also shown. The machine is intended for clarification and separation of cutting and other oils.

The Pratt & Whitney Co., Hartford, demonstrated a new vertical six-station, five-operation automatic machine for high production and long runs. Flexibility is a feature, and when suitably tooled the machine will perform a large variety of operations, including milling, drilling, sawing, facing, threading, tapping, hollow milling, reaming, serrating, knurling and boring. The drive is by a 7½-hp. motor, controlled by push-button. Separate sets of charge gears permit separate control of spindle and table speeds. Vertical movement of the work during cutting is controlled by cams. The maximum work diameter swing is 8⅞ in. Cutter spindle speeds ranging from 150 to 1500 r.p.m. are obtainable. The floor space occupied is approximately 40 x 74 in., and the height, not including the motor, is approximately 81 in.

A vertical chucking machine with six tool heads and a traverse slide was introduced by the Columbia Machine Tool Co., Hamilton, Ohio. It is said to have been designed to use tungsten-carbide tools and to be adaptable to production work of wide range. It has single lever centralized control, automatic revolving turret, and independent feeds and speeds through pickoff gears. Timken bearings are used throughout.

The Cleveland Automatic Machine Co., Cleveland, exhibited a new 7-in. model M, five-spindle hydraulic chucking machine for first and second operation work. The machine is self-contained, and the chucking pressure is adjustable to suit the character of the work. Accessibility is a feature. The company also demonstrated a five-spindle bar machine for rapid production of small parts requiring a number and a variety of cut. Independent feed control is provided for each spindle.

The new No. 4 universal turret lathe built by the Gisholt Machine Co., Madison, Wis., was in operation. This machine has automatic chuck capacity for round stock up to 2 in., and 12 spindle speeds, from 28 to 751 r.p.m., are obtainable through sliding gears and clutch. The hardened alloy steel gears are mounted on spline shafts. Tapered roller bearings are used for the spindle and drive shafts. It is stated that the speed rating may be doubled without damage to bearings or clutches. The drive is by motor through Texrope belts.

The headstock drive pulley is balanced. Other features include a turret that is clamped and unclamped automatically to the slide, and the square turret mounted on the front of the bridge type cross slide which is indexed automatically.

The Potter & Johnston Machine Co., Pawtucket, R. I., brought out a platen turret type model of its 5-D Power-Flex automatic. Simplicity of tooling, ease of set up and flexibility are features emphasized.

Milling Machines

An outstanding exhibit of the Cincinnati Milling Machine Co. was the new No. 3 universal miller featuring new operating convenience, as described in THE IRON AGE of Oct. 3. A small plain Hydromatic milling machine, designated as the No. 3-24, was also introduced, as well as a No. 4-48 duplex Hydromatic with bridge-type fixed-height rail, standard vertical spindle carrier and standard horizontal spindle carriers. A No. 4-48 plain Hydromatic with variable height overhung rail was another example of the company's unit plan construction.

Centerless grinders, one with continuous hopper feed, automatic compensation for wheel wear and hydraulic wheel-truing device and another with continuous hopper feed and automatic in-feed attachments were exhibited by the Cincinnati Grinders, Inc. A No. 4 centerless grinder for work up to 9 in. in diameter was also demonstrated.

In addition to the bridge-type Mil-Waukee-Mil described in THE IRON AGE of Sept. 19, the Kearney & Trecker Corporation, Milwaukee, had in operation No. 2 vertical milling machine equipped with its new skip-stop rotary table. The machine was in operation milling around the ends of airplane engine articulator rods.

The Mil-O-Matic milling machine, a new product of the Oesterlein Machine Co., Cincinnati, was in operation. This is an automatic hydraulic-feed bed-type machine equipped with either plain reciprocating or automatic indexing table. As an indexing machine the table makes a half turn at the end of its return stroke, advances again to cut, feeds, returns and repeats. Single-spindle, duplex, vertical and multiple spindle models, with standard bed and table lengths are available.

A universal production rotary milling machine with Oilgear driven table, said to be the first commercial application of hydraulic table rotation to a machine of this type, was demonstrated by the Consolidated Machine Tool Corporation of America, Rochester, N. Y. Newton cold saw cutting-off machines with Oilgear feed, which eliminates feed shafts, gears, reversing clutches, etc., were also exhibited. The saw blade cuts in the upward direction so that the thrust of the saw carriage is directly down on the base. This feature, with the hydraulic feed, is said to markedly increase the productive possibilities of the machine.

Several New Gear Cutting Machines

A center of interest at the large exhibit of the Gleason Co., Rochester, N. Y., was a four-spindle hydraulically-operated machine for rough cutting in large quantities straight bevel gears similar to those used in automobile differential. Four blanks may be cut simultaneously. The work is mounted on four independent workheads arranged around the cutting tool, which is a 20.8 in. diameter disk milling cutter with inserted blades. Each head is fed into the cutter for cutting the tooth space, and after the last tooth has been cut, the work is pushed off the arbor and is replaced by a new blank. If the blank is not correctly placed in the arbor, the head will not return to the cutting position until the safety valve is opened by hand. A 3-in. spiral bevel and a 3-in. straight bevel generator, both new machines, were also in operation.

The Barber-Colman Co., Rockford, Ill., introduced a manufacturing hobbing machine, designated as the type B, for roughing and finishing spur gears, spline shafts and similar forms. It is claimed that the machine will operate at speeds and feeds beyond the capacity of present high-speed steel hobs. Features include simplified gearing and drives; liberal use of ball and roller bearings; worm and worm gear final drive to the hob; work-spindle drive outside of the bed; and work spindle mounted in a housing that is fast to the base, the work diameter being controlled by an elevating bed.

A manufacturing type gear hobber for roughing and finishing large diameter and medium pitch spur gears, limited angle helical gears, sprockets and worm wheel was among the new machines of Gould & Eberhardt, Newark, N. J. Rated at 2 D. P. in steel, these machines, designated as the No. 48 HS and the 48 HL, have capacity up to 32 in. diameter with arbor support, and 57 in. diameter with the support removed.

Shaper-Planer with Hydraulic Feeds

Hydraulically actuated table and feeds is a feature of the new shaper-planer introduced by the Rockford Machine Tool Co., Rockford, Ill. Table speeds up to 75 ft. per min. are instantly available, and the ratio of cutting to return speed is 1 to 3. Hydraulic power for feeds is provided by a separate pump. A grinding head may be mounted on the cross-rail for surface grinding operations. Sturdy construction and simplified design are features of the machine.

A continuous filing machine was a new feature at the booth of the Rockford Drilling Machine Co., Rockford, Ill. The files are carried on a continuous band and are jointed to permit traverse over the driving wheels. Any standard shape of file can be furnished. Two speeds are available, 60 ft. per min. for steel, and 120 ft. per min. for brass and other soft metals. The work table is arranged to permit filing at any angle up to 30 deg.

Coldcut sawing machines equipped with a hydraulic-air clamping unit were exhibited by the Higley Machine Co., South Norwalk, Conn. Rapid and easy clamping of the work, eliminating fatigue from hand clamping, are advantages claimed. Clamping pressure is adjustable up to 500 lb. An air pressure chamber at the top of the hydraulic cylinder serves to maintain pressure in case of failure of the hydraulic mechanism.

William Laidlaw, Inc., Belmont, N. Y., brought out a metal cutting band saw so arranged that two jobs may be handled simultaneously, one on each side of the machine. The drive is from a motor in the base.

A hydraulic power saw was featured by the Racine Tool & Machine Co., Racine, Wis. An "oilmotor" reciprocates the saw frame, feeds the blade into the work and lifts the blade on the non-cutting stroke. Constant, controlled rate of speed, wide range of cutting speeds, adjustable stroke and simplicity of construction are claimed for the machine.

The Armstrong-Blum Mfg. Co., Chicago, had in operation its new Marvel hacksaw, with and without automatic bar feed. The feed is a combination of positive and friction feed; four-speed transmission is used. The capacity is for 6 x 6 in. material.

High-production threading of bolts, studs and rods was demonstrated by the Economy Engineering Co., Willoughby, Ohio, on its new four-spindle semi-automatic bolt threader. The machine is for work ranging from ¼ to ¾ in. in diameter, 6 in. and more in length. The only duty of the operator is to load and remove the work.

A center of interest at the booth of the General Electric Co. was the new hydraulic operator for controlling brakes, clutches, spot welders, etc. It is intended to take the place of large a.c. and d.c. magnets and solenoids, and to be used in place of air cylinders where smooth upward thrust is desired through a given distance. It consists of a motor-driven centrifugal oil pump, the impeller of which is mounted in a piston and driven by means of a spline shaft.

An automatic grease lubricating system that is controlled by an electric clock was something of an innovation. This system, called the Pneuma-Lectric, was shown by the Keystone Lubricating Co., Philadelphia. The feed control employed permits automatic lubrication of bearings at intervals ranging from 5 min. to 24 hr. The system combines the company's pneumatic safety lubricator served by a motor compressor unit with automatic switch, and a new rotary distributor that is operated by motor through a speed reducer. The system may be applied to one or a line of machines.

Other new developments in machine tools and accessory equipment presented for the first time at the Show will be described in forthcoming issues.

Visitors from Abroad to the Machine Tool Show

VISITORS from abroad to the Machine Tool Show were numerous. A third of them hailed from Germany. Some represented machine tool builders of that country but the world-famous A. E. G., (the General Electric Co. of Germany) automobile builders and firms from such centers as Solingen had their emissaries.

England sent the next largest delegation, amounting probably to 20 per cent of the total. The industries of these participants seemed notably diversified. About half as many came from France as from England.

Of 90 who registered in the early part of the week, 29 were German, 18 English and 10 French. Five each were credited to The Netherlands and Soviet Russia, the latter interested mostly in the automobile business. There were four each from Switzerland, Italy and Belgium, and three each from Sweden and Australia. Spain sent two and Poland, China and Czechoslovakia were each represented by one. In all, this list of 90 covers 14 countries outside of the United States and Canada.

Steel Companies Win Safety Awards

National Congress in Chicago Sets New Records With Attendance of 7000 and Increase in Exhibits

IN registration by visitors and space occupied by exhibitors, new records were set at the eighteenth annual safety congress, held by the National Safety Council, Sept. 30 to Oct. 4 at the Hotel Stevens, Chicago Registration, which totaled 7000, exceeded that of the previous year by more than 12 per cent. Exhibitors numbered 125, an increase of almost 50 per cent over the 1928 figure.

Outstanding among events at this congress was the display, for the first time, of talking motion pictures prepared especially to further the cause of safety. Also worthy of note was the increased interest shown at the meetings of the industrial health and nursing divisions.

One Company Has Perfect Record

Only one unit, of 34 entered, completed the iron and steel industry annual safety contest with a perfect record. The company which attained this distinction is the Haynes Stellite Co., Kokomo, Ind. At this company's Kokomo plant are employed 239 workers, who completed 325,890 man hours without a lost time accident.

The 34 units were divided into groups A and B. In group A, the Midvale Co., Nicetown, Pa., was awarded a trophy because of its record of 2011 employed, 2,848,371 man hours of service, four lost time accidents, which give a frequency rate of 1.404. The Corrigan-McKinney Steel Co., Cleveland, and the American Rolling Mill Co., Columbus and Zanesville, Ohio, with frequency rates of 2.606 and 3.837 respectively, received certificates of merit.

A trophy was presented to the Haynes Stellite Co., which led group B with a frequency rate of zero. The American Rolling Mill Co., Middletown, Ohio, and the Driver-Harris Co., Harrison, N. J., with frequency rates of 6.889 and 7.515 respectively, were recipients of certificates in this group.

Summary of data compiled during the contest reveals that the 34 units employed 58,800 persons, who worked 87,085,498 man hours for an average of 1481 hr. per person. Accidents reported numbered 1290 and the average frequency rate was 14.813. Nineteen units had a frequency rate below the average. The ratio of persons employed to lost time accidents was 46 to 1.

Officers Elected

Officers elected are: President, C. E. Pettibone, American Mutual Liability Insurance Co., Boston; vice-president industrial safety, C. L. Close, United States Steel Corporation, New York; vice-president public relations, C. E. Hill, New York Central Lines, New York; vice-president public safety, Miller McClintock, Harvard University, Cambridge, Mass.; vice-president territorial councils, George Opp, Detroit Edison Co., Detroit; vice-president finance, C. W. Bergquist, Western Electric Co., Chicago; vice-president engineering, Earl F. Blank, Jones & Laughlin Steel Corporation, Pittsburgh; vice-president membership, G. T. Hellmuth, Chicago, North Shore & Milwaukee Railroad Co.; vice-president education, A. W. Whitney, National Bureau of Casualty & Surety Underwriters, New York; vice-president health, Dr. C. E.-A. Winslow, Yale University, New Haven, Conn.; treasurer, J. I. Banash, Fonda Tolsted Co., Chicago; managing director, W. H. Cameron, National Safety Council, Chicago.

New directors are: H. B. Flowers, president, New Orleans Safety Council, New Orleans; T. W. Bachus, vice-president and general manager, Hercules Powder Co., Wilmington, Del., and Paxton Mendelssohn, philanthropist, Detroit.

National Safety Council executive committee for coming year is composed of: J. I. Banash, consulting engineer, Chicago; C. W. Bergquist, Western Electric Co., Chicago; Earl F. Blank, Jones & Laughlin Steel Corporation, Pittsburgh; C. L. Close, United States Steel Corporation, New York; F. A. Davidson, Patent Scaffolding Co., New York; W. F. Dougherty, General Motors Corporation, Detroit; H. B. Flowers, New Orleans Public Service Corporation, New Orleans; William C. Dickerman, American Locomotive Co., New York; D. T. Harrington, United States Bureau of Mines, Washington; G. T. Hellmuth, Chicago, North Shore & Milwaukee Railroad Co., Chicago; C. E. Hill, New York Central Lines, New York; Miller McClintock, Harvard University, Cambridge, Mass.; J. E. Long, Delaware & Hudson Co., Albany, N. Y.; R. B. Morley, Ontario Safety League, Toronto; George Opp, Detroit Edison Co., Detroit; C. E. Pettibone, American Mutual Liability Insurance Co., Boston; R. B. Stoeckel, commissioner of motor vehicles, Hartford; J. P. Sutton, Ohio Oil Co., Findlay, Ohio; A. W. Whitney, National Bureau of Casualty & Surety Underwriters, New York; Dr. C. E.-A. Winslow, Yale University, New Haven, and W. H. Cameron, National Safety Council, Chicago.

C. E. PETTIBONE, vice-president and manager of the engineering department of the American Mutual Liability Insurance Co., Boston, who was elected president of the National Safety Council, was born at Syracuse, N. Y., Jan. 19, 1884. He was graduated from the University of Toledo in 1903 and in 1908 received a civil engineering degree from Case School of Applied Science. For several years after graduation he was employed in engineering work for the Wheeling & Lake Erie and the Lake Shore Railroads. In 1910 he was made district safety inspector at Cleveland for the American Steel & Wire Co. and in 1911, he was engaged by Pickands, Mather & Co., to organize and direct safety and welfare activities. In July, 1920, he became manager of the engineering department of the American Mutual Liability Insurance Co. and a year later he was made vice-president.

A first aid team composed of Armco women from the Nellis, W. Va., mines of the American Rolling Mill Co., won the girls' State championship of West Virginia on Sept. 7 by making 796 of a possible 800 points. Competing against the six men's teams of their own plant on Aug. 3, the girls tied for third place with 296 out of a total of 300 points.

Sale of the Metal Aircraft Corporation of Cincinnati to Robert H. Shryver, Columbus, Ohio, was ratified at a special meeting of stockholders. The company will continue operations in the construction and sale of the Flamingo all-metal airship at its Cincinnati plant. Mr. Shryver is a retired banker of Columbus.

For Fiftieth Anniversary of the A.S.M.E.

Program of Mechanical Engineers' Meeting, in April, 1930, Will Be International in Scope

IN April, 1930, many of the world's outstanding engineers will meet in New York, Hoboken and Washington to celebrate the fiftieth anniversary of the founding of the American Society of Mechanical Engineers. The exercises will be non-technical in nature and will stress the humanistic side of engineering. They will be preeminently an exchange of greetings between nations through the medium of a series of papers presented by a prominent engineer from each of sixteen countries or geographical divisions of the world. These papers will develop the theme of what engineering has done for each author's country in a national sense and also for the advancement of world culture and civilization. These engineers will also endeavor to forecast the lines along which engineering may be expected to develop in the future, and to inform the convocation of some of the great engineering problems confronting their respective nations.

The main sessions, in which each of sixteen of the world's distinguished engineers will present a summary of his paper, will be held in Washington on April 7 and 8. Washington has been selected to accord with the national and international character of the celebration. Honorary memberships will be awarded to individuals who have rendered conspicuous service to the society, and medals of distinction will be conferred.

The president of the society will present a paper which will be the national report for the United States and will outline the future possibilities of service of the society. At this time also an eminent scientist will review the past contributions of science to engineering, the relation of engineering to science, and the influence of science on the future of engineering. In addition, a prominent American will present, from an international viewpoint, an evaluation of the influence of engineering invention, development, and accomplishments upon the cultural, social, economic, and political progress of mankind, and an outline of the future of engineering in solving the problems of mankind.

Other gatherings of interest include the reception at the White House for delegates and members of the society and their guests.

New Constitution Adopted by Engineers' Association

The American Association of Engineers has outgrown its original constitution and by-laws and has adopted a new one, which went into effect Oct. 1. The number of membership classifications is increased and the qualifications are raised. One of the new requirements for membership is that an applicant must, if his State has a registration law, be a registered engineer before his application will be approved. The association was formed in 1915. Its aim, according to its corporate seal, is to "Advance—Cooperate." It seeks to unite with all engineers and their organizations for the attainment of these desirable ends:

> (1) To standardize, extend and enforce registration laws; (2) To develop a definite and enforceable code of professional practice; (3) To increase professional unity toward achieving the same solidarity among engineers as that of doctors and lawyers; (4) To better engineering by raising professional standards, eliminating fake technical schools, and restricting the professional title to qualified engineers; (5) To encourage engineer participation in public affairs; (6) To combat unionism and the resultant lowering of the profession to a trade, and (7) To attain general recognition and higher economic standards.

The association states that its efforts have led to the adoption of registration laws in over half of the States, the placing of thousands of engineers in better positions, the offering of reasonable and reliable insurance, the study of earnings and adoption of salary schedules, the publication of a code of ethics and the championing of professional improvement, public recognition and civic activity.

Make Awards for Industrial Advertising

The National Industrial Advertisers Association held its ninth annual convention, together with an exhibition of examples of advertising and advertising campaigns, at the Hotel Gibson, Cincinnati, Sept. 30 and Oct. 1 and 2. Some 13 awards in all were made to exhibitors, including the following:

Jenkins Brothers Co., New York, for the best exhibit of industrial advertising.

American Rolling Mill Co., for the best exhibit of industrial advertising campaign in publications.

Joseph T. Ryerson & Sons, Inc., for an industrial direct-mail advertising campaign.

Oxweld Acetylene Co., for the best advertisement in a business paper.

A. Leschen & Sons Rope Co. for the best use of color in industrial advertising.

Hyatt Roller Bearing Co., for the best series of not less than six pieces of industrial advertising featuring news.

Cincinnati Milling Machine Co., for the best series of not less than six advertisements featuring performance.

Sivyer Steel Casting Co., for the most effective use of arrangement and typography in industrial advertising.

Officers Elected

Officers were elected as follows:

President, George H. Corey, Cleveland Twist Drill Co., Cleveland; first vice-president, Allan Brown, Bakelite Corporation, New York; second vice-president, Forrest U. Webster, Cutler-Hammer Mfg. Co., Milwaukee; third vice-president, E. L. Becker, H. W. Roos Co., Cincinnati; secretary-treasurer, Ernest H. Smith.

Blast Furnace and Coke Oven Meeting

The autumn meeting of the Eastern States Blast Furnace and Coke Oven Association will be held at the Cleveland Country Club, Cleveland, Oct. 11. The blast furnace men will hold a round-table at 10 a. m. under the chairmanship of A. E. Maccoun. The coke oven men will hold a round-table at the same time under the chairmanship of Emil F. Vogel. C. L. Wyman is chairman of the committee on arrangements.

At the blast furnace round-table four subjects are announced for discussion. These include bell and stock-line diameters and their relation to blast furnace practice; latest developments in gas cleaning; latest designs in hot-blast stoves; cooling plates above the mantle.

Coke oven subjects also number four, as follows: Electric tar precipitation; possibilities of improvement in coke sizing; preparation of the coal charge; quality, preparation and marketing of domestic coke.

Open-Hearth Men to Meet

Continuing the semi-annual program of the open-hearth committee of the American Institute of Mining and Metallurgical Engineers, the autumn meeting of the committee is to be held in the Hotel Stevens, Chicago, Nov. 5 and 6. Leo F. Reinartz, American Rolling Mill Co., Middletown, Ohio, is chairman of the committee.

The Chicago branch of the institute is planning a joint dinner meeting with the members of the committee at the Chicago Engineers Club, Nov. 6. There is a possibility that the committee in a body may make a trip from Chicago to Alton, Ill., Nov. 7, to visit the Laclede Steel Co. and view the new furnace installed there in which control of combustion is said to be unusually complete.

Paasche Airbrush Co., Chicago, has removed its New York sales and service branch to larger quarters at 103 Lafayette Street. L. J. Dagon will continue as branch manager.

Urges Adherence to Published Prices

Concrete Reinforcing Steel Institute Discusses Methods for Making Bar Distribution More Profitable

"THE Federal Trade Commission, through approving the open publication and circulation of prices to the trade and in approving a single closed bid, has paved the way for the elimination of the Oriental method of individual barter and haphazard dickering in individual transactions." This statement by Arthur Fisher, of Chicago, at the semi-annual meeting of the Concrete Reinforcing Steel Institute, held last week at Wawasee, Ind., opened the discussion of methods by which conditions in the reinforcing steel industry might be radically improved.

Another speaker was Edward L. Ryerson, Jr., president, Joseph T. Ryerson & Son, Inc., who pleaded with the fabricators to "sell service" instead of indulging in cut-throat competition.

Harvey Wiley Corbett of New York, one of the foremost architects in the United States in the modernistic field, paused during his address on "The Meaning of Modernism" to remind his audience that the American Institute of Architects, by the adoption of and adherence to a fixed schedule of commissions, had placed the profession on a high ethical basis. "Steel fabricators should likewise adhere to published prices and sell service," he said.

Says Few Bar Distributers Have Shown Profits

C. Louis Meyer, president of the institute, reviewed present-day conditions in the industry in his semi-annual address. He said:

"Many millions of dollars are invested in the reinforcing steel industry through the members of this institute. It is logical and reasonable that adequate earnings should accrue from this investment and from an annual business which amounts to close to $50,000,000. Unfortunately, competition during recent years has been so keen that few companies have shown a profit and many of them have suffered serious losses. Is it not high time that we individually and collectively should determine that we must and will conduct our sales activities in such a manner as to provide satisfactory earnings? I like to refer to a phrase coined by our genial vice-president, O. W. Irwin—'Confidence, Courage, and Cooperation.' These factors applied to our sales problems will make better profits.

"Let us plan now that we will stop taking business for nothing. Let us have a profit in every sale.

"An ever increasing use of intermediate grade reinforcing steel should be very encouraging to the advocates of a single standard of new billet steel. Curves showing tonnages used this year indicate a marked upward trend for the intermediate grade and a definite downward trend for both the structural and hard grades.

"The Concrete Reinforcing Steel Institute should stand for a quality product and for superior service. The specification for intermediate grade billet steel is the specification of a quality product. We should encourage the building industry to accept this material as the best product which the steel industry can manufacture, as the best product for use in reinforced concrete. It should be known as the institute standard specification. High standards of shop practice, of fabrication of reinforcing steel—high standards of engineering practice, should be adopted by every member of this institute. With these high standards as to quality of steel and of superior service relating to fabrication and to engineering practice, the building industry will soon accept these standards as their definite requirements. Membership in this institute will then become a thing desired by every member of the industry. Architects and engineers will then specify the products and the service offered by institute members.

Cost Information Necessary in Getting Better Profits

"Accurate cost information pertaining to any business is absolutely essential to the success of that business. The cost data which has been developed through this institute relating to the fabrication of reinforcing steel has been exceedingly helpful, I am sure, in pointing the way to better profits. More recently cost information pertaining to engineering work has been enlightening. To those few members who still do not report fabricating and engineering costs, may I encourage the preparation of these reports. Do this for your own satisfaction, as well as for the good of the industry. Only through the keeping of continuous records of costs can you know positively and definitely how to intelligently operate your business. It is to be hoped that the future will permit us to develop a reporting system covering selling and overhead costs. These items are as much a part of your actual costs as the items of fabrication and engineering. To obtain a complete picture of the costs of the reinforcing steel business, it is necessary to cover all of the elements of cost. It is true that the feature of diversification of products of many of our members complicates to some extent the accurate keeping of costs as applied to each product. This can be accomplished, however, and I am personally very hopeful that the future may offer a complete standard cost keeping system, which may be acceptable to all members of this industry.

"Recent years have developed a new kind of competition, that of industry versus industry. Some industries are expending millions of dollars in the promotion of their products. Business today can no longer stand by and be contented with its position. It must either go forward or backward. Industries today are organized into trade associations, institutes, etc. Promotional work on a large scale and national advertising programs are conducted through these trade associations so that any particular industry may hold its own in the game of competition.

"Referring to our own industry, reinforced concrete has made very rapid strides in the past 20 years. Much of this progress, however, has been through the replacement of competitive building materials. Reinforced concrete is now used extensively for many types of building work, for bridges, for roads, for sewers, etc. Other industries have suffered to some extent because of the advancement and the extension of the use of reinforced concrete. These industries have organized and are putting up a fight to get back at least a portion of the business they have lost. New types of construction have been developed, and they likewise are bidding for the business in competition with reinforced concrete.

"If our industry is to progress in the future, as it has in the past, we, who make up the industry, must con-

President Meyer's Advice to Concrete Bar Trade

- Let us have a profit on every sale.
- Stand for a quality product and superior service.
- Continue industry's promotional work.
- Encourage closer relationship between mill and fabricator.
- Adhere to published prices on concrete bars.

tinue our promotional work. We must continue our efforts in market extension, we must overcome the resistance set up by competing industries. I sincerely hope the men of this industry will recognize their opportunity to expand their business, to extend the use of reinforcing steel. Reinforced concrete is the logical, practical, and economical material to use for many classes of building and construction work. Some progress has been made in the use of reinforced concrete for residence floors, but this field as yet has not been scratched. The tremendous volume of residential construction throughout the country should offer an inspiration to every man engaged in the reinforcing steel industry to promote the use of this construction in that field. Recent years have seen a tremendous increase in the use of concrete roads versus other types of paving. While the use of reinforcement for concrete pavements has increased very materially, many roads and pavements are still being built without the use of adequate reinforcement. An aggressive, intelligent campaign promoting the use of reinforcement for concrete roads and pavements will produce very definite results in the way of increased tonnage. Bridges, culverts, sewers, etc., are all logical structures for the use of reinforced concrete. Real promotional effort, however, must be applied to develop these fields to the maximum.

"In looking to the future, I think the most important problem before the industry is the establishment of the logical and proper relationship between the mill and the fabricator. Fortunately, most of the mills recognize the wisdom of a policy which establishes them as the manufacturer or wholesaler, and the fabricator as the distributer or retailer—they realize it is not a healthy condition for the manufacturer to be a competitor of the fabricator. There are, however, certain mills which have as yet not accepted this policy. Their policy has been one of straddling the fence, of attempting to do business with the fabricator and to compete with him at the same time — of being both wholesaler and retailer. To a large degree, it has been the fabricator or the so-called bar company, which in years past has done the missionary and educational work incident to the promotion of reinforced concrete work. It has only been in recent years that some mills have attempted to do business directly with the trade, thereby competing directly with the fabricators. A closer relationship between the mill and the fabricator in the future should improve this situation.

"The fabricator with warehouses and engineering organizations established in most of the leading cities of the country is a very essential factor in the plan of distributing reinforcing steel. To develop the greatest possible tonnage of reinforcing bars, is it not logical that there should be complete understanding and cooperation between the mill and the fabricator? The mill should encourage the fabricator to distribute more and more of its products, rather than to discourage him by competing with him."

Trade Practice Rules

At the Wednesday morning session the institute members listened to a very forceful address under the subject "The Road to Real Profits" presented by Arthur Fisher of Chicago, a member of the firm of Butler Lamb Foster & Pope, legal counsel for the institute.

Mr. Fisher stressed particularly the trade practice conference rules approved by the Federal Trade Commission following the trade practice conference held by the industry at Asheville last April. Mr. Fisher said:

"Under precedents established by trade practice conference rules approved by the Federal Trade Commission in recent months in the case of four important American industries, this association of reinforcing steel fabricators and distributors may, in my opinion, now safely require the publication of prices by each of its members. Industries in which rules with reference to the publication of prices have recently been promulgated by the commission include not only the reinforcing steel industry itself, but also such other groups as petroleum refining and distributing of scrap iron and steel.

"Your industry may also now take the position that any departure from published prices until after those prices have been publicly withdrawn and new prices published and circulated is an unfair and improper trade practice.

"While this trade practice is not to be construed in any sense as justifying any agreements between competitors with reference to uniform prices, the natural effect of the open publication of prices is to stabilize a market on the basis of broader considerations of an economic character, rather than on the basis of individual barter and unrevealed and ill-considered dickering in individual transactions. The open publication and circulation of prices to the entire trade and the public is essential to give real value to cost studies such as those which have been widely encouraged and developed under the leadership of the Department of Commerce during the period of President Hoover's secretaryship. This is particularly true in a building industry where each job is in a sense unique.

" 'Firm bidding' has also now met the endorsement of the Federal Trade Commission and is another step toward the merchandising of reinforcing steel rather than the auctioneering of the product by the lowest bidder. If the industry will throw its weight back of the practice of permitting but a single closed bid, after due consideration of all relevant costs and other factors, on any one job by any one firm, the American method of selling will have replaced the Oriental in your industry. The commission has also given its stamp of endorsement to this procedure and its enforcement, at least in part on the ground that a practice which is a requirement of Government contracts is not improper in private business.

"In order to complete the structure of intelligent rather than haphazard merchandising, it is finally necessary to require, where several items of a different character are included in a single lump sum bid, that each item be quoted separately, and that the bid and the contract show on their faces the application of the published price to the unit price of the commodity. This requirement in all contracts for reinforcing steel has also met with Government endorsement as the approved practice of the reinforcing steel fabricating and distributing industry."

Award by Anonymous Donor

The members of the institute accepted the offer of an award, by an anonymous donor, for the most outstanding achievement related to the industry during the next six months. The award will consist of a plaque (appropriately designed and suitably engraved) to be presented in the name of the institute at the next annual meeting. It will be given as a mark of recognition for service rendered to the industry in research work or improvement of the product, service, merchandising methods or for market extension.

James F. Curley, vice-president, Concrete Steel Co., New York, read a paper on "Inspection of Reinforcing Steel." Charles M. Gunn, president, Gunn Carle & Co., San Francisco, presented a survey on the subject "Pacific Coast Market Conditions." Louis Aronstam, president, Southern G-F Co., Atlanta, Ga., presented a picture of future possibilities in the field of concrete joist construction.

President Meyer announced the appointment of J. P. Thompson, as assistant engineer for the institute, to take effect immediately. Mr. Thompson was formerly employed by the Portland Cement Association. The institute will place Mr. Thompson in offices to be opened in New York and his promotional activities will include the entire East coast.

On Tuesday afternoon the semi-annual golf tournament was played over the course of the Wawasee Country Club. At the banquet that evening William Turner of the Genfire Steel Co., Youngstown, on behalf of the institute, awarded prizes to the following: Low gross, D. C. Schonthal, West Virginia Rail Co., Huntington, W. Va.; low net, Don E. White, Hugh J. Baker & Co., Fort Wayne, Ind.; second low net, P. M. Louwerse, Truscon Steel Co., Chicago; consolidation, B. C. Thomsson, Concrete Engineering Co., Pittsburgh. W. C. Sensing of the Wilson-Weesner-Wilkinson Co., Nashville, Tenn., won a set of matched golf clubs in a blind bogey contest conducted by Peter Durant, professional of the club.

Data That Machine Tool Buyers Need

Five Fundamental Questions That Salesmen, to Serve Best, Should Be Prepared to Answer

INFORMATION that the machine tool buyer needs from the machine tool salesman was discussed in a paper by George T. Trundle, president of the Trundle Engineering Co., Cleveland, at the opening session of the Machine Tool Congress, at the Hotel Cleveland, Cleveland, Sept. 30. Because of Mr. Trundle's absence, his paper was presented by C. O. Malpas, vice-president of the Trundle company. P. E. Bliss, president of the Warner & Swasey Co., was chairman of the session, which was arranged by the machine shop practice division of the American Society of Mechanical Engineers.

"In the purchase of equipment," said Mr. Trundle, "the buyer first wants to know that the machine tool is made by a reliable firm, reliable financially as well as in ability to design and build.

"Secondly, he wants to know that the machine is not an infringement on someone else's patent. I consider it humanly impossible for any manufacturer to say that his product is free from infringement. Therefore, the manufacturer of this machine must be financially able to protect the buyer. The purchaser has additional security if he is buying the machine from a reliable agent.

"Thirdly, the buyer wants facts as to what can be expected from the machine in the way of production, based on facts furnished by him. Fourth, he wants to know what delivery he can expect.

"The third and fourth are the first two items which start the argument between the buyer and the seller. Seldom does a machine tool salesman get sufficient information from the buyer to state intelligently what production can be expected.

"The production from any machine of the best design depends on the type of holding fixtures, the type of tools and the kind of material the tools are made of, the heat treating of these tools, the ability of the buyer to properly sharpen the tools, the skill of the set-up man, the skill of the operator, and the kind of cutting compound.

"The salesman is often given a blueprint of the part to be machined. The blueprint will call for 1/32, 1/16, or 1/8-inch finish. It may be a forging; it may be a casting. The casting may be hard; it may be soft. It may be full of blow holes or hard spots. The same thing is true of the forging. It may not have sufficient stock for finish or it may have two or three times the amount specified on the blueprint. All of which has a direct bearing on the production that can be expected from the machine tool to be purchased.

"The conservative manufacturer will have his estimated production conservative. The reckless machine tool salesman will assume all conditions ideal and guarantee a much higher production. The buyer is after production. He will purchase the machine promising the greatest production, or a fight, whichever way you want to call it.

"In the latter case the salesman has not misquoted. He is basing his facts on a blueprint which specifies ideal conditions. The buyer should, whenever possible, let the machine tool salesman see the job for which he is buying the machine and should give him the history of producing that part to make it suitable to be used in an assembly that will become another machine.

Technical Data Wanted

"Fifth, the buyer wants to know the range of feeds and speeds. He wants to know whether his standard equipment, such as arbors, chucks, fixtures, etc., will fit the machine. He wants to know in considerable detail the size and design of the spindle, what kind of bearings, what kind of gears, whether the machine is motor driven, belt driven or combination. He is particularly interested in knowing whether sufficient power can be applied through the belt or chain to operate the machine at its capacity. One of the most important things he wants to know is: Is the machine properly lubricated?"

Depreciation Reserve Should Be Set Aside

Regarding depreciation reserve, Mr. Trundle said: "I have advocated for many years that a manufacturer set aside a reserve for depreciation of equipment to be used in replacing that piece of equipment when it has reached the end of its usefulness, or, better, when it has ceased to be a money earner. If something should happen to bring this about, the machine tool manufacturers would have to expand to produce enough machine tools to supply the demand, rather than having a few years of prosperity and a long period of no business, as has been the case in the past. The fact of the matter is that the average manufacturer is transferring his reserve from his machinery account to working capital and expansion, and using all of the profits to pay dividends. In other words, he is automatically spending the tangible assets of his business.

"One of the things the buyer wants from the machine tool salesman, but does not know it, is a continuous sermon on the subject of using his reserve for depreciation to keep the plant equipped with modern machine tools."

Iron Ore Imports Continue Heavy in August

August imports of iron ore at 298,013 gross tons showed a drop of only 1.1 per cent from the 301,418 tons of July. The August total was the third largest in more than six years, having been exceeded slightly also by that of August, 1927. Otherwise no month subsequent to July, 1923, has shown so heavy a tonnage.

Compared with last year the month records a gain of nearly 33 per cent. The excess of imports in the elapsed portion of the year, over last year, is now 390,000 tons, or 23 per cent.

As has been the case for many months, Chile supplied the major portion of the incoming tonnage, with about 57 per cent of the total. Chile's proportion in the eight months of this year has been nearly 53 per cent; last year it was about 56 per cent. Cuba is in second place this year, with Sweden third and French Africa fourth. Last year French Africa was in second place, with Cuba third.

Drills Spaced Holes in Structural Members

A MULTIPLE drilling machine for drilling rivet holes in structural steel has been brought out by the Thomas Spacing Machine Co., Pittsburgh. It is said to be the heaviest of its type on the market. It has a special roll-over table with spacing attachments, and will drill columns on both flanges and webs. It will handle any size or length of column, with or without cover plates.

Drilling equipment is mounted on extra-heavy cored column in which the counterweights are completely inclosed and on the face of which the drill-head moves. A variable-speed motor is mounted with vertical axis on top of the head, and travels with it, thus assuring a maximum of power transmission with a minimum of moving parts.

Directly between the motor and the spindles is an inclosed gear chest containing 98 heat-treated and ground Westinghouse - Nuttall gears. Each gear is supported on either side by a Hyatt roller bearing. An oil pump supplies oil under pressure over all the gears. The gear chest has been so designed that, 90 per cent of the time, there is practically no angle to the universal joints.

Oil-gear feed gives flexibility for different drilling speeds and provides a rapid traverse when approaching or withdrawing from the work. The maximum feeding pressure is high, and this, coupled with the high power delivered to the drill through the direct transmission, results in rapid drilling through almost any sort of material. Vertical screws between the end supports serve to back up the column during drilling.

The standard roll-over table furnished with the drill embodies the latest developments in spacing table engineering. Power driven in both directions, with a hand wheel furnished for fine adjustments, it is operated entirely through controls grouped in one place directly in front of the operator. Both the flanges and the web are drilled from one set-up, through the roll-over feature.

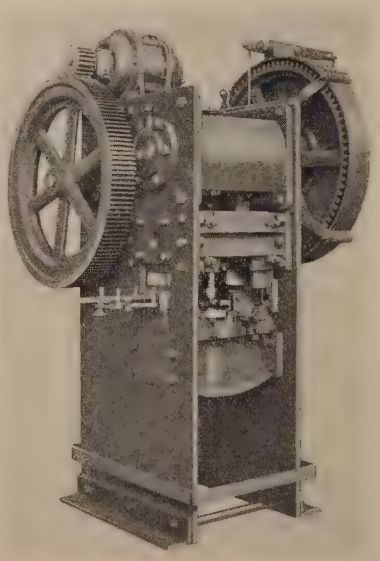
The spacing feature uses an indicator templet having three lines, one for each flange and one for the web. The cost of the templet is negligible, as it consists of a strip of wood with lines at proper intervals. The paper or drilling templet is a printed form, which is quickly marked to enable the operator to select the proper cluster of drills for each drilling. This marking is done in the templet shop, thus eliminating any of this work at the machine and letting the operator concern himself with operation only.

As illustrated, the machine is in use in the plant of the Mississippi Valley Structural Steel Co., Chicago. This unit is equipped with 24 spindles, which can be set in two or four rows.

Combination Machine with Steel Plate Frame

A COMBINATION punch, shear, trimmer and scarfer of double-crank guillotine construction, with a plate frame, is being manufactured by Hendley & Whittemore Co., Beloit, Wis. The frame consists of two rolled steel plates. The bearing housing is bolted between the frame plates. The eccentric shaft bearing castings are held by bolts which extend through the plate frames and the flanges of the bearing housing.

All gears are machine cut. The crosshead is held in guides provided with gibs adjustable in both directions. The die bed is a solid casting which extends through openings in the frame plates. The clutch, of the four-jaw dental type, has two keyways sliding over two splines embedded in the shaft, 90 deg. apart. End motion of the clutch is secured by a collar bearing against a shoulder on the clutch—the collar having three pins traveling in helical slots. All exposed working parts are guarded.

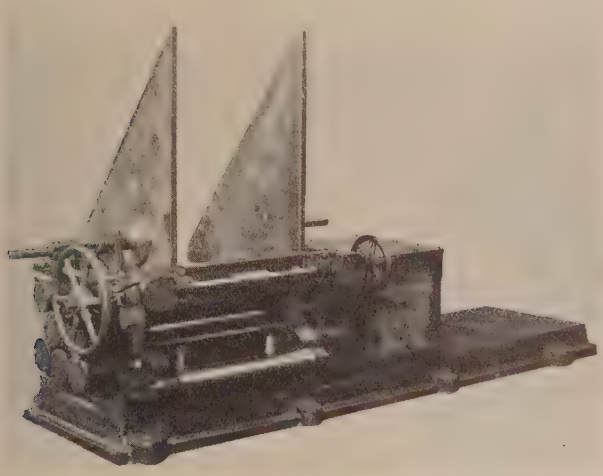


This machine is designed to shear, punch and diamond point 5-in. x ½-in. spring steel cold, and to scarf and nib 5-in. x ½-in. spring steel hot. General specifications are as follows: Floor space, 4 x 5 ft.; distance between frames, 20 in.; r.p.m. of flywheel, 275; strokes a minute, 38; standard stroke; 1⅛ in.; tight and loose pulleys, 20 x 5-in.; motor recommended, 7½ hp. at 1800 r.p.m.; approximate shipping weight, 5500 lb.

The American Chain Co., Inc., Bridgeport, Conn., and associate companies have moved their Chicago offices to room 1765 Chicago Daily News Building. The associate companies include the Ford Chain Block Co., Highland Iron & Steel Co., Manley Mfg. Co., Page Steel & Wire Co., Reading Steel Casting Co. and Wright Mfg. Co.

Machine to Open Coiled Strip Before Pickling

A NEW design of recoiler for opening heavy coils of cold-rolled strip before pickling has been brought out by the D. A. Clark Co., 1376 Fry Avenue, Cleveland. This machine has some new features provided, to give it large capacity and for handling wide strips and heavy gages at high speeds.



Three Options Obtain, in Methods of Opening Coils with This Machine, Depending on How Hard the Coils Are to Open

There are three optional methods for opening the strands. One is the retarding of the carrier rolls, to loop the material throughout the coil. This is regarded as sufficient for the average coil. An automatic feed to the bending roll is provided for opening the strands when harder stocks are being run. In addition, hand operation is available for quick adjustment, as needed.

The rolls are driven through spindles from the gear box, and all bearings are protected from scale. The gear unit has been designed to provide a smooth flow of power. This has been accomplished by a special arrangement of the gears which allows a straight-line drive to each roll, resulting, it is stated, in a marked saving of power.

One feature, which is optional, is a planetary safety clutch to protect the machine from overload. This, it is pointed out, assures more rapid production by protecting the recoiler against the shock of twisted coils, which are likely to damage the machine and necessitate a shutdown for repairs. The machines are sturdily built and are made in a complete range of sizes, either of the portable or stationary type.

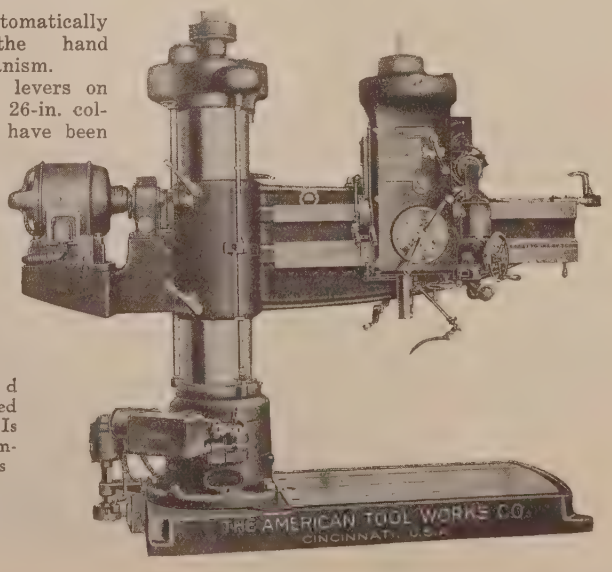
Improved Radial Drilling Machines

SEVERAL improvements, intended to facilitate operation, have been added recently to the radial drilling machines built by the American Tool Works Co., Cincinnati.

Electrical speed control operated from the head is outstanding. This mechanism is mounted on the right-hand side of the head and is within easy reach even when the arm is in its highest position. The control of speeds provided by a rheostat is through a star knob which operates the adjusting mechanism through a sprocket and chain. A graduated dial directly in back of the adjusting knob facilitates securing the desired speed.

An independent power traverse unit has been provided for rapidly moving the head along the arm. It is operated by a motor and switch on the right-hand side of the head and may be used when the machine is in operation or is idle. A small lever at the front operates the motor control switch and automatically disconnects the hand traverse mechanism.

Feed control levers on the 19, 22 and 26-in. column machines have been relocated, being placed at the extreme left-hand corner of the head. The entire range of 12 feeds is secured through the two levers, and the correct lever position for any desired feed is shown on the feed index plate. Unit control for clamping, unclamping, raising and lowering the arm is through a single lever located on the cuff of the column sleeve.

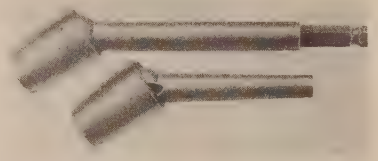


Electrical Speed Control Operated from the Head Is One of the Improved Features

Universal-Joint Nut Setters

FOR setting nuts and cap screws in inaccessible places, the Apex Machine Co., Dayton, Ohio, is offering the universal-joint tool illustrated. The socket end of the joint is made to fit over the nut, and the shank on the ball end is made to specifications as to shape, length and other dimensions. Advantages claimed include unusual strength at extreme angle, and the ability to set nuts tightly in one operation.

These tools are made of alloy steel and will operate at angles up to 30 deg. The illustration shows both the straight-shank style for welding to hand braces, and the special long-shank type with hexagon end for use in portable tools.



The Straight Shank Nut Setter Is for Welding to Hand Braces. The long-shank style has a hexagon end and may be used in portable tools

Hoffman & Scofield-Bruce & Cook Corporation, 66 Cliff Street, New York, jobber of sheet iron and galvanized and black hoops, has removed to 373 Pearl Street, where its business will be conducted under the name of Bruce & Cook, Inc.

Air-Operated Rivet Press

A WEDGE-TYPE rivet press exhibited at the Cleveland Machine Tool Show is made in two forms by the Hannifin Mfg. Co., Chicago. In one the gap is horizontal; in the other it is vertical; both types are illustrated.

No moving part except the ram is exposed. The five points requiring lubrication are provided with Alemite fittings. The operating cylinder is a double-acting air cylinder. Adjustment of the piston construction, to compensate for wear, is made from the outside.

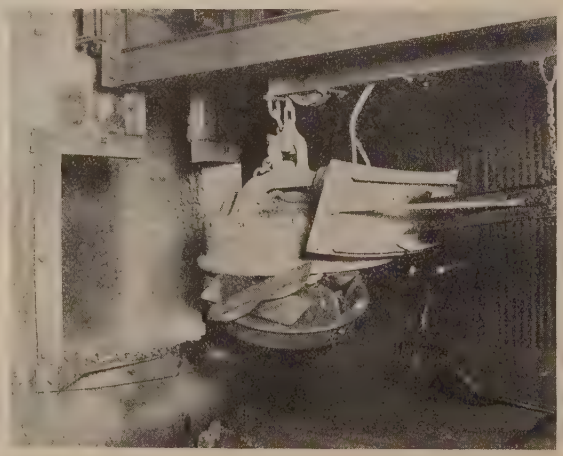
A wedge of predetermined angle is driven between two standard roller bearings mounted in the frame and a roller in the top of the ram. Forward movement of the air cylinder piston drives the wedge in and moves the ram down. The wedge has two angles, the first being comparatively steep to give rapid approach. This takes care of the first 2 in. of ram movement. For the final movement, which is 1 in. in stroke, there is a substantial decrease in the angle.

VERTICAL and Horizontal Forms of Wedge-Type Rivet Press

Although these presses are designed primarily for riveting they can be used for other squeezing operations. There are 13 sizes of the vertical type available, ranging from 5000 to 80,000 lb. pressure. Horizontal models over the same power range may be had in eight types.

Charging a Cupola with a Magnet

ASBESTOS insulation on the electro-magnet illustrated saves the magnet from damage from the heat of the cupola which it is charging. This is one of two 45-in. units used by the New York Car Wheel Co., Buffalo, continuously five days each week. The magnet was furnished by the Ohio Electric & Controller Co., Cleveland, to take the place of hand labor in charging the cupola.



SAVING Hand Labor by Using an Electro-Magnet to Charge a Cupola Involves Protecting the Magnet from the Heat of the Shaft

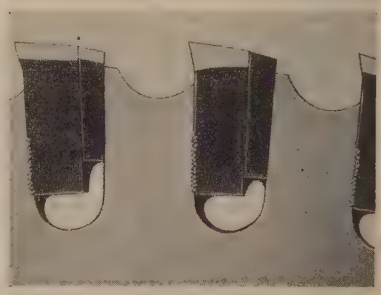
New Hacksaw Blades

A NEW line of hacksaw blades, for both hand and machine use, has been put on the market by the Simonds Saw & Steel Co., Fitchburg, Mass., under the trade name of Red Streak. The blades are said to be made of a highly wear-resisting heat-treated steel, and the teeth are of such shape that they will stand up under severe metal cutting operations, eliminating the difficulty of shelling when cutting hard metal. The blades are distinctively marked with a red back edge.

Inserted-Tooth Saw with Serrated Teeth

AN inserted-tooth saw, both the teeth and pockets of which are serrated, has been brought out by the Hunter Saw & Machine Co., Pittsburgh.

The serrations serve to lock the teeth firmly in the saw blade, eliminating the possibility of teeth moving while cutting. The teeth are adjustable by being moved up or down on the serrations; they are ground in the saw and need not be removed except for replacement, when worn out. A number of standard sizes are manufactured, and saw blades with thinner thickness of plate and kerf can be supplied.



The Serrations Lock the Teeth Firmly in the Saw Blade

To Discuss Heat Treatment of Springs

An address on the subject "Springs and Their Heat Treatment" will be delivered by R. W. Cook, vice-president the Wallace Barnes Co., Bristol, Conn., at the October meeting of the New York Chapter of the American Society for Steel Treating. The meeting will be held in the rooms of the Building Trades Employers' Association, 2 Park Avenue, New York, on Monday evening, Oct. 14. The lecture is scheduled for eight o'clock and will be preceded by a dinner at 6.30 in the dining-room of the association.

Railroads Protest Steel Rate Decision

Do Not Object to Uniform Scale But Object to Methods of Application by Commerce Commission

WASHINGTON, Oct. 8.—In their petition for reopening of the Eastern general steel rate case, carriers in Official Classification territory, in discussing the five points on which they based their plea, emphasized what they claimed were contradictory findings in the decision of the Interstate Commerce Commission as well as the losses in revenue which, they asserted, would arise from application of the decision.

The railroads protested against the level of scales prescribed as maximum reasonable rates throughout Official Classification territory; the port differentials; failure to prescribe the classification basis as the maximum reasonable basis for points within New England; the fixing of an arbitrary of 2c. per 100 lb. as the maximum to be added for interchange service between trunk and New England territories on traffic moving by way of New York harbor, and the alleged insufficiency of relief necessary under the long-and-short haul provision.

The estimate of the carriers that the scales prescribed would bring about a loss of $2,500,000 annually in revenues is the same as made by Commissioner Woodlock, who dissented in part from the decision. Other losses would result, according to the carriers, from the requirement that railroads compute mileage by way of the shortest possible route over which carload traffic can be moved without transfer of lading. In many cases, they stated, there are no actual open routes through which traffic can now move which are as short as those fixed by the formula for determining the rate. This, it was declared, would result not only in reduction of present mileages of the Central Freight Association lines, now computed on actual working distances, but in establishing a lower rate level based on a shorter distance than the shortest workable route between points.

As an example it was pointed out that, under the commission's formula, the rate-making mileage between Youngstown and Detroit is 230 miles, while the shortest workable distance and present class rate distance is 240 miles. The statement was made that the movement between Youngstown and Detroit is heavy and that the reduced rates resulting from the use of the commission's formula would necessarily entail a revenue loss not discernible by the application of the scale applicable to the entire territory excepting New England, which would take a scale 10 per cent higher than the basic scale. It was further declared that large additional losses in some territories would be suffered due to the fact that existing rates on billets, scrap iron and possibly other products, including pig iron, would in some cases be higher than the rates prescribed for manufactured articles.

The claim was set up that the carriers in Official Classification territory are not earning a fair return as contemplated by the statute and that the commission under the law cannot make a general reduction in rates on an important class of traffic such as manufactured iron and steel in such a way as to reduce the carriers' aggregate revenue.

The petition said that the carriers now accept the commission's general conclusion that a uniform basic scale should apply, except within New England, but they declared that the basic scale should be higher.

In opposing the port differentials which would be established by the decision for North Atlantic ports and Central territory differentially related as between ports, the petition renewed their request made at the hearing for preservation of the existing relationship. The petition said that the Baltimore & Ohio and Western Maryland consider the maintenance of port differentials incompatible with a mileage scale basis of rates and therefore do not subscribe to this portion of the petition.

The petition restated points made in a petition of Aug. 15, the substance of which was published in THE IRON AGE of Aug. 29, page 553, regarding what was described as the "irreconcilable conflict" between the rate-making rule and the fourth (long-and-short haul) section order, calling for fixing of rates by the most direct hauls, etc. It was declared that the relief granted will often prevent the prescribed rates from being published over the only open working routes. In this connection the petition deals with so-called origin departures and said that, as an instance, the rate from Coraopolis, Pa., to Hudson, N. Y., which would result from the application of the prescribed rate-making rule would become 35c., based on a distance of 500 miles, while the rate from the intermediate origin points on the same route would become 36c. under the same rate-making rule. Numerous other instances of a similar character were cited in an effort to support the contention that the long-haul rights of the carriers comprising the shortest working route would prevent the opening of the rate-making route. Cases were specifically mentioned also in connection with the argument that the equi-distant rule will disrupt prescribed group rates, using the rate-making mileage as a measure.

Among other allegations it was claimed that the order limiting the circuity of routes is inconsistent with the rate-making formula. It was pointed out that the commission approved the grouping of points in the Pittsburgh district and points in the New York metropolitan district, but that the circuity limitation would prevent the publication of the New York rate by way of certain routes to points mentioned in the finding and would result in the publication of higher rates, based on actual distances, to individual points. This, it was argued, would tend to disrupt the New York City group in its entirety and would violate that section of the Interstate Commerce act forbidding discrimination between connecting lines.

Railroads Justify Present New England Iron Rates

WASHINGTON, Oct. 8.—Present rates on pig iron from the blast furnace of the Mystic Iron Works at Everett, Mass., were declared to be justified in statement of exceptions filed with the Interstate Commerce Commission last week by the New York, New Haven & Hartford and the Boston & Maine railroads against the proposed report of Examiner C. E. Simmons, recommending a scale of rates on this traffic. The carriers declared present rates are on the exact level prescribed recently as reasonable by the commission itself for this traffic in New England, except where conditions beyond the railroads' control have forced a depressed basis even lower. The proposed finding, if finally approved, it was stated, would place the commission in the anomalous position of appearing to approve attacks on rate adjustments which it has prescribed as meeting its own standards of reasonableness.

The examiner's report previously was attacked by the complainant on the ground that the scale prescribed was not low enough.

The railroads said that the scale would bring about a rate reduction averaging 10c. a ton on the New Haven, while there would be both decreases and increases for the Boston & Maine. Contention was made that, contrary to the proposed report, reasons for the difference in rates as between those of the Boston & Albany and the Boston & Maine, on the one hand, and those of the New Haven, on the other, are controlling so far as the Boston & Maine is concerned.

The recommendation that the complainant be accorded a rate advantage over Troy, N. Y., because the Mystic plant performs its own industrial switching while the Hudson Valley Coke & Products Corporation at Troy receives a switching allowance, was also attacked. It was pointed out that neither the Boston & Maine nor the New Haven serves the Troy plant nor makes any allowance to it for services rendered by its plant facilities. It was added that the allowance made the Troy plant for this service amounts to 43c. a loaded car, or less than 1c. a ton on pig iron only, and does not apply to traffic paying only a switching charge.

The examiner recommended that the rates from Everett be made 20c. a gross ton lower than the Troy scale, equivalent to $10 a car, with a 50-ton

lading. Moreover, the railroads stated, it would be unsound if not unlawful to permit the question of switching allowance to be reflected in the level of a rate scale. It is recognized, the statement continued, that a carrier cannot be compelled to grant an allowance and must not make an allowance greater than the reasonable cost of the service. The railroads maintained that, if any discrimination is believed by the complainant to arise out of the present situation at Troy, "where the plant has not been operated since October, 1927, the matter should be made the subject of a separate complaint."

Hearing on Texas Steel Rate Reductions Nov. 4

WASHINGTON, Oct. 8.—Hearing on tariff schedules proposing to reduce rates on iron and steel products 7½c. per 100 lb. on carload traffic moving from Atlantic seaboard territory to Texas points by rail-ocean-rail has been assigned by the Interstate Commerce Commission for Nov. 4 at the Sherman Hotel, Chicago, before Examiner J. E. Smith. The schedules have been suspended until April 5. Typical of proposed reductions are those applying to Dallas, which would take a rate of 73½c. from Reading, Pa., against the prevailing rate of 81c., and a rate of 75c. from Bethlehem, Pa., compared with the existing rate of 82½c.

Baldwin to Acquire the Southwark Foundry

The Baldwin Locomotive Works will take over the Southwark Foundry & Machine Co., Philadelphia, the acquisition to be effected by an exchange of 43,000 shares of Baldwin stock for the entire assets of the Southwark company. Close business relations have existed between the two companies for many years.

Samuel M. Vauclain, chairman of the board of Baldwin Locomotive Works, issued the following statement regarding the transaction:

"Baldwin Locomotive has been engaged for some years in gradual diversification of its products into new lines allied with the locomotive industry. It holds substantial investments in four enterprises engaged wholly or partially outside of the steam locomotive industry, namely: Standard Steel Works Co., engaged in making forgings, steel castings and other parts for locomotives and railroad service in general and for other lines of industry; Midvale Steel Co., engaged in the making of large and special forgings and other high-grade engineering specialties; General Steel Castings Corporation, engaged in making a broad line of steel castings for railroad equipment and for industrial equipment, and George D. Whitcomb Co., engaged in the manufacture of oil locomotives for industrial and mining purposes."

Mr. Vauclain said that the Baldwin company's policy of diversification would be continued. It is planned, he said, to carry on the manufacturing operations of the Southwark company in a building of the Baldwin plant at Eddystone, Pa., but the company will be operated as a separate unit.

Gulf States Will Install Notable Plate Mill

To increase the diversity of its products, the Gulf States Steel Co., Birmingham, is preparing to install an electrically-driven three-high 32-in. universal plate mill, embodying a number of features which reflect the tendency toward refinement of rolling mill design. The main drive for the mill consists of a direct-connected 4000-hp. 800-volt, 80/160 r.p.m. adjustable-speed reversing mill-type direct-current motor, receiving power through a 3200-kw. flywheel motor-generator set. This will be the first three-high universal plate mill to have a direct-connected heavy-duty adjustable-speed drive.

One of the new features of the auxiliary equipment is the automatic screwdown control for adjusting the setting of the rolls for each pass, thus to secure a greater tonnage of more uniform and more accurately rolled thin plates with less labor than with the conventional manual control.

Contract for the complete electrical equipment has been let to the Westinghouse Electric & Mfg. Co., East Pittsburgh. Warren Worthington, Pittsburgh, is consulting engineer, and the F. H. McGraw Co., New York is construction engineer.

Good Machine Tool Business in Europe

An extended survey of the machine tool industry in Europe has been made by A. C. Cook, vice-president, Warner & Swasey Co., Cleveland, who returned a few days ago after a five months' trip abroad, during which he visited most of the European countries. "Machine tool business is fairly good in England and France, both in the amount of business the machine tool manufacturers are doing in those countries and in the amount of imports," he said.

"The demand for machine tools in England and France is centering at present around the automotive industry. However, in England the engineering trades are fairly busy and are furnishing business for the British, American and German machine tool builders. France has imported considerable machinery on reparation account. Switzerland and Holland are fairly busy and are buying some English, German and American machinery. Conditions are also fairly good in Czecho-Slovakia, where both American and European machinery is being bought. Austria is flat and there is not much demand for machine tools from either Italy or Belgium.

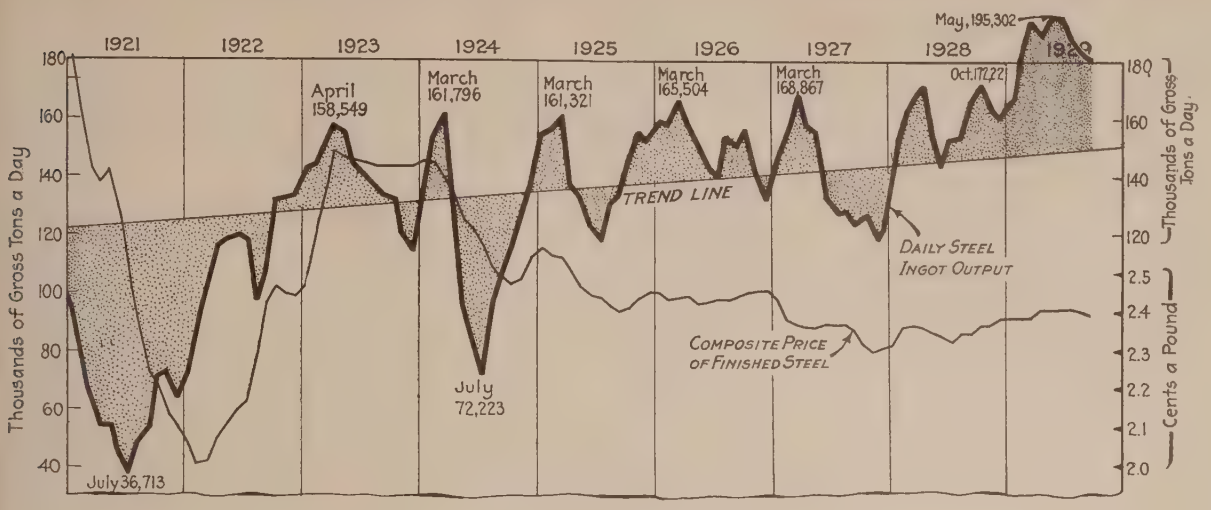
"In Germany business in about all lines is very slow. Some German machine tool plants are fairly busy and some are doing little. I was told that 60 per cent of the machine tools that are being made in Germany are exported. However, I did not attempt to confirm the accuracy of this statement.

"With American tools in Europe it is still the old story of price competition of German made machines. German machine tools are being delivered in European countries at approximately one-half the cost of American tools. It seems to be the general opinion that the cost of manufacturing machinery in both Germany and England will advance because wages are so low that labor may insist on better pay and this would mean higher cost for raw material and for producing machine tools."

Trade Practice Booklet

WASHINGTON, Oct. 5.—The Federal Trade Commission's pamphlet entitled "Trade Practice Conferences" was issued last week and copies are available at 25c. each from the Superintendent of Documents. The pamphlet traces the development of the Trade Practice Conference, explains that its purpose is to cooperate with industry in setting up principles to guide it in voluntarily eliminating unfair methods of competition, and points out that close to 70 industries have held such conferences, adopting more than 300 rules of business practice, with the power of the commission being invoked with reference to less than a dozen of them.

Heavy Ingot Output Was Maintained Through September, Though the Downgrade from the Spring Peak Is Manifest. Finished steel prices are 2 per cent above last year



Steel Ingot Production Continues Heavy

Largest September Ever Recorded, But Lowest Month Since February—Nine Month Total 17.1 Per Cent Above 1928

PRODUCTION of steel ingots in September showed a drop of 8.4 per cent from the August figures, but remained by a wide margin the largest total for any September. The nearest approach was last year, and the increase over that month was 8.7 per cent. The total is calculated by the American Iron and Steel Institute (from returns from companies which made 94.51 per cent of the 1928 output) at 4,510,879 gross tons of Bessemer and open-hearth ingots. Previous to this year, this monthly total had been exceeded by only two months in our whole history—March, 1927, and October, 1928. It is, however, the lowest total for any month since last February.

Daily averages, figured by eliminating Sundays from each month, show for the 25 days of September 180,435 tons, compared with 182,491 tons (revised figure) for 27 days in August. Here again the figure is the lowest since February, but it is higher than that for any month of any year preceding 1929. One year ago production was 165,916 tons a day in September.

Both open-hearth and Bessemer tonnage showed reductions in September from the preceding month. The drop in open-hearth was 9.1 per cent, while that in Bessemer was 4.9 per cent. Compared with September, 1928, however, both forms of steel showed increases, that in open-hearth having been 7.5 per cent, while that in Bessemer was 16.7 per cent.

For the nine elapsed months of the year the total output is calculated at 43,243,404 tons. This is an increase of 17.1 per cent over the 36,930,174 tons of nine months last year, and is the largest on record. Both the Bessemer and the open-hearth tonnages participated in this increase, open-hearth having shown a gain of 17.7 per cent and Bessemer, 13.4 per cent. In passing, it may be noted that only seven complete years of 12 months have shown over 43,000,000 tons of ingots. The first time this figure was reached was in 1917, when a spurt, due to war orders, carried the tonnage to a new high record.

Electric and crucible ingots are not included in the current totals. Production of these two types of steel last year averaged about 1480 tons a day. Some such amount would have to be added to the daily figures in the table to obtain the total ingot output of the country.

Particulars for the past 21 months are shown in the table. The diagram traces the course of ingot production and finished steel prices over the period from the beginning of 1921.

PRODUCTION OF OPEN-HEARTH AND BESSEMER STEEL INGOTS
(GROSS TONS)

1928 Months	Reported by Companies Which Made 94.51 Per Cent of the Steel Ingots in 1928		Calculated Output of All Companies		No. of Working Days

Status of Tungsten-Carbide Tools

Characteristics and Use of New Tool Material Discussed at Machine Tool Congress

THE present status of cemented tungsten-carbide tools and dies was reviewed by Dr. Zay Jeffries, consulting engineer, General Electric Co., at the second session of the Machine Tool Congress, which was held at the Hotel Cleveland, Cleveland, on the evening of Oct. 1. The session was arranged by the machine shop practice division of the American Society of Mechanical Engineers. R. E. Flanders, manager of the Jones & Lamson Machine Co., Springfield, Vt., was chairman.

In outlining the development of cemented tungsten carbide, Doctor Jeffries pointed out that it represents the work of a good many people, in this country as well as in Germany. Referring to the price, he said: "As you all know, the cemented tungsten-carbide material is offered to the trade at what we call a relatively high price. It is, in round numbers, $4.5(per lb. That, of course, is more than the material will cost in the future, and it is a price which none of us expect will be maintained in the industry. On the other hand, the industry is in the process of development, and development costs a great deal of money."

In another part, he said, referring to the price: "It is a subject which will always come up in the discussion; somebody asks: when is the price of the material coming down? If you are using the tools at a saving to yourselves, then of course you don't need to have the price come down to effect some saving; if you are waiting for the price to come down before starting the use of these tools, that is your own loss, provided at present prices you can effect a saving."

Large Field in Wire Drawing Dies

A number of applications of the cemented tugsten-carbide tools were cited. One wire drawing die using this material was said to have drawn 57,800,000 ft. of 0.0108-in. diameter screen wire with a wear of only 0.0007 in. in diameter. At this size the performance was approximately equivalent to that of a diamond die, but with more cuts possible. The overall improvement in cost over the diamond die, on a performance basis, was said to be 6 to 1.

Another example cited was the drawing of 0.105-in. diameter steel wire. Over a 12-day period, 264 chilled iron dies were used to one cemented tungsten-carbide die, which performed without going off size. On the basis of die cost alone the tungsten-carbide die was cheaper than the iron die by a ratio of 36.6 to 18. In addition, 20 per cent more wire was produced by the one tungsten-carbide die than by the 264 chilled iron dies. Cemented tungsten-carbide dies are also being used for hot drawing of tungsten and molybdenum, said Doctor Jeffries, and more will be heard in the future about the use of this carbide in hot drawing of other materials. Tungsten-carbide blanking dies are used by the General Electric Co., for punching transformer disks; a feature of these dies is the production of disks free from burr.

Expects Changes in Machine Tools

Tribute was paid to the machine tool industry for having developed, within the year or more since tungsten-carbide tools were made available, machines that better fit the properties of this new tool material. "If the machine tool builders have appraised this situation during the past year, and after appraisal have decided to spend the amount of money they have spent to build these special machines and think well enough of the future to exhibit those machines at an exposition of this sort (Machine Tool Builders Exposition), you can be assured that if the exposition is not held for another three years you will see a revolutionary change in machine tools."

Will Not Eliminate Steel Tools

In closing Doctor Jeffries said:

"We don't anticipate that cemented tungsten carbide, even though it be made very much more cheaply, or sold very much more cheaply than it is today, will eliminate high-speed steel or carbon steel tools. I strongly suspect that in 1935 there will be as much or more high-speed steel made per year as in 1929, and that is a big year.

"Furthermore, we do not regard this material as a cure-all for everything in the tool industry. Some applications have met with very indifferent success; some attempted applications can be branded at the present time as absolute failures.

Tungsten-Carbide Destined to Have Important Place

"We do not know where this material will lead us, especially from the standpoint of tool substitutions. We are learning, and you are learning; when we put all of our knowledge together we are going to find out what is economical and what is not. It seems to me, however, that we have gone far enough so that we can say definitely that cemented tungsten carbide is destined not only to have a definite place in the future of industry, but a most important place; that it will be used in large quantities and for a great variety of purposes in the future there can be no question, and when I say "it" at this stage, I mean cemented tungsten carbide, or its approximate equivalent, or what may be considered an improvement on existing material.

"This art is so new that we can confidently expect improvements in the future, but even with what we have now and what we know from our laboratory investigations, we can predict without any hesitancy that this material will have a very important place in the future.

"One of the results is going to be the carrying on of this high-speed steel and stellite activity toward greater economic benefits for mankind. It seems reasonable that the material offers the possibility of increasing, on the average, production in machine shops to the extent of 20 per cent, or will make possible the production in five days what now takes six. If that is true it cannot help but benefit all of the people, because machined goods will cost less. It will benefit the metal industries because more metal can be used."

A more extended abstract of Doctor Jeffries address will be included in a forthcoming issue of THE IRON AGE.

Automotive Engineers Arrange Sessions

TWO sessions of the Machine Tool Congress were under the direction of the production group of the Society of Automotive Engineers.

At one of these, held at the Hotel Cleveland on the evening of Oct. 2, F. E. Raymond, assistant professor of industrial research, Massachusetts Institute of Technology, presented a paper on "Economic Production Quantities." E. P. Blanchard, Bullard Co., Bridgeport, Conn., was chairman of this session.

The second S.A.E. session, on the evening of Oct. 3, was devoted to a symposium on the application of standard machine tools and the results due to new features in machine tool construction. A. K. Brumbaugh, engineer, White Motor Co., Cleveland, was chairman.

Joint Production Dinner

The Machine Tool Congress closed with a joint production dinner held at the Hotel Cleveland, Friday evening. This was sponsored by the Society of Automotive Engineers, the American Society of Mechanical Engineers and the Machine Tool Congress. E. P. Blanchard, Bullard Co., acted as toastmaster; he introduced a number of men prominent in the machine tool industry, including officers and former officers of the National Machine Tool Builders' Association. The speaker of the evening was James Schermerhorn, Sr., editor of the *Detroit Times*, Detroit.

At the conclusion of the dinner the chair announced the nomination of John Younger, professor of industrial engineering, Ohio State University, as vice-president in charge of production of the Society of Automotive Engineers.

This Issue in Brief

Saves $6,550 in power bills during 17 months by installing Diesel engine to produce electric current in place of purchased current. Entire cost of operation is only $153.41 a month, and power cost is 1.2 c. a kw-hr. A toolmaker, working in adjacent toolroom, looks at the engine occasionally. —Page 970.

* * *

To reduce power press accidents specify a *safe* die. An expert designer can provide a die which will eliminate accidents, otherwise frequent, and remove the fear which drives efficient operators away.—Page 971.

* * *

Die casting surface improved by use of mold wash which also protects the die. It modifies to a certain extent the speed at which the skin chills when the molten alloy strikes the face of the cool die.—Page 969.

* * *

Quenching in hot aqueous solutions is advocated to take up gap between cooling rates obtained with water and oil at ordinary temperatures. Lack of uniformity due to steam formation can be avoided by circulation.—Page 963.

* * *

Unsafe practices rather than unsafe conditions are accountable for 85 to 90 per cent of industrial accidents. To improve safety record, one should manifest a keen interest in accident prevention, speak to the supervisors about it and congratulate those with good records.—Page 964.

* * *

Welded steam piping reduces insulation maintenance costs. When gasketed joints leak, water - logging of expensive molded insulation results.—Page 966.

High-strength structural steels can best be made by increasing the manganese content, tests reveal. Raising the carbon content is much less satisfactory.—Page 962.

* * *

Hoisting rope failures are due to abuse rather than fatigue, says engineer. High fatigue limit is not the most important property of wire rope, he says, but the capacity to resist destruction from overstressing and wear.—Page 956.

* * *

When one buys machine tools, there are five questions the salesman should answer. Buyer wants to know that the maker is reliable, that the machine is not a patent infringement, what production he will get, when the machine will be delivered, and the range of speeds and feeds.—Page 979.

* * *

Pickling time is directly affected by the kind of finish on the steel surface. Weight of zinc coating is affected by the finish and also by the length of pickling time.—Page 957.

* * *

In heat treating, parts can be conveyed through furnaces by any of 13 different mechanisms. One of the most desirable types is the "walking beam." Little power is required, no trays are needed and a great variety of parts may be conveyed without injury.—Page 962.

Thousands of dollars saved manufacturers by "spark testing" method of sorting steels which have become mixed. Trained spark testers quickly identify different grades of steels by noting characteristics of sparks thrown off by grinding wheel.—Page 956.

* * *

Cuts cost of high-strength structural steel by alloying with small quantities of copper and chromium instead of silicon. The new steel welds more easily and is more resistant to corrosion.—Page 962.

* * *

Life of die increased tenfold by finding the right quenching mixture. Tool steel die to stand 200,000-lb. pressure lasted only 3000 to 5000 operations. When properly quenched, the dies lasted for 50,000 operations.—Page 963.

* * *

Secret price cuts will be regarded as "unfair and improper trade practice." Trade practice conference rules require reinforcing bar industry publicly to withdraw published prices when new prices are established. Submission of two bids is frowned upon. —Page 978.

* * *

Machinery exports decline. August total of more than 50 million dollars worth was over 6 millions below July figure. But eight-month total is 24½ per cent above same period of 1928 and a new high record for the period.—Page 1015.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Use Steel and Plenty of It.

TIME was when much cast iron was used in building construction. It was the standard material for columns and compression members in trusses. Some of the bolder architects installed cast iron beams to carry wooden floor joists, or cast iron plates to ornament a pretentious exterior. Rolled beams of mild Bessemer steel then supplanted the iron ones, and terra cotta or other ceramic product has pre-empted the decorative function. Cast iron seems to be left only a minor market for columns for three- or four-story buildings.

That the possibilities of this reliable material in the building field have not been exhausted, however, is proved by a recent use of solid cast iron, strangely enough, to reinforce concrete. It is well known that concrete buildings have a distinct limit of height beyond which they become uneconomical. The dead load of the bulky concrete becomes such an increasingly greater multiple of the live load, as the building gets taller, that a height is soon reached where the lower floors would have little room for aught else but huge columns. But by carrying these heavy floor loads on cast iron, a much stronger material in compression, the size of the columns can be kept in control. Thus a 16-story concrete building for heavy manufacturing can be supported by columns at 20-foot spacing and no larger than 24 inches square, if the center is a solid cast iron core of 11 inches diameter.

This rather bizarre situation results from an intelligent effort to utilize tried and true building materials to the best advantage. A similar and even more striking achievement can be made by those who break away from the conventional reinforced concrete design, where the ideal is to use a minimum of steel and a maximum of concrete. This thought can best be developed by a reference to the problems of bridge design.

Engineers ordinarily assume that a highway floor slab plus a 2-inch asphalt wearing surface will weigh about 135 pounds per square foot. (This does not include the beams and stringers necessary for support.) Of this 135 pounds, about 10 pounds would be reinforcing steel, 100 pounds concrete and 25 pounds asphalt. Much of the truss work is therefore necessary merely to support this floor slab. For instance, in a steel suspension bridge of moderate length half the entire weight is concrete. This dead load obviously becomes a factor of major interest in long-span bridges.

Since an 8-inch slab is about as thin as is practicable with loose-bar reinforcement (owing to variations in setting the individual bars and liability to derangement during pouring) one way to economize on weight is to use trussed members for reinforcement, either pressed out of special steel shapes or made of rods welded together. Such means were used on the Philadelphia-Camden bridge, where a 6-inch slab of concrete with the following characteristics was used for a floor as strong as the heavier slab mentioned above:

Weight of steel.....	8¼	lb. per sq. ft. of floor
Weight of concrete.....	72¼	lb. per sq. ft. of floor
Weight of asphalt	25	lb. per sq. ft. of floor
Total	105½	lb. per sq. ft. of floor

In a big bridge or a big building this saving of one-quarter the weight of the floor would mean a great economy in the supporting structure, and far overbalance the increased proportion of steel in the slab itself. In fact, if the amount of steel is increased to where it equals the weight of concrete the saving is even more impressive. L. S. Moisseiff, advisory bridge engineer for the Port of New York Authority, has tested slabs of this sort. The steel is a row of inverted tees set so that flanges touch. The upstanding legs are slotted at 3-inch spacing and transverse bars pressed into them, making a steel checkerboard. When filled flush to the top with abrasion-resistant concrete it is a self-contained unit, with an enduring surface under traffic without need of asphalt. For equivalent strength to a standard highway floor it is about 3¼ inches thick and weighs 60 pounds per square foot, half steel, half concrete.

One might object that in such a design the steel is not working to maximum efficiency; that is, the concrete spalls before the steel stretches. But this overlooks the overall efficiency of using steel and plenty of it. Such a "waste" of steel cuts the weight of an ordinary floor slab in half; it makes corresponding savings in the supporting structure; it reduces the thickness from 8 to 3 inches (which means 4 per cent of the height of a tall building), and reduces the form work to zero.

In view of these achievements, the saying that the steel is working inefficiently falls flat. Use steel and plenty of it. In the end it will turn out best and therefore cheapest.

NATURALLY the recovery of the Russian steel industry from the effects of the war might be expected to be slower than that of other European nations. However, the Soviet Government evidently has been very successful in reorganizing and operating blast furnaces and steel plants. Today for the first time in over ten years the industry is again on a

pre-war basis. In 1913 Russia's production of pig iron was 4,145,000 gross tons or 345,500 tons a month. Reports thus far available for 1929 show a rate of 358,100 tons a month, indicating a yield of about 4,300,000 tons for the year. In steel Russia made 4,760,400 tons or 396,700 tons a month in 1913. The present rate of production is 390,300 tons a month. With 410,400 tons and 411,500 tons for the last two months reported, Russia's 1929 output may easily surpass that of 1913. Reports indicate large expansion in new plant as the future program, under the cooperation of American mechanical and metallurgical engineers. It would be quite premature to speculate on what this program may hold of possible competition in markets now occupied by the leading steel-producing countries of Europe. Russia's uncertain place in international diplomacy will prevent that question from being a live issue for a good many years. Meanwhile, however, Russia promises to be less and less of an importer of steel—a matter likely to be of most concern to the German makers, since the latter have chiefly benefited from that trade since the war.

The Next Upturn in Steel

WITH steel production off between 10 and 15 per cent from its peak rate of last May and June, and with further decreases probable, this is exactly the right time to refer to the next upturn. With the decline every one is familiar and the prospects of an upturn need to be brought out. While steel diverged from its usual seasonal swing in the past spring and summer, we may feel reasonably certain that of any decline that may occur in November and December a part will be seasonal, there being ample precedent for such an appraisal.

There are impressive precedents to be reviewed, showing that it is perfectly normal for steel production to turn upward immediately after December. When the entire second half of a year has been bad the recovery in the new year is more pronounced, but even after a good second half there is a substantial increase over the December rate. In seven consecutive years there has been no exception.

The comparison is made in the table below, which shows the increase in the rate of steel ingot production from December to the peak month of the first half of the new year, which was also, except in the case of 1928, also the peak month of the whole year.

Peak Month Gain Over Preceding December

	Per Cent
1923, April	20.0
1924, March	41.2
1925, March	17.5
1926, March	8.4
1927, March	27.1
1928, April	41.5
1929, May	21.5
Average	25.3

The large percentage gains, of course, occurred after years with poor endings. Both 1923 and 1927 ended poorly, but instead of that constituting an unfavorable augury for the new year there was all the greater percentage recovery. Indeed, the respective high months represented in the above compilation varied remarkably little from each other in actual tonnage rates. Rather, it was the respective low rates that varied from each other. When the daily rates each month are plotted it is seen that the peaks in the years 1923 to 1928 inclusive are quite uniform, with a slight annual rise, the notable divergence being that the 1929 peak represented a large rise. The troughs, on the other hand, vary greatly. Ingot production since 1921 is plotted regularly in THE IRON AGE, in connection with the monthly report, the present issue containing a fresh plot on page 985.

With the last seven years unanimous in recording an increase in steel production after the final month of the preceding year, it is clear that an upturn is to be expected after next December. If that does not occur it will be by reason of sweeping changes in the general trade and financial situation, so unusual as to be easily recognized as making a new situation, contrary to the plainly marked precedents. It is needless to say no such sweeping change is now in prospect.

Electroplating Grows Apace

WITH the development of chromium and cadmium plating in recent years, the electroplating industry has reached large proportions. This was impressively brought before members of the Institute of Metals during the recent National Metal Congress at Cleveland in a review of progress from the earlier days. Zinc plating was the first crude discovery. This led to plating with nickel and silver—used now for many years. Then followed copper, gold, tin, lead, and, more important, dual plating with brass and bronze; chromium and cadmium being the latest additions to the list.

In a single year now about 10,000 tons of zinc, 3000 tons of nickel and already close to 300 tons of chromium are used in plating, with the last named increasing rapidly. Cadmium has come into such favor that it is scarce and selling at a dollar a pound. If electrolytic refining be taken into consideration—copper, zinc and other metals—the industry takes on imposing proportions, for electrolytic refining is akin to electroplating.

One development is unfortunate. Not a little chromium plating has been unsatisfactory, so much so that certain automobile plants are turning to other products, stainless iron in particular. There is a right and a wrong way to plate with chromium. Here and there companies have cropped up which have not followed the approved practice and the work of some of these has impeded the progress of the industry.

Future of Investment Trusts

IN a previous editorial (Oct. 3) we explained that there is no magic in the philosophy of the investment trusts. Their theory is simply better financial conduct than is within the capability of the ordinary individual, either owing to his inferior intelligence, or his inferior resources, or both. However, those are good reasons why a small investor should join others and put the combined fund in the hands of a good manager. Manifestly an individual who had ten million dollars to invest, which he had accumulated by his own acumen, would have no such reasons. He would be an investment trust in himself and might not be interested in participating in a society unless he

were going to transfer to it some of his own securities at a high figure, which is suspected to have been done in some instances.

A clear idea of the operation of the common form of investment trusts may be obtained from almost any issue of the financial journals. One of them, for example, related the conspicuous success of a new concern sponsored by Boston bankers, which obtained 15 million dollars by public subscription, put it into the stocks of public utility companies during the August break, and now possesses a portfolio of 16 million dollars of quotational value.

In the same issue was listed the portfolio of another trust, which had an aggregate of $14,250,000 in quotational value, that was $2,700,000 in excess of cost. This portfolio comprised $12,800,000 of common stocks, spread among 24 issues, all of which were of first-class character.

An ordinary individual investor would not have had the means, and probably neither the temerity nor judgment, to have bought during the August break; and if he had the means to diversify among 24 common stocks his private portfolio would doubtless have comprised some weaklings and some wildcats, which that of the trust did not.

The investment trusts that are to be shunned are those that are merely speculative pools, buying on margin, selling short, engaging in all sorts of speculative maneuvers. These differ from partnership pools only in that they diversify themselves and expect to be continuing, but with the probability that a serious reverse would end them.

On the other hand there is a high type of investment trust that devotes expert study to the approaching development of new sources of wealth—the copper mines of Northern Rhodesia, for example—and invests in their shares, along with other things for diversification, awaiting increment in real value.

A perplexing feature of the vogue for investment trusts is their effect upon the stock market. We may safely deduce that this is discriminating. Their expert managers pass by the stocks that are dubious and concentrate upon those that are most promising. This has probably contributed to the selectiveness of the stock market during the last year. We may further deduce that in the event of a reaction in the market they would exert powerful buying.

Less simple are the effects of the loaning of their funds and speculation in the shares of investment trusts themselves. Altogether we have new influences in our financial affairs. On the whole they seem to be good, but they may lead us into unforeseen perils.

CORRESPONDENCE

The Mystery of the Increase of Brokers' Loans

To the Editor: The original purpose of collateral loans to brokers, namely, speculative trading in stocks, is no longer the only important cause of the long-continued increase in such loans. General increases in margin requirements have not caused contraction in the volume of brokers' loans; neither has the selling of stocks in the brief periods of falling prices. An increasing volume of buying orders for securities, without a counterbalancing volume of selling orders, must actually exist.

A high authority in banking has outlined another important influence in maintaining loans on securities at a high level. Wealthy men who invest capital in stocks on a rising market are liable to heavy surtaxes if, by selling the stocks, they take the profit into their income account. It is a fair inference that many security holdings showing a profit are therefore left in brokers' hands as collateral for loans, the funds from which may be used for purposes other than speculation. Abolition of surtax on profit obtained from capital used in the purchase and sale of securities would cause the liquidation of such frozen collateral loans, and leave the credit free to be used in other forms for the varying needs of industry and commerce.

An increasing number of people are apparently interested in buying stocks for investment. They are thoroughly familiar with the idea of ordering expensive articles and paying for them out of future earnings; so they order their investment securities at the time their interest is attracted, making an initial down payment and putting in the rest later as income may permit. These purchasers pay little attention to daily market changes. They are reluctant to sell at a loss, and in no hurry to sell at a profit. As their cash investments increase, they are open to suggestions for purchasing other securities; and so the amounts of their loans grow larger. Increase of brokers' loans for this purpose is an evidence of thrift, and is therefore to be encouraged.

It would probably be difficult, but it should not be impossible, to make a study of the situation and discover the approximate distribution of brokers' loans between the accounts of active speculators, temporary maintainers of paper profits, and investors of expected savings. This last group may form a larger proportion than any one has yet supposed. If ever the talent which has already developed the installment purchase system for manufactured articles should extend it to securities, the volume of financing which would become necessary would go far beyond the present large figures of loans on collateral. B. S.

New York, Oct. 3.

Soderberg Electrodes in Steel Furnaces

To the Editor: THE IRON AGE of Aug. 22, page 461, contains an abstract of an article by St. Kriz in *Stahl und Eisen* about electric steel furnaces in Germany. Some information about Soderberg electrodes may easily be misconstrued. Although the author does state that the Soderberg electrodes of larger sizes give a somewhat lower consumption than ordinary pre-baked electrodes, he puts the consumption at 44 lb. per ton of solid charge.

Soderberg electrodes in steel furnaces have been developed during the last four to five years, and the equipment as well as the way of making these electrodes are as yet far from uniform. Recent improvements have not been taken advantage of all along, and the results, therefore, vary quite a little. Furthermore, it is well known that the electrode consumption depends entirely upon the time used for each heat as well as upon the number of slags. Consequently a figure, like the one above referred to, does not mean anything except when explained.

The following results reported from one of the later installations seem more up to date. The figures are from a 20-ton Heroult steel furnace with three Soderberg electrodes, 28 in. each, in a solid charge: Electrode consumption, when making ordinary steel ingots for rolling mill, is approximately 17 lb. per net ton. For high-quality alloy steel, electrode consumption is approximately 32 to 34 lb. per ton.

Steel Founders to Meet in Chicago This Month

Makers of steel castings will be invited to an open meeting in Chicago in the last week of October to consider a report on conditions in the steel foundry industry in the United States and Canada and to take steps looking to a new plan of organization of the Steel Founders' Society of America together with a five-year program of activities. Granville P. Rogers, managing director of the society, 932 Graybar Building, New York, presented the results of an extensive survey to a meeting of the executive committee of the society at the Hotel Roosevelt, New York, Oct. 4. The report covered, among other things, the study of waste elimination, undesirable trade practices and market researching to widen the use of all types of steel castings.

The report and plan were enthusiastically received by the committee and the result is a call for the meeting to be issued shortly by the president of the society, John E. McCauley, president, Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa. Representatives from the steel foundries of Canada as well as the United States are expected at the Chicago meeting.

Salesmen and Purchasing Agents to Have Exhibit

The Salesmen's and Purchasing Agents' Association of America, Inc., with headquarters at Bridgeport, Conn., will hold its second cooperative exhibit at the Pyramid Temple Mosque, Bridgeport, Oct. 17, 18 and 19.

More than 120 companies have contracted for space, and the exhibits will include tool and other steels, small tools, electrical equipment and general factory supplies. There will also be demonstrations of tungsten-carbide cutting tools.

R. T. Phipps, Bullard Co., Bridgeport, is president of the association. W. H. Bradley, Hunter & Havens, is vice-president; L. R. Watkyns, Max Ams Machine Co., is secretary; and F. H. Braithwaite, Wellington-Kincaid Co., Inc., is treasurer.

Machine Tool Dealers Elect Officers

The Associated Machine Tool Dealers at their annual meeting held in Cleveland, Oct. 3, elected the following officers:

President, E. P. Essley, E. P. Essley Machinery Co., Chicago; vice-president, J. W. Wright, Colcord-Wright Machinery Co., St. Louis, and secretary, A. G. Bryant, Joseph T. Ryerson & Son Co., Chicago.

Three new members were elected to the board. They are: William K. Stamets, William Stamets Co., Pittsburgh, W. R. Stedfast, Stedfast & Roulston Co., Boston, and A. G. Bryant.

The Week in Business

Drift of Current Financial and Economic Opinion

SEPTEMBER was a month of liquidation in the stock market. Measured by the Dow-Jones industrial average, the decline in prices from Sept. 3 to Oct. 3 was 13.4 per cent—a sharper drop than occurred in May, 1929, June or December, 1928, or October, 1927.

Beginning last Saturday and continuing on Oct. 7 the securities markets rallied, and it is again a question, according to Alexander D. Noyes of the New York *Times*, whether the time has come for a frank recognition of realities or whether there will be continued confusion of intrinsic values with values arbitrarily established by a speculative craze.

The *Annalist*, in its issue of Oct. 4, unreservedly takes the view that the recent decline "marks definitely the end of the bull market," although predicting that a sharp rally would develop "some time during the coming week."

The Harvard Economic Society, on the other hand, looks for no "prolonged period of liquidation," while conceding that the recession "may go further and is likely to react unfavorably on business." It counts on the Federal Reserve system to ease money if business curtailment should reach undue proportions.

The probability of such action must be weighed in the light of the further expansion of brokers' loans and the alarm it has caused among leading American bankers. Such loans, according to the New York Stock Exchange compilation —which is more comprehensive than the Federal Reserve reports —reached a total of more than 8½ billion dollars on Sept. 30. The gain since August, in the face of falling securities prices, was two-thirds of a billion dollars and the increase in the four months from May 31 to Sept. 30 was close to two billion dollars.

The fact that additional loans have been mainly from "others" cannot be safely construed as indicating that the banks are unaffected. Speaking before the American Bankers' Association at San Francisco last week, Craig B. Hazlewood, that organization's retiring president, said:

"It is definitely known that many of our banks . . . have increased their loans on collateral securities to peaks never before attained. Some of them are overloaned—in some cases they are borrowers and in some cases, even if they are not borrowers, they have exhausted their secondary reserves."

Emphasizing the banker's responsibility in curbing the excessive use of credit for carrying stocks, Mr. Hazlewood declared, "There is a limit, and a very definite one, beyond which bank credit in this country must not be extended if we are to preserve our gold standard."

Recession in the stock market has been partly due to large realizing sales by British speculators, according to James B. Clews, Henry Clews & Co., New York. On this account and also because of the advanced English discount rate a large back-flow of money to London is getting under way. This turn, says Mr. Clews, has attracted attention in Washington, where a continuance of gold imports in recent volume is regarded necessary to support securities values at anything like the present level.

Besides threatening to reduce the gold base underlying our bank credit, the higher British discount will also impose a larger portion of the financing of autumn foreign trade on New York banks, according to Preston S. Krecker in *Commerce and Finance*.

A general recession in our exports is seen as an early possibility by some commentators. The decline in our shipments abroad in August, when a seasonal increase was to be expected, is interpreted by the Alexander Hamilton Institute as a result of this year's sharp contraction in foreign loans. But the general volume of business in this country remains large, according to the Harvard Economic Society, and in directions in which seasonal increases are most marked, such as wholesale and retail trade, activity has expanded. Autumn business, the Harvard review says, will rank high if comparison is made with previous years rather than with the unusual level of summer.

Iron and Steel Markets

Further Decline in Steel Production

Prospective November Upturn in Automotive Requirements and Impending Railroad Specifications Promise to Halt Recession

STEEL production has declined further, but developments of the week lend support to the belief that the low point in demand may have passed.

The movement of finished steel to the automotive industry, the principal factor in causing recent curtailment of mill operations, is now the smallest in more than a year, but orders placed in the past week point to some measure of improvement in November. Railroad buying continues to expand, structural steel business is heavy, farm equipment makers are taking more steel and requirements for barges and ships are in encouraging volume.

October promises to be a transition period in steel output. With steel specifications from the motor car trade at a low ebb, heavier releases are beginning to come from other sources, notably the railroads and builders of railroad equipment. Chicago rail mills will increase operations in the next week or two and the now idle plants at Pittsburgh and Ensley will soon resume production.

Steel companies serving the railroads are operating at a better rate than those with a less diversified output. The Steel Corporation average continues at 89 per cent of capacity and the rate for other mills with a similar range of products is estimated at 85 per cent. Independents relying more largely on the automotive trade are running at 75 to 80 per cent.

The extent of the impending recovery in motor car production is uncertain. Recent published announcements notwithstanding, the activities of parts makers and the movement of materials definitely point to the bringing out of new models by both of the leading makers of low-priced cars. The Chevrolet company's new car is expected to get under production in November on a schedule calling for the completion of 130,000 units in that month and December, a combined output that would fall short of the total for the single month of July.

Price developments have been influenced by the recent falling off in automotive steel requirements. Sales of automobile body sheets for November delivery brought out concessions of $2 a ton. Shading of blue annealed sheet prices is more extensive, and black sheets have undergone a rather general decline of $2 a ton to 2.75c., Pittsburgh.

Further weakness in wire products has wiped out the $1 a ton differential at Chicago, where wire nails at $2.45 and plain wire at $2.40 are now on the same quoted bases as at Pittsburgh and Cleveland.

The downward tendency of scrap prices has not been checked. Heavy melting steel has declined 50c. a ton at Pittsburgh and St. Louis and 25c. a ton at Cleveland.

New rail business of the week, including 62,000 tons for the Louisville & Nashville and 30,000 tons for the St. Louis-San Francisco, will add materially to the backlog of the Ensley mill.

Railroad freight cars placed total 3500—2000 for the Southern, 500 for the North Western and 1000 which the Pennsylvania will build in its own shops. Cars ordered in the past fortnight number 7200, or nearly one-tenth the total for the entire year up to Oct. 1. Additional orders for 2500 and 2000 cars respectively are expected from the Southern and the North Western, while the Louisville & Nashville and Great Northern are prospective buyers of 3000 and 1000.

Fabricated structural steel inquiries, at 92,000 tons, are the heaviest of the year. Of this total 63,000 tons is for the New York district, with 21,000 tons in the market for the Manhattan freight terminal of the Lehigh Valley Railroad and 18,000 tons for the Cornell Medical Center. Fabricating awards totaled 22,000 tons, compared with 50,000 tons last week.

Foundry operations reflect a shifting of activity. Melters of pig iron serving the automotive industry are buying from hand to mouth instead of for the full fourth quarter, because of the uncertainty of their requirements. Pig iron demand has improved from stove, furnace and radiator manufacturers and foundries supplying the railroads. Two steel foundries in the St. Louis district have bought 25,000 tons of basic iron.

Supplementary buying supplies most of the current activity in pig iron, since formal fourth-quarter contracting is largely completed and interest in first quarter needs is not yet active. The latest evidence of a stronger price attitude by Alabama producers is the marking up of prices on iron for delivery in the Chicago district to $13.50, Birmingham, an advance of 50c. a ton.

Steel ingot production in September, at 4,510,879 tons, declined 416,379 tons, or 8.4 per cent from the August total but exceeded the best previous September output, that of last year, by 8.7 per cent. The daily average, as computed by the American Iron and Steel Institute, was the lowest since February. Production in the first nine months set a new high mark and was 17.1 per cent larger than in the corresponding period in 1928.

The Hatry collapse in the London stock market is attributed to the failure of the Austin Friars Trust, a Hatry company, to obtain control of the United Steel Companies as a step in the formation of the proposed Steel Industries of Great Britain, Ltd.

THE IRON AGE composite price for finished steel has declined from 2.384c. to 2.369c. a lb., its lowest level this year. The pig iron composite remains at $18.29 a ton.

Pittsburgh

Low Point in Steel Demand May Have Been Passed—Automotive Parts Specifications Slightly Improved

PITTSBURGH, Oct. 8.—Although the steel industry in the Pittsburgh and nearby districts is faced with tapering production schedules over the greater part of the present month, slightly heavier specifications in a few lines in the last week have led to the belief that the low point in demand may have been passed. It is also significant that improved specifications were reported as coming from makers of automotive parts, which are anticipating heavier demands early in November from the industry which they serve. Just now the movement of finished steel to automobile makers is at the lowest point in more than a year. Lack of demand from this channel is the largest single factor in bringing about a decline in steel production. With anticipated model changes by both the large makers of low-priced cars and unusually heavy dealer stocks of all kinds, it would not be surprising if improvement from this source would be slow in coming and of a very gradual nature.

With such conditions in its largest consuming industry, the steel business is looking to other outlets for the fourth quarter and expects to find them in heavy purchases of railroad equipment, continued strong demand for structural steel for bridges and public works and, in the Pittsburgh district particularly, in the large requirements of machinery and mill equipment builders.

Nearly all the large steel companies are taking advantage of the present lull in production to make badly needed repairs and replacements in their plants.

Operations in the Pittsburgh district will fall under 85 per cent this week for the first time in several months, and in the Valleys the average is scarcely more than 75 per cent. Smaller nearby centers approximate the Valley rate. The Pittsburgh area is held up by the well sustained output of the Steel Corporation subsidiaries and the leading independent producer.

Finishing mill operations are on a hand-to-mouth basis in all departments. The strip industry ranges from 50 and 60 per cent of capacity, while sheet mills, which have been the last to feel depression, are now down to about 80 per cent. The leading sheet interest is at a slightly higher rate. Tin plate production has held up remarkably well, and mills will begin rolling anticipated tonnage for next year before another month has passed. Plate and shape mills are fairly well engaged. Bar mills, which had dropped to a rather low point, are stepping up production gradually.

The muddled price situation, which has existed for several weeks, has undoubtedly resulted in delayed orders by many consumers. On hot and cold-rolled strip, present quotations seem to be holding, although concessions are not uncommon, particularly on the wider sizes of hot-rolled material. Galvanized sheets have not declined below 3.50c., Pittsburgh, but black sheets now seem to have eased off $2 a ton to 2.75c. Mills continue to quote the higher fig-

ure, but nearly all are meeting the lower price, notably on the heavy gages and full pickled stock. Despite reports of shading on blue annealed sheets and light plates, the market is still fairly represented in this and the Valley district at 2.20c., Pittsburgh, on the No. 10 gage and 2.35c. for No. 13. Wire and wire nail prices have developed no further weakness in this territory and are becoming established at $2.45 a keg on nails and at 2.40c. a lb. on plain wire. Concessions in wire are confined entirely to the jobbing trade. Billets, slabs and sheet bars are unchanged at $35, Pittsburgh or Youngstown, and wire rods are now generally quoted at $40, Pittsburgh or Cleveland. Bars and shapes are still quotable at 1.90c. to 1.95c., Pittsburgh, while plates are holding at the higher figure.

The pig iron market is quiet, and prices continue to hold. Scrap is off 50c. a ton on the basis of sale of a large part of the Pennsylvania Railroad list at less than $17.50, delivered.

Semi-Finished Steel.—Demand for billets, slabs and sheet bars is rather quiet, as most users have steel coming to them on third quarter contracts, and present prices offer little incentive to cover for the remainder of the year. Occasional reports of shading the $35, Pittsburgh or Youngstown, price are heard, but this figure seems to be holding in all open market transactions. It is admitted that large consumers of unfinished steel, depending constantly upon one source of supply for their material, are not paying this price, but the small buyer is not getting the advantage of concessions. The same situation holds true in the case of forging billets, on which the present quotation is $40, Pittsburgh. Wire rods have settled to $40, Pittsburgh, and most makers have revised downward the fourth quarter contracts of their principal customers. Shipments of rods are not up to the September rate so far this month.

Pig Iron.—The pig iron market remains inactive, although small tonnages are being sold regularly and consumers are occasionally coming into the market for their fourth quarter requirements. A small tonnage of malleable was sold to the Pressed Steel Car Co. at McKees Rocks, Pa., and brought the full Neville Island base plus freight. The Walworth Co. is said to have bought foundry iron for its Greensburg, Pa., plant, and a part of the tonnage required by the Richmond Radiator Co. for its Uniontown, Pa., plant is reported to have been placed. The American Steel Foundries, which recently bought basic iron for Alliance, Ohio, also placed a small tonnage for its works at Verona, Pa. The Standard Sanitary Mfg. Co. has not yet come into the market for its Pittsburgh plant, and this purchase is now expected to be further delayed. Pig iron shipments this month are up to the September rate, and leading merchant furnace interests are having no difficulty in disposing of their regular daily production. Steel company interests are competing for business on the same basis as merchant stacks.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Bars, Shapes and Plates.—Pittsburgh mills are not yet beginning to receive heavier specifications from the railroad car builders which have benefited by recent car awards, but have been called upon frequently in recent weeks to protect car builders in their bids on large railroad inquiries. It is believed that the present car buying movement is going to be heavier than general inquiries would indicate, as at least one large order for rolling stock is being placed quietly. The Baltimore & Ohio, which was mentioned last week as a probable buyer of 7000 freight cars, is reported to have placed part of this order tentatively some time ago. Pittsburgh district mills will share in the steel requirements of the Pennsylvania Railroad, which has placed 1000 freight cars with its Altoona, Pa., shops. This road is also expected to build at Altoona 25 of the 100 locomotives for which it is inquiring. Plate makers in this district are also expected to benefit by barge buying in this district during the next two months, although the only large inquiry before the market at present is that of the Standard Unit Navigation Co. for 50 barges, which was mentioned previously. Structural awards in the immediate Pittsburgh area have been light in the last few weeks, but fabricating shops are fairly well engaged on small jobs. Large pending projects around here are slow in development. Bar business is only fair, but specifications are about equal to the September rate. New buying is coming out slowly. Some mills are holding to 1.95c., Pittsburgh, on bars and plates. On bars, however, large buyers are getting 1.90c., and some contracts have been revised to this figure. Small buyers are meeting with difficulty in getting the 1.90c. price. Demand for plates is stronger, and this probably explains the steady price on that product.

Rails and Track Supplies.—The larger carriers have not yet closed against their recent rail inquiries, but action is expected in the next week on both the Pennsylvania and the New York Central tonnages. The former road has not yet closed for its fourth quarter track accessories. The Chesapeake & Ohio has placed 10,000 tons of tie plates with the Wheeling Steel Corporation, but has not yet ordered its spikes, which total 7000 kegs. The Louisville & Nashville is also inquiring for 9500 kegs of spikes, but has not yet issued its rail inquiry. The Pere Marquette expects to buy 5000 tons of tie plates. Mills in this district have not got under way on their rail rolling schedules, but probably will before the end of the month. Specifications for track accessories are not heavy, but seasonably satisfactory.

Wire Products.—Prices on wire and wire nails have weakened no further in the last week, with nails holding at $2.45 to $2.55 a keg and wire at 2.40c. to 2.50c. a lb., Pittsburgh. The higher figures are not applying on much tonnage. Producers are successfully holding the price of manu-

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	48½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 8	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

facturers' wire at 2.40c., although the price to jobbers is not so strong. Demand for both wire and wire nails is slow so far as jobbers are concerned, and manufacturers' wire is not moving so well as it was a few weeks ago.

Tubular Goods.—Pipe demand continues fairly good, and some makers feel that the demand from the oil country has picked up in the last two or three weeks. However, distributers' stocks in those territories are large, and it is some time after heavier drilling operations are undertaken before the pipe industry feels the improvement. At present there is no prospect for sustained activity in that direction, as the oil industry is still mainly interested in curbing production. An order was recently placed for about 90 miles of 6-in. pipe, totaling close to 3000 tons, for a gas line which the Indiana Consumers Gas & By-Products Co. will lay from its plant at Terre Haute, Ind., to connect with the Insull properties in the Chicago district. No large natural gas line projects seem likely to be placed in the near future and no heavy tonnages of this sort may come out before the first of the year. Lap-weld mills in this and nearby districts are running at 65 to 70 per cent of capacity and seamless units are slightly busier. Demand for mechanical tubing continues to drop off, but there is a fair movement of boiler tubes.

Sheets.—If the first week can be taken as a criterion, October will be the low month so far in the year in the sheet industry. Specifications have fallen off in the last few days and declining demand is reported from industries other than the automotive. Nearly all the larger mills have now practically exhausted their backlogs and are gradually being reduced to a hand-to-mouth operating rate, which probably averages from 80 to 85 per cent of capacity. Mills are taking advantage of this opportunity to make needed repairs to their equipment, as the industry has just rounded out a full year of near capacity operations, and the present lull is not expected to be extended. The automobile industry will not improve its production this month, but the two large makers of cars in the low-priced field will probably begin to take steel again in a large way by the middle of November. Sheet prices continue very weak, with buyers pressing for lower quotations and many sellers agreeing to concessions on all the common finishes. Black sheets are quotable at 2.85c., Pittsburgh, but this price is subject to shading to 2.75c., and the 2.20c., Pittsburgh, price on light blue annealed plates has been shaded to 2.10c. The market on galvanized sheets seems to have settled to 3.50c., Pittsburgh, and automobile body sheets are easily purchased in considerable tonnages at 4c. Weakness is also reported in long ternes.

Tin Plate.—Shipments in September were exceedingly high for that month, with some makers reporting new high records for the ninth month. Operations this month average from 75 to 80 per cent of capacity among the independents, while the leading interest is at a slightly higher rate. Makers are actively negotiating for next year's tonnage, and most of the important contracts will be settled before the end of the month. Operations are not expected to decline much further, and a gradual upturn will likely occur in the early part of November.

Strip Steel.—Strip makers are feeling keenly the decline in automotive demand, and cold-rolling mills in this and nearby districts are not operating at more than 50 per cent of capacity. Hot mills are about 10 points higher, but operations are on a hand-to-mouth basis and may decline still more before improvement sets in. However, automotive parts makers are beginning to increase their specifications slightly in anticipation of heavier automotive demand within the next 30 days. Prices are not strong, but, with operations at such a reduced rate, not many makers are willing to take business at what would be an almost certain loss. Cold-rolled strip is still quotable at 2.75c. to 2.85c., Pittsburgh or Cleveland, the higher price continuing to be applicable to a small tonnage in this district. On hot-rolled strip the narrow widths are still quotable at 2c., Pittsburgh, and the wider sizes at 1.90c. Tendencies toward shading are more pronounced on the latter.

Coal and Coke.—Demand for domestic coal and coke has improved seasonably this month and is about normal for this time of the year. On furnace coke, however, the market is still weak and, with the promise of little steel company demand in the next month or two, prices are unchanged at $2.65 to $2.75, Connellsville. There has been a slight improvement in the movement of foundry coke, but the situation has gained little real strength. Coal prices have not changed materially.

Old Material.—Dealers were given added reason for pessimism by the low prices reported to have been paid for the Pennsylvania Railroad steel scrap, a large part of which is said to have brought as low as $17.35 at a nearby consuming point. Some of the steel went at slightly more, but the average paid for the heavy melting in the list was certainly not more than $17.50. The Baltimore & Ohio list, which was awarded this week, is said to have brought about $17.75 for steel scrap, but the market on No. 1 steel is not quotable at higher than $17 to $17.50. Dealers are offering scrap freely at the higher figure and, with no mills in the market, are not even getting counter offers at lower figures. It is reported that mills which took the bulk of the recent railroad lists were those which dealers had counted upon for purchases in the near future. One of them has now definitely withdrawn from the market. Compressed sheets are quotable at about the same level as heavy melting, although one dealer recently bought a fair-sized tonnage at $16.75, and the market at Detroit is said to be very weak. The lighter grades are unchanged, though a distress tonnage of borings was recently disposed of at $11.50. Dealers are paying $12.25 to cover old sales of this grade. Mill inspection is strict on all grades of steel and rejections are common at all points. Specialties are holding at recent levels, and steel foundries are taking shipments at a good rate. The blast furnace grades are quiet.

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.00 to $17.50
No. 2 heavy melting steel	15.00 to 15.50
Scrap rails	16.00 to 16.50
Compressed sheet steel	17.00 to 17.50
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels	15.50 to 16.00
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.00 to 12.50
No. 2 railroad wrought	17.00 to 17.50
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.50 to 21.00
Railr. coil and leaf springs	20.50 to 21.00
Rolled steel wheels	20.50 to 21.00
Low phos. billet and bloom ends	21.50 to 22.00
Low phos., mill plates	21.50 to 22.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	19.00 to 20.00

Chicago

Steel Sales Swelled By Specifications for Plates for Two West Coast Gas Lines

CHICAGO, Oct. 8.—Including specifications for plates for fabrication into pipe for West Coast gas lines, the week's business in steel in this market assumes formidable volume. Contracts for these gas lines, which went to the Milwaukee pipe fabricator, were announced a week ago. Local interests say that steel specifications are the largest for any week since last April. Ingot output has not been stepped up, however, remaining at a shade above 85 per cent.

A review of the character of business taken, and also that which is being passed on to the mills for rolling, reveals that rail tonnage plays only a minor part in the week's business. Farm machinery manufacturers are beginning to release steel tonnage for fall production schedules for equipment which must be ready for use in the spring.

Prices for plates, shapes and bars are holding moderately well at 2.05c. a lb., Chicago, though concessions of $1 a ton are more common now than a week ago. Rail mills, with old orders at hand in sufficient volume to support output at the current rate of 75 per cent of capacity to the end of the year, are now getting releases against recent purchases and production will be stepped up in the next week or 10 days.

Bids are being tabulated on the Santa Fe cars, which will require about 80,000 tons of steel, and contracts may be placed any day. The Southern has ordered 2000 cars from Eastern builders and among potential buyers are the Chicago & North Western, with 2000 box cars, and the Great Northern, with 1000 box cars.

Prices for wire and wire products are again giving ground in a market that is listless.

The local sheet market is active, with hot mill output at 90 per cent.

Ferroalloys.—Activity in this market is confined to occasional sales of carloads at prevailing prices. Shipments continue at a high level.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Pig Iron.—Announcements of advances in Southern iron are being made to become effective at the end of this week. Recent business in small lots has been taken at $13 a ton, Birmingham, and some quotations are still out at this figure. The new minimum will be $13.50 a ton, Birmingham. The Northern iron market remains firm in the immediate Chicago district. Competition, however, is growing keener in central Michigan, where Toledo producers are offering iron at $19, furnace. Iroquois furnace No. 3 was lighted Monday. All merchant stacks in this district are now in blast, and shipments, which have grown this week, are absorbing the full output. A cargo of low phosphorus pig iron from Europe is expected to arrive at Chicago about the middle of next week. It is reported that this iron has all been sold. Boat shipments of Lake Erie iron to Chicago aggregate close to 12,000 tons in the last five weeks. Fourth quarter contracting is near an end, but spot purchasing is active. Several malleable foundries find that railroad car work has taken up the slack which resulted from the letdown in automobile production.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	19.51 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Sheets.—Chicago district sheet mills continue to produce at 90 per cent of capacity and current specifications are ample to support this rate. Forward contracting is still far behind the volume normally on producers' books at this time of the year, but spot sales are unusually heavy and backlogs are undiminished. It is worthy of note that light manufacturers are finding business less brisk and, as a result, the demand for jobbing mill sizes of blue annealed sheets has fallen off sharply in the last 10 days. At the turn of September, local producers of heavy gage blue annealed sheets found themselves in a position where deliveries were as far ahead as 12 weeks and they were not desirous of adding tonnage to books. Makers of metal shelving, lockers and the light tanks are now using smaller quantities, and deliveries have dropped to the range of four to five weeks, though backlogs are still of the size that will support present mill rates for four to six weeks. Demand for galvanized sheets by the roofing trade is lighter this week, and deliveries, which now range from four to five weeks, give promise of shortening. Local mills are making promises of four weeks' deliveries on black sheets. The price situation is little changed from a week ago, except that quotations on black sheets have definitely settled to 2.95c. a lb., Gary, or 3c., delivered Chicago. Quotations on galvanized sheets remain steady at 3.65c. to 3.75c., Chicago, and No. 10 gage blue annealed sheets are quoted at 2.35c. a lb.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Inquiry for cast iron pipe is slower both from public and private buyers. The Central Foundry Co. has taken 225 tons of pipe for Bridgeman, Mich., and the United States Pipe & Foundry Co. has been awarded 15,000 ft. of 6 and 8-in. pipe by Sidney, Ohio. O'Fallon, Ill., expects to open bids Oct. 16 on 44,000 ft. of 8 or 10-in., 2500 ft. of 6-in. and 6000 ft. of 4-in. pipe. There is some doubt in the minds of sellers whether this contract will be placed in the near future; it is understood that financial matters have not been fully arranged. From scattered points throughout the Central West comes a fair volume of inquiry for lots of less than 100 tons each. Several Western railroads have placed orders for less than carloads. Prices remain steady at levels reached last week.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Rail and Track Supplies.—Chicago mills continue to produce at 75 per cent of capacity, but releases received this week against new orders will raise output in the next week or 10 days. This year, like 1928, has found local rail mills amply supplied with orders so that the seasonal shutdown, which usually comes late in the summer or in early fall, has not been experienced. The Chesapeake & Ohio is said to have placed 14,000 tons of track supplies with mills farther east. The local rail and track fastening market is quiet except in new inquiry, which is rapidly taking shape. The light rail market is quiet.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Hot-Rolled Strips. — Automobile frame manufacturers and makers of rims are entering fourth quarter contracts. Prices are steady. Shipments are in moderate volume.

Bars.—With soft steel bar mills operating between 80 and 85 per cent of capacity, deliveries continue to improve, now ranging between two and seven weeks, depending on the product. Demand from the automobile trade continues to taper, except from scattered plants where new models are now being brought out. Demand for forging bars reflects the curtailed output by automobile manufacturers. Shipments of steel to road machinery manufacturers are at a steady pace, but below the rate maintained in the first eight months of the year. Farm machinery builders are releasing more steel in conformity with schedules arranged for early spring shipment of equipment. Specifications for rail steel bars are fully equal to shipments, which represent double turn operations at Chicago mills. New buying, especially for forward needs, is more active and prices are holding at 1.95c. a lb., Chicago Heights. Orders for fence posts made from old rails are more numerous following the announcement early in the week that fall terms were in effect.

Structural Material. — Awards for the week, including 1000 tons for a hospital in Chicago, totaled slightly over 2500 tons. Fresh inquiry is less brisk than a week ago, and there are indications that engineers' and architects' offices are less busy. It is reported that the 1700 tons needed for the Fine Arts Building, Chicago, will not be purchased in a lump, but that the job will be detailed and steel purchased in small lots as needed. Bids are to go in next week on 5000 tons for the Union Traction Co.'s bridge at Indianapolis. Miscellaneous users of shapes are freely entering the market for fourth quarter requirements. Of special note is the fact that several fabricators have placed sizable orders for stock, a practice which has not been followed for many months.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Plates.—This market is without feature except for releases by the Milwaukee pipe maker. These are against new business. An oil producer in the Southwest has ordered 7000 tons of plates for oil tank construction. No new tank programs have come out this week, and outstanding inquiry for this kind of work is reduced to about 12,000 tons. Bids for the Santa Fe cars were submitted Oct. 1 and it is rather generally believed here that contracts for the cars will be placed in the very near future. Deliveries on narrow plates range from three to four weeks and on wide plates from five to eight weeks.

Wire Products.—Prices are not withstanding the test of competition. Common quotations on plain wire in the Chicago district are 2.40c. a lb., and wire nails are freely quoted at $2.45, base, per keg. Specifications from the manufacturing trade are steady, while some improvement is noted in the volume of wire and wire products moving to jobbers.

Reinforcing Bars.—Noteworthy in this week's business are two awards that aggregate 2200 tons. One of these is for a department store at Dubuque, Iowa, and the other for a store building in Chicago. Among fresh inquiries is 900 tons for a store and apartment building on Sixty-third Street, Chicago. A clearer price structure for reinforcing bars seems a step nearer. The rail steel commodity is being reasonably well held at 2c. a lb., warehouse. Efforts are being made to get higher prices for billet steel reinforcing bars, which normally sell for $6 a ton above rail steel bars. If this is accomplished, the minimum quotation on new billet reinforcing bars will be 2.30c. a lb., Chicago warehouse.

Warehouse Business.—Sales in September compared favorably with those in August and were measurably ahead of the ninth month a year ago. October, which is usually a good month from the viewpoint of business done by warehouses, is getting away to a good start.

Bolts, Nuts and Rivets.—Specifications continue to grow, but the rate is slow. Larger releases come for the most part from farm implement manufacturers, which are entering fall production schedules for equipment which must be ready for spring delivery. Output stands at 65 per cent of capacity and producers' stocks are well balanced.

Old Material.—The Chicago scrap iron and steel market is dull from the viewpoint of consumer purchases. Prices, though untested in recent days, are leaning toward the weak side. Heavy melting steel dropped last week to $15 a gross ton, delivered, and brokers immediately lowered their prices to $14.75 a ton, but upon finding that many were eager to ship at this price they quickly lowered their offers to $14.50. Dealers evidently find no strength in the market. Supplies are available for shipment against old orders even at the new low prices offered by brokers. Heavy melting steel is reaching consumers in more than ample tonnages, both for enlarging stocks and for immediate use, and, as a result, inspections have tightened and rejections are numerous. One large consumer, which recently refused to accept dealers' bundles, has again agreed to take this grade, but has made no gesture toward buying a tonnage. Rerolling rails, after lying dormant for some time, have jumped 75c. a ton to $17.85, Chicago, on a purchase of a round tonnage for delivery at Gary, Ind. The freight rate from Chicago to Gary is $1 a ton. Brokers are lowering their offering prices for cast iron borings, which a week ago they freely took at $10.50 to $10.75 a gross ton. Although output of borings is off in conformity with the lessened pace of the metal-working industry, there now is an oversupply of this grade, and dealers are offering $10.25 a gross ton for delivery against old orders. Taken as a whole, this market is listless. Sales to users of the heavy tonnage grades are at a standstill and melters of specialties will take scrap only in small lots for nearby use. The trade holds out no hopes for stronger prices in the near future, and there are those who look for further declines.

Warehouse Prices, f.o.b. Chicago

	Base per Lb

Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.75 to 11.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Algoma Bar Mills Shut Down For Rebuilding

SAULT STE. MARIE, ONT., Oct. 8.—Construction work in connection with the extension of the merchant mills of the Algoma Steel Corporation has resulted in the closing down of these mills. The 18-in. mill suspended Sept. 26 and the 12-in. mill on Oct. 1. Operations will be resumed about the first of the year, when the new mills will have been completed. The plant additions will represent an expenditure of $2,000,000 and will provide thoroughly modern equipment and double the capacity of the two mills.

Furnace at Milwaukee Being Dismantled

The Thomas furnace at Milwaukee is being dismantled. It was owned and operated by the Thomas Furnace Co., which was incorporated in Wisconsin in 1904. The furnace, with four stoves, was built in 1908. Its annual capacity was 110,000 tons.

New York

New Structural Steel Projects Call for 62,750 Tons—Pig Iron Demand is Fair

NEW YORK, Oct. 8.—Pig iron demand is in fair volume, considering the fact that fourth quarter contracting has been largely completed and little interest is being shown in first quarter needs. Sales of the week totaled about 9000 tons. The largest purchase was by the Worthington Pump & Machinery Corporation, which bought 1600 tons for various plants. Another buyer in this district closed for 1000 tons. The New York Central Railroad has bought 350 tons. In New England, the General Fire Extinguisher Co., Providence, R. I., placed orders for 1500 tons of foundry and malleable. The largest current inquiries call for 1200 tons and 1000 tons respectively. Total pending business actually before the trade is not large, but sellers continue to uncover considerable tonnage by thoroughly canvassing the market. Purchases to supplement previous orders are in encouraging volume. Suspensions of shipments are rare, and melt seems to be well maintained. Southern iron continues to be sold in this market, but is less of a factor than a few weeks ago. Alabama producers are quoting $13.50, base Birmingham, on foundry grade. Steel company offerings of surplus iron do not appear to have grown much larger, and prices both at Buffalo and eastern Pennsylvania furnaces are substantially unchanged. Repairs on the Port Henry, N. Y., furnace have been completed and drying out is now under way, with the blowing in of the stack on Oct. 15 assured. A threatened strike of towboat crews in New York harbor may result in some interference to barge shipments of pig iron.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Cast Iron Pipe.—Pressure pipe buying by most private companies and municipalities is limited to small lots for completion of installations. Prices continue irregular, on most business ranging from $33 to $34 a ton, f.o.b. Northern foundry, but occasionally this range is shaded to $32 a ton or less, f.o.b. foundry. The Pennsylvania Railroad has closed on 6000 ft. of 6-in. pipe for installation at West Philadelphia. Inquiries include 30,000 ft. of 8 and 10-in. water pipe for Buffalo, bids on which will be opened Oct. 10, and 125 tons of 6 and 12-in. pipe and five tons of fittings for Newburgh, N. Y., bids opening Oct. 10. An export inquiry for shipment to Porto Rico calls for 4200 ft. of 24-in. pipe, about 500 tons, with alternate prices asked on 4200 ft. of 20 in.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—Activities have been fairly well sustained in the past week. Carroll-McCreary Co., Inc., has booked two jobs requiring a total of 670 tons of bars. Bids have been taken on 2000 tons for grade crossing elimination work for the Long Island Railroad. Action is expected soon on 700 tons for two New York subway sections. The Pennsylvania is inquiring for 750 tons of bars for electrification work at New Brunswick, N. J. Prices are steady and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—Developments of the week in the local steel market have to do chiefly with prices. Black sheets have definitely settled to 2.75c., base Pittsburgh, for the larger buyers, though small buyers are still asked to pay 2.85c. Blue annealed sheets, both light and heavy, are also weaker. No. 10 gage is being offered to large buyers at 2.10c. and to small buyers at 2.20c.; the lower figure has been heard of occasionally in recent weeks, but has now become more general. No. 13 gage ranges from 2.25c. to 2.35c., Pittsburgh, the lower price applying on the more attractive lots. Light gage blue annealed sheets have until the past week or so been holding fairly well at 2.35c. Local steel sales offices are unable to discern any improvement in the volume of buying, but it is probable that demands have not decreased, being about the same as during the previous few weeks. In railroad equipment, the chief item of interest is the placing of 1500 steel gondola cars by the Southern Railway with the Pressed Steel Car Co. This road is expected to buy about 2500 more cars. New structural work in the New York area this week totals 62,750 tons, of which 18,000 tons is for three units of the New York Cornell Medical Hospital and 21,000 tons for a freight terminal for the Lehigh Valley Railroad. Lettings in September in the New York metropolitan district, exclusive of civil engineering work such as subways and bridges, totaled 54,119 tons, according to records of the Structural Steel Board of Trade of New York.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Warehouse Business.—Buying from stock has improved slightly, but blue annealed and galvanized sheet prices are still being shaded. Galvanized sheets are subject to concessions of about $2 a ton on desirable business. Blue annealed sheets, which are quoted by warehouses in this district at 3.90c. a lb., base, for No. 10 gage, have been sold at concessions down to 3.25c. to

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

3.35c. a lb., base. Demand for structural material and steel bars is improving, and prices are fairly well maintained.

Coke.—Prices are unchanged at $2.65 to $2.75 a net ton, Connellsville, for standard furnace. Special brands of beehive coke are quoted at $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—The trend of scrap prices continues downward. Consumers of No. 1 heavy melting steel are offering $15.50 a ton, delivered, although the most recent purchases of this grade were at $16 to $16.50 a ton, delivered. Machine shop turnings are quotable on a slightly lower basis as the result of recent buying by brokers at $11 to $11.25 a ton, delivered eastern Pennsylvania. Such items of railroad scrap as steel car axles, rerolling rails and malleable cast are off 50c. a ton on recent buying by brokers to fill contracts.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.00 to $12.85
Heavy melting steel (yard)	8.00 to 9.50
No. 1 hvy. breakable cast.	10.25 to 11.00
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.50 to 8.00
Short shoveling turnings..	7.50 to 8.00
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles.....	18.50 to 19.50
Iron car axles.....	23.00 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.25
Forge fire	9.50 to 10.00
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	12.75 to 13.25
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	13.50 to 14.00
Cast borings (chemical)..	9.50 to 10.00

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$16.00 to $16.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	14.00 to 14.50
No. 2 cast (radiators, cast boilers, etc.)	13.50 to 14.00

Cleveland

Automobile Manufacturers Buy Good-Sized Tonnages of Sheets, But Prices Are Definitely Lower

CLEVELAND, Oct. 8.—The volume of business in finished steel increased during the week, due to the placing of some good-sized lots of sheets by the automotive industry in the Detroit territory. This furnished a test of prices and indicated a buyers' rather than a sellers' market. Buying by the automobile companies for some time has been at a low ebb, and this spurt of activity does not indicate an early revival of this industry. Auto body sheets cannot be delivered for earlier than November production. A Cleveland body plant placed some tonnage in auto body sheets for parts of the new model Chevrolet bodies that have been approved by the engineering department.

Some of the automobile companies that will bring out new models evidently have reached the point where they are about ready to place orders for parts, as Cleveland makers of forgings and stampings have received considerable inquiry for car parts.

While there is little expectation that the automotive industry will show a gain in production this month, some pickup seems probable in November. Although the Ford Motor Co. announces an increase in its production schedule for October over September, this company's figures apparently indicate that its daily output this month will be somewhat less than in September.

The steel market in this territory shows little change, business holding at about the recently reduced volume. The outstanding feature in the price situation is a weakness in the sheet market, with reduced prices on auto body, black and blue annealed grades.

Pig Iron.—Sales gained the past week, during which Cleveland interests sold 32,400 tons of foundry iron. Not much inquiry is pending. Considerable of the business came from radiators, furnace and stove manufacturers, and very little from the motor car industry. Some of the consumers in the automotive field are buying from hand to mouth instead of for the full quarter, because of the uncertainty as to their requirements during the remainder of the year. Shipping orders are in about the same volume as last month. There apparently is no deviation from the regular quotations of $18.50, Cleveland furnace, for out-of-town shipment, $19, furnace, for local delivery and $20, furnace, for delivery in the Michigan territory. The recent inquiry of the Westinghouse Electric & Mfg. Co. for iron for its Cleveland plant is still pending. B furnace of Pickands, Mather & Co., Toledo, which has been out for relining, was blown in Oct. 3.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25...	$19.50 to 20.00
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Ore is moving at a good rate, and it is expected that October shipments will be 8,000,000 tons and that 4,000,000 tons will be moved in November. These would make a total water movement of slightly over 65,000,000 tons this year, breaking the previous record of 1916, when water shipments amounted to 64,734,198 tons. Water shipments until Oct. 1 were 53,264,827 tons, breaking the previous record in 1916 of 48,816,650 tons. Final figures for September showed a movement during the month of 9,547,040 tons. Shipments until Oct. 1 were 11,998,848 tons over the corresponding period last year, or a gain of 29.08 per cent.

The balance of ore on docks at Lake Erie ports Oct. 1 was 5,765,204 tons, compared with 6,100,456 tons on the same date a year ago.

Semi-Finished Steel.—While demand for sheet bars has become spotty, specifications are holding up well, suspensions by some consumers being offset by the releases by others. Weakness in sheet prices has been followed by some effort to secure concessions from the $35 price on sheet bars. Most consumers are under contract at that price.

Bars, Plates and Shapes.—Weakness in other districts has led to some pressure by buyers for price concessions, but outside mills that have closed a good many contracts at 1.95c., Cleveland, for steel bars and at 1.95c., Pittsburgh, for plates and shapes have refused to revise their contracts. The local mill price range of 1.90c. to 1.95c. on steel bars that has prevailed for some time is unchanged. Steel bar business is light owing to the decreased demand from the automotive industry, especially from makers of low-priced cars. A local mill has closed contracts with miscellaneous users of plates at 1.95c., Pittsburgh. The structural market is quiet. The Bethlehem Steel Co. will furnish 1200 tons of sheet steel piling for the Detroit water works.

Sheets.—Some round lot business was placed by the automotive industry in the Detroit territory the past week, making the volume of business considerably larger than during any previous week for some time. Locally, there was a little gain in business. Pressure by buyers at a time when mills need business resulted in a reduction on auto body sheets and in some sharp price concessions on round lots of blue annealed sheets. Auto body sheets, which had recently been wavering, were reduced $2 a ton to 4c., Pittsburgh. However, several mills with the hope of getting prices up

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes.....	3.00c.

No. 9 gal. wire, per 100 lb.....	3.25
Com. wire nails, base per keg.....	2.80

*Net base, including boxing and cutting to length.

again for the first quarter are stipulating that specifications at this price must be in by Nov. 1. As about four weeks is required for manufacturing auto body sheets, buyers evidently will have their requirements well taken care of for the fourth quarter at 4c. Continuous mills have gone as low as 2c. for light blue annealed plates and 2.15c. for No. 13 blue annealed in the Detroit territory. However, the more common quotations on round lots appear to be 2.10c. and 2.25c. respectively for the two grades. Jobbing mills are not meeting the concessions. Black sheets have settled to 2.75c. as a common quotation. Galvanized sheets appear to be holding fairly well at 3.50c., Pittsburgh, although that has also been named as a Valley base.

Wire Products.—Wire is moving fairly well, but nails continue dull. On nails, $2.45, Cleveland, is the ruling price for car lots in this territory. Wire appears firm at 2.40c.

Track Supplies.—The Chesapeake & Ohio Railroad has placed 8000 tons of tie plates with the Wheeling Steel Corporation.

Strip Steel.—Mills are getting some hot-rolled strip business, but not enough to keep them in full operation. While there is considerable pressure for price concessions, regular quotations appear to be holding remarkably well. Demand for cold-rolled strip is slow. There appears to be no concession from the regular 2.75c., Cleveland, price and mills are still able to get 2.85c. for small lots.

Bolts, Nuts and Rivets.—Demand for bolts and nuts is still rather light, the volume of business showing no gain over that of last month. The industry is operating at 60 to 65 per cent of capacity. Prices are firm. Rivets are moving somewhat better than last month. Most buyers have signed contracts at the regular $3.10 per 100 lb. price for large rivets, which is holding for the regular run of business. However, a 1100-ton lot placed by an Eastern shipbuilding company is understood to have gone at slightly under $3 per 100 lb.

Coke.—Foundry coke is slow. By-product domestic coke is in good demand and firm. Foundry coke prices are unchanged at $8.25, ovens, for Ohio by-product coke and $4.85, ovens, for the better grades of Connellsville coke.

Old Material.—The market on steel making scrap is 25c. a ton lower, but blast furnace grades are firmer, following the purchase of a round tonnage of borings and turnings by a local mill at a reported price of $12. Dealers are paying $11.25 to $11.50 for scrap against these new orders, or an advance of $1 a ton. The purchase did not include No. 2 busheling, which advanced only 25c. No. 1 heavy melting steel is not bringing over $15.25 from dealers for the grades used by one Cleveland consumer, but for selected scrap for another Cleveland mill dealers are paying $16.75.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$14.75 to $15.25
No. 2 heavy melting steel	14.25 to 14.75
Compressed sheet steel	14.75 to 15.25
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.50
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.75 to 11.25
Mixed borings and short turnings	10.75 to 11.25
No. 2 busheling	10.75 to 11.25
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.50 to 19.00
Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Steel Bar Contracts Being Reduced $1 a Ton—Shape Market Shows Weakness

PHILADELPHIA, Oct. 8.—Consumers of steel in this district are maintaining fair operations, but are not inclined to cover their future requirements to any extent. Builders of commercial car bodies are better engaged than the fabricators of passenger cars. Of the latter, however, one plant expects to increase output soon, when production begins on the new models of two leading motor cars. Steel bar contracts are being written down $1 a ton and most of the new business being placed for bars is at 1.90c., Pittsburgh.

Bars.—Contracts are in most cases being revised downward $1 a ton to 1.90c. a lb., Pittsburgh, or 2.22c., delivered Philadelphia. Although the former price of 1.95c., Pittsburgh, or 2.27c., Philadelphia, is still quoted on small lots, business of a carload or more is generally at the new level. Operating rates of mills are still curtailed in the absence of automotive activity.

Pig Iron.—Users of foundry iron are buying for immediate requirements, but show no inclination as a rule to contract for delivery over the rest of the year. Southern competition is still encountered in this district, but is of lessening importance, with Birmingham furnaces endeavoring to maintain $13.50 a ton, furnace, as a minimum quotation for foundry iron. Low phosphorus demand is small, but bids will be opened Oct. 11 on 100 tons for the Panama Canal Commission. No sizable purchase of basic iron has been made by consumers in this district for some weeks, but two of the leading users of this grade are expected to inquire shortly for their requirements to the end of the year.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Reinforcing Bars.—Distributers of billet steel bars are quoting from 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, usually with no extra for cutting to required length. As a result, sellers of rail steel bars have found it necessary to offer concessions of $2 a ton and more from 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length. A recent sizable contract for bars has been awarded to a rail steel mill, 650 tons of bars for a building at Kearny, N. J., for the Western Electric Co., having been placed with the Danville Structural Steel Co.

Shapes.—Fabricating shops are well engaged, but the tonnage of prospective business is small. Shape prices are still irregular and lacking in strength. Quotations range from 1.90c., f.o.b. nearest mill to consumer, or 1.96c., Philadelphia, to 2c., mill, or 2.06c., Philadelphia.

Plates.—Operations are still at a good rate, with some mills rolling plates for shipbuilding and railroads and others completing old contracts for tank material, especially for the oil industry. New business is scattered and small. The price is un-

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ¾-in.	2.90c.

Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

changed at 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Sheets.—A builder of commercial car bodies in this district is maintaining a slightly better rate of operation than the passenger car body fabricators. One local plant, however, expects to increase its scale of operations materially in the next few weeks, when production begins on the new models of two leading motor car builders, with which it has contracts. Black sheets have rather generally settled to 2.75c., Pittsburgh, or 3.07c., delivered Philadelphia, and galvanized sheets are quoted at 3.50c., Pittsburgh, or 3.82c., delivered Philadelphia. Blue annealed sheets continue in fairly active demand and mills are able to maintain higher operating rates on this grade than on either black or galvanized. Quotations are 2.35c. a lb., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage and lighter and 2.20c., Pittsburgh, or 2.52c., Philadelphia, for No. 10 gage, blue annealed plates. On contracts with large consumers, or when competition is encountered from continuous sheets, these quotations are usually shaded $2 a ton to 2.25c., Pittsburgh, for No. 13 gage and 2.10c., Pittsburgh, for No. 10 gage blue annealed plates.

Old Material.—All grades of scrap show a tendency to weakness on the basis of dealers' offers to buy on current contracts. Most consumers are well covered in their scrap requirements at present and are not offering to buy additional tonnage, except at concessions of 50c. a ton or more from the prices they have previously paid.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.00 to $16.50
Scrap T rails	15.50
No. 2 heavy melting steel	12.50 to 14.25
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	14.50 to 14.75
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Imports.—In the week ended Oct. 5, 3274 tons of chrome ore arrived at this port, of which 2918 tons was from Cuba and 356 tons from Portuguese Africa. Iron ore arrivals consisted of 697 tons from Spain. Pig iron imports were 1203 tons from India. A hundred tons of spiegeleisen was received from the United Kingdom. Steel imports consisted of 76 tons of steel bars from Belgium, 55 tons from France and 21 tons from Germany, 24 tons of steel bands from France and 5 tons from Belgium, 207 tons of structural shapes from Belgium and 102 tons from France, 65 tons of steel billets from Sweden and 10 tons of steel scrap from the United Kingdom.

Detroit

Automobile Situation Still Uncertain

DETROIT, Oct. 8.—The automobile situation is still uncertain, but indications point to some improvement, as affecting demands for steel, by November.

Automobile manufacturers generally are using up their inventories, as model changes impend. There may be a further drop in steel orders before specifications are sent to the steel mills for the production of new models.

Despite denials by the Ford Motor Co. that it will bring out a slightly changed model in November, the opinion persists here that some alterations are in progress. The Ford plant is now operating five days a week on a daily schedule of about 7000 cars.

Chevrolet production is about 3500 cars a day. Its production schedule for November and December is said to call for 65,000 cars a month.

The Buick plant at Flint is producing about 1200 cars a day, 150 of which are the Marquette model. The November schedule is on the same basis.

The Chrysler Corporation, including the Dodge plant, Hudson-Essex, Graham-Paige, Hupp and Willys-Overland, are not operating much, if any, above 50 per cent of capacity. Pontiac, Oakland and Olds plants are about on the same basis.

The Packard and Cadillac plants, both of which have recently introduced new models, are running virtually at full capacity.

Detroit Scrap Unchanged

DETROIT, Oct. 8.—There have been no changes in prices on old material in the district. Small sales are being made at the lower side of the range. With curtailed automotive production, current orders are sufficient to cover scrap being produced.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	8.50 to 9.00
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.00 to 12.50
Old No. 1 busheling	10.50 to 11.00
Sheet clippings	8.25 to 8.75
Flashings	12.50 to 13.00

Reinforcing Steel

Lettings Amount to 4600 Tons—New Work Totals 5000 Tons

REINFORCING steel awards the past week totaled 4600 tons, of which 2000 tons will be required for a bridge at Pensacola, Fla. Over 5000 tons was added to the pending list. Two thousand tons will go into grade elimination work on the Long Island Railroad and 900 tons into an apartment and store building at Chicago. Awards follow:

BOSTON, 150 tons, Congress Street bridge, to Joseph T. Ryerson & Son, Inc.

NEW YORK, 375 tons, Farmers' Loan & Trust Co. Building, to Kalman Steel Co.

NEW YORK, 300 tons, section 6, route 107, of subway, to Carroll & McCreary.

NEW YORK, 250 tons, New York Cornell Hospital, to Carroll & McCreary.

NEW YORK, 120 tons, telephone building, to Carroll & McCreary.

PENSACOLA, FLA., 2000 tons, Pensacola Bay bridge, to Concrete Steel Co., Birmingham.

CHICAGO, 1100 tons, Roshek store, to Concrete Engineering Co.

CHICAGO, tonnage not stated, apartment building on Wilson Avenue, to Kalman Steel Co.

CHICAGO, 215 tons, St. Elizabeth's Hospital, to Concrete Engineering Co.

CHICAGO, 350 tons, addition to Michael Reese Hospital, to an unnamed bidder.

CHICAGO, 100 tons, Bethany Hospital, to Olney J. Dean & Co.

DUBUQUE, IOWA, 1100 tons, department store, to Concrete Engineering Co.; previously reported to an unnamed bidder.

ST. LOUIS, 100 tons, building for Krey Packing Co., to Laclede Steel Co.

KEARNY, N. J., 650 tons, buildings for Western Electric Co., to Danville Structural Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

LONG ISLAND RAILROAD, 2000 tons, grade crossing elimination work.

PENNSYLVANIA RAILROAD, 750 tons, electrification work at New Brunswick, N. J.

CLEVELAND, 275 tons, film exchange building for Warner Brothers.

CHICAGO, 100 tons, warehouse for Norton Co.

CHICAGO, 100 tons, factory for Borg & Beck Co.

CHICAGO, 350 tons, Parker Public High School.

CHICAGO, 900 tons, Wieboldt apartment building and store on Sixty-third Street.

SEATTLE, 200 tons, Fourteenth Avenue South bridge; bids Oct. 21.

SEATTLE, 363 tons, approach to West Spokane Street bridge; bids Oct. 11.

Bliss & Laughlin, Inc., has appointed Denyven, Linn Co., 250 Stuart Street, Boston, as sales representatives for its cold-drawn steel and shafting in the New England States. In the New York metropolitan district sales have been put in charge of John Harvey Bryan, 50 Church Street. Expansion of the sales organization is due to increased business resulting from the establishment of the company's Buffalo plant.

Birmingham

Pig Iron Shipments Continue to Exceed Output—New Steel Business at a Good Rate

BIRMINGHAM, Oct. 8.—Pig iron buying is now being spread out more evenly from week to week. Though the volume is below the average of three or four weeks ago, it is considered fair. More iron is being sold and considerably more is under contract than in the corresponding period in the preceding quarter. Inquiries continue to develop, but more of the sales are the result of quiet negotiations. Small orders for prompt delivery are more frequent than they have been in some time. Sales to outside points, which have declined in the past two or three weeks, are expected to improve with the beginning of first quarter buying. The margin of shipments over output is undiminished. The district price of $14.50 remains firm, and concessions from this price in the competitive territories are confined to large orders. The No. 4 Bessemer furnace of the Tennessee company, which had been banked since Aug. 18, was placed in operation Oct. 1 on recarburizing iron. The Tennessee company has also changed its Ensley furnaces Nos. 1 and 3 from foundry to basic iron. The No. 1 furnace of the Republic Iron & Steel Co. is to be blown in about Oct. 10. Of the 14 active furnaces, six are on foundry iron, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15 00
Basic	14.50

Finished Steel.—New business is coming in at a rate approaching that of the best buying periods. Structural shapes, bars, plates and sheets are the most active items. Railroad accessory demand has improved. Oct. 14 has been set as the date for reopening the Ensley rail mill. Stocks will be built up for the fall buying period. Bookings in both structural steel and reinforcing bars improved last week. The Virginia Bridge & Iron Co. received an order for 500 tons for the Buckeye cotton oil plant at Memphis. New orders of the Ingalls Iron Works Co. include 350 tons for the Nichols Copper Co. El Paso, Tex.: 170 tons for a school at Greenville, Miss., and 100 tons for a school at Booneville, Miss. The Concrete Steel Co. will furnish 2000 tons of reinforcing steel for the Pensacola Bay bridge at Pensacola, Fla. The Tennessee company is now operating five open-hearths at Ensley, an increase of one, making a total of 18 active in the district.

Cast Iron Pipe.—New business is lighter than last week. Pressure pipe manufacturers are not hopeful of much improvement in the market before the winter buying period for spring requirements. This buying is not expected to be up to the average of past years owing to the unsatisfactory market for bonds of Southern municipalities. Good shipments during the past several weeks brought some reduction in stocks. Prices remain steady at $37 to $38 a net ton, Birmingham.

Coke.—The movement of foundry coke on contracts continues steady and in fair volume for season. Prices remain at $5 a net ton, Birmingham.

Old Material.—Steel grades are holding up fairly well, though the volume of sales does not compare favorably with that of this time last year. Iron scrap continues inactive. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Pacific Coast

Activity in Steel Moderates, but Fabricating Shops Are Well Filled with Tonnage

SAN FRANCISCO, Oct. 5 (*By Air Mail*).—Demand for iron and steel products on the Pacific Coast this week fell off to some extent. The Pacific Northwest has had a number of important projects up for figures during the past month or two, and most of the fabricating shops have enough business booked to keep them busy for three months or more. Outstanding awards included 405 tons for a bridge over the Trinity River and new projects include 2400 tons for a viaduct in Tacoma. The price structure is holding fairly well, but some weakness in plates is in evidence.

Pig Iron.—During the past six weeks nearly 5000 tons of foreign pig iron has arrived on the Pacific Coast to fill contracts placed some time ago. A shipment of special Indian iron, approximating 1500 tons, is scheduled to arrive about Oct. 20. It is understood that this iron will be used in the manufacture of sanitary ware. Jobbing plants continue to operate on limited schedules, and little improvement is looked for during the next 30 days. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing steel bars were confined to lots ranging from 30 to 80 tons. Pending business, however, calls for more than 4500 tons, most of which, it is expected, will be closed within the next two weeks. Bids will be opened Oct. 11 on 363 tons for approaches for the West Spokane Street bridge, Seattle, and on Oct. 21 for 200 tons for the Fourteenth Avenue South bridge, Seattle. Out-of-stock prices in Los Angeles continue firm at 2.40c., base, on carload lots and at 2.70c. on smaller tonnages, while San Francisco district quotations are $2 a ton higher. Merchant bar steel is firm at 2.35c., with demand limited to unimportant tonnages.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¾-in. and over	3.15c.
Small angles, under ¾-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Plates.—Little of importance occurred in the plate market this week, business booked being confined to small lots. Only one project involving more than 100 tons of material is before plate fabricators for figures. This calls for 140 tons for two siphons at La Mesa, Cal., bids on which will be opened Oct. 7. The general quotation on plates continues at 2.35c., c.i.f., but this price is being shaded on desirable lots.

Shapes.—The structural shape market is active, some good-sized tonnages having recently come into the market. In addition to 2400 tons for a viaduct in Tacoma, mentioned above, on which bids will be opened Oct. 21, the city of Seattle is calling for bids, on the same date, on 1000 tons for the Fourteenth Avenue South bridge. The California Packing Corporation, San Francisco, is taking bids on two canning plants, one in Togoloan, P. I., and the other in Tahiti, involving 500 tons and 350 tons respectively. Awards included 405 tons for a bridge over the Trinity River, taken by the United States Steel Products Co.; 100 tons for a hangar at Albuquerque, N. M., placed with the Minneapolis Steel & Machinery Co., and 225 tons for an apartment at Pacific and Laguna Streets, San Francisco, secured by the Golden Gate Iron Works. Plain material remains firm at 2.35c., c.i.f. Coast ports.

Cast Iron Pipe.—Demand for cast iron pipe is beginning to show signs of improvement and pending business now exceeds 7000 tons. San Diego placed with an unnamed interest 460

tons of 4 to 8-in. Class B pipe for Chesterton Street. The Weyerhaeuser Timber Co., Klamath Falls, Ore., awarded 750 tons of 6 to 10-in. Class 150 pipe to the American Cast Iron Pipe Co. San Diego will open bids on Oct. 21 for 112 tons of 4 to 8-in. Class B pipe for Estelle Street. The United States Pipe & Foundry Co. was low bidder on 138 tons of 4-in. Class 150 pipe for Pleasanton, Cal., and on 5585 tons of 4 to 12-in. Class B pipe for Long Beach, Cal.

Steel Pipe.—Standard steel pipe continues to move well, due to building construction activity, which is holding up well. The Standard Pipe & Supply Co., Los Angeles, took 305 tons of 2 to 8-in. standard pipe for Long Beach, Cal.

St. Louis

Basic Pig Iron Purchases Total 24,000 Tons—Plate Mill Operations Expand—Scrap Weak

ST. LOUIS, Oct. 8.—Two large purchases of basic iron, one of 18,000 tons and the other 6000 tons, both by East Side melters for shipment during the remainder of the year from the St. Louis Gas & Coke Corporation featured an otherwise quiet week in the pig iron market. The local maker also sold 150 tons of malleable to one implement manufacturer, 250 tons of foundry iron to another and 1865 tons of foundry grades in lots of from a carload up to 100 tons. The company's shipments during September totaled 35,000 tons, the second largest month in its history, and sales were 42,000 tons, the largest for any month since October, 1928. Sales of Southern iron were light. The market is quite firm on both Northern and Southern make. Jobbing foundries catering to the electrical industry report business is light, while the melt of foundries handling stove castings has increased materially. There has been some inquiry for prices on pig iron for shipment during the first quarter of 1930, one melter seeking 1000 tons. The local maker is accepting orders for next quarter shipment at present prices.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-fin. rounds, shaftings, screw stock	3.75c.
Black sheets (No. 24)	4.25c.
Galv. sheets (No. 24)	5.10c.
Blue ann'l'd sheets (No. 10)	3.45c.
Black corrug. sheets (No. 24)	4.30c.
Galv. corrug. sheets	5.15c.
Structural rivets	3.95c.
Boiler rivets	3.95c.
	Per Cent Off List
Tank rivets, ¾-in. and smaller, 100 lb. or more	65
Less than 100 lb.	60
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, sq., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

Finished Iron and Steel.—The plate department of the Granite City Steel Co., the only department operative recently at less than capacity, began operating on this basis during the last week. The volume of business in galvanized sheets is exceedingly large, demand being greater than the company's ability to produce. Specifications for tin plate are smaller, a normal condition for this time of year, bookings for fourth quarter being only fair. Business with structural steel fabricators is dull.

Coke.—The demand for domestic grades of coke is heavy, and shipments exceed production of by-product ovens in the district. There is said to be a scarcity of foundry grades, and the movement of furnace coke to the smelters in the district is heavy.

Old Material.—The market for old material is weak, No. 1 heavy melting steel being off 50c. a ton, while No. 2 is 25c. down. Miscellaneous rails, bundled sheets, No. 2 railroad wrought, rails for rolling and stove plate also declined 50c., and railroad springs went off 25c. Mills in the district suddenly shut off buying, declaring their order files did not justify further commitments. Shipments from the country dealers are considerably reduced because of low prices. Railroad lists: Pennsylvania Railroad, 58,220 tons; Baltimore & Ohio, 22,940 tons; Wabash, 3250 tons; Ann Arbor, 320 tons; St. Louis-San Francisco, 35 carloads; Nickel Plate, Chicago Belt Line and Nashville, Chattanooga & St. Louis, 15 carloads each.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.50 to $14.00
No. 2 heavy melting or shoveling steel	13.00 to 13.50
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand-sec. rails including frogs, switches and guards, cut apart	15.50 to 16.00
Railroad springs	17.75 to 17.85
Bundled sheets	10 00 to 10.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	16.00 to 16.50
Machine shop turnings	7.50 to 8.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	12.25 to 12.75
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Cincinnati

Southern Iron Prices Slightly Firmer—Inquiry for 15,000 to 20,000 Tons of Basic—Scrap Market Weaker

CINCINNATI, Oct. 8.—Although general inquiries were lacking last week, district furnace representatives sold approximately 7200 tons of pig iron, of which about 2000 tons was Southern, 300 tons was silvery and the remainder was Northern iron. Buyers in this district are not making general inquiries in as great number as heretofore, but are placing their orders after quiet inquiry is sent to one or two furnaces. The largest tonnage in last week's business came from a Dayton, Ohio, consumer, which took 1000 tons of Northern foundry iron. A Zanesville, Ohio, consumer placed an order with a Northern furnace for 500 tons, and a Southern buyer took 600 tons of Northern iron to cover its needs for the remainder of the year. The rest of the business was in small lots, ranging from one car to 100 tons. Further strengthening of the Southern market was noted in reports that the lowest purchasing price of this iron in last week's business was $14, base Birmingham. The only inquiry before the trade is for 15,000 to 20,000 tons of basic iron for fourth quarter use.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex.	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb.	8.75
	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.00
4-in.	33.00
Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

Finished Material.—Although new tonnage placed with district sheet mills last week was not quite equal to capacity, the new business volume was greater than that of the preceding week and indicated a strengthening in the demand. Because of reduced schedules of operation, backlogs were increased. Accordingly, with a fairly large unrolled tonnage on the books, mill operations next week will be increased to about 95 per cent. While activity in sheets has been fairly brisk, cold-rolled strip has been sluggish. The leading interest in this district reports that this unit has been operating at less than 50 per cent, but that the current inquiry indicates early improvement and an increase in operating schedules. Auto body sheets are down to 4.10c., base Pittsburgh. Although a number of large building operations have been announced, district steel fabricators do not expect much improvement in conditions before the first of next year.

Coke.—Specifications for by-product foundry coke are sustained at about the September level, which was noticeably less than the level set in August. Domestic grades are showing better activity with the approach of cooler weather.

Old Material.—While the mills are accepting shipments of old materials on contract, new business is very light, and dealers are still feeling the reluctance of mills to pay higher prices for scrap. Accordingly, the spread on heavy melting steel, No. 2 wrought and cast iron borings has been narrowed to 25c. The Southern Railway, the Chesapeake & Ohio and the Louisville & Nashville are offering their usual lists.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.50 to $13.75
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.00 to 9.25
Machine shop turnings	8.25 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.50 to 13.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Boston

Pig Iron Prices Still Unsettled—Alabama Competition a Factor—Scrap Market Weaker

BOSTON, Oct. 8.—The purchase of 1500 tons of four grades including malleable by the General Fire Extinguisher Co., Providence, R. I., featured an otherwise rather quiet pig iron market the past week. The bulk of the 1500 tons was placed with Buffalo district furnaces. In addition, the company bought a tonnage of Southern iron. The activity of Alabama iron in this market is still an unsettling price factor. While Alabama furnaces openly quote $14.50 a ton, base furnace, there has been no established base, price depending to a large extent on the desirability of the tonnage involved. The Mystic Iron Works, in various instances, has not tried to meet the Alabama price but has not held to its former price level. Prices on Buffalo iron also have been shaded when tonnages were attractive. The Universal Winding Co., Providence, R. I., is feeling out the market on a round tonnage of iron, and a Springfield, Mass., foundry intimates it will purchase 400 tons shortly.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Fabricated Steel.—Awards of 1500 tons of steel for a second Harvard Business School unit at Cambridge and of 700 tons for a pipe foundry to be erected by the Warren Foundry & Pipe Co. at Everett, Mass., were the largest here the past week. Approximately 5000 tons for bridges, municipal and manufacturing buildings is pending, and may be closed this month. In addition, some good-sized tonnages are reported as in the making.

Reinforcing Bars.—Aside from 150 tons for the Congress Street bridge, Boston, awards of billet steel bars the past week were in small tonnages, which in the aggregate made a fairly good showing. Several good-sized jobs are still pending. The market is steady at 2.66½c. a lb., base, from stock. The rail steel bar market is quiet at 2.26½c. a lb., base, delivered common Boston freight rate points.

Coke.—September deliveries of by-product foundry coke by New England ovens fell quite a little short of those in August. Shipments so far this month have run just about even with those of September. The price remains at $11 a ton, delivered within a $3.10 freight rate zone. Demand for domestic coke is again quite active.

Cast Iron Pipe.—Providence, R. I., has awarded 250 tons of 12-in. pipe to the United States Pipe & Foundry Co. Southboro, Mass., is about to close on pipe required for a two-and-a-half-mile, 6 and 10-in. line; Putnam, Conn., has completed plans for a one-and-a-half-mile pipe line requiring 6, 8, 12 and 16-in. dimensions, and Webster, Me., also has completed plans for a tonnage of pipe. Prices quoted openly on domestic pipe are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.60. A $4 differential is asked on Class A and gas pipe. Foreign pipe is offered at prices a shade under the domestic prices.

Old Material.—Business in most kinds of old material is confined to scattered car lots. Prices have fallen to a level where few brokers and manufacturers will sell, and important Pennsylvania steel mills apparently have sufficient scrap for current needs. The local export market is moderately active, and shipments to Danzig probably will be announced shortly.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$10.50 to $11.00
Scrap T rails	10.50 to 11.00
Scrap girder rails	9.50 to 10.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	7.00 to 7.25
Cast iron borings (steel works and rolling mill)	6.50 to 6.75
Bundled skeleton, long	9.00 to 9.50
Forge flashings	9.50 to 10.00
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.75 to 9.00
Shafting	13.50 to 14.00
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.50 to 10.00
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.50 to 10.00
Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

The Bethlehem Steel Co. will install four steam generators to burn blast furnace gas in a completely water-cooled furnace. The boilers will be built by the Combustion Engineering Corporation, New York.

Buffalo

Steel Mill Operations Decline to 70 to 75 Per Cent—Chicago Melter Seeks 10,000 Tons of Basic Iron

BUFFALO, Oct. 8.—The pig iron market remains quiet. A Chicago melter requires 10,000 tons of basic, but there seems to be little possibility that this business will come to a furnace in this territory. The General Fire Extinguisher Co. has bought about 1000 tons of foundry. There are a few 200-and 300-ton inquiries for foundry and malleable. One order was placed for 300 to 400 tons of foundry. Shipments of iron have been very good and most of the local furnaces are maintaining a minimum all-rail price of $18 on Eastern business, though the differentials are not being adhered to. So far no books have been opened for the first quarter. The district price of $19.50 base is firm.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—Operations of the Buffalo mills have dropped to about 70 to 75 per cent. The Lackawanna plant of the Bethlemen Steel Co. is operating 19 of its 24 open hearths, with about half of its mills on single turn. Sheet mill operation has fallen to 75 to 80 per cent. Declining demand for automobile sheets has made this reduction necessary. Construction of the new building for the Buffalo *Courier-Express* requires 800 tons of fabricated structural, which has been awarded, and the New York Central has awarded a contract for 200 tons of structural steel for a grade crossing elimination at Rome, N. Y. The *Courier-Express* building also requires 240 tons of reinforcing bars, which has been placed.

Old Material.—An unsettled condition prevails, with none of the mills actively buying. The entire list has weakened. Malleable plants are busy and have been absorbing most of the available malleable scrap. The last reported sale was at $19. Small sales of shoveling turnings at $11.50, Niagara Falls, have been made. No. 1 heavy melting steel has sustained a nominal weakening without any sales being reported. This scrap is now worth about $16.75 to $17.00.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

A mill which had been buying cast iron borings at a high price is understood to have reduced this, and dealers are now paying no more than $11 for this grade of material.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$16.75 to $17.00
No. 2 heavy melting steel	14.25 to 14.75
Scrap rails	16.00 to 16.50
Hydraul. comp. sheets	14.25 to 14.50
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.75 to 16.00
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	18.00 to 18.50
Coil and leaf springs	18.00 to 18.50
Rolled steel wheels	18.00 to 18.50
Low phos. billet and bloom ends	19.00 to 19.50
Electric Furnace Grades:	
Short shov. steel turnings	12.50 to 13.00
Blast Furnace Grades:	
Short mixed borings and turnings	11.50 to 12.25
Cast iron borings	11.50 to 12.25
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	15.50 to 16.00
Stove plate	12.75 to 13.00
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Canada

Pig Iron Producers Have Large Backlogs

TORONTO, ONT., Oct. 8.—While the demand for merchant pig iron in the Canadian markets is holding at a satisfactory level and shows general improvement over that of a year ago, forward delivery booking is beginning to fall off. About 80 per cent of those who place quarterly contracts have covered to the end of the year and local blast furnace representatives point out that last quarter contracts compare favorably with those for any other quarter this year. Producers are carrying large backlogs and are assured of heavy shipments during the next three months. Prices are unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—Although there is a falling off in new business, sufficient orders are appearing to maintain heavy shipments of structural steel in the various districts of Canada. Fabricating shops are carrying extensive orders, some of which call for delivery as far as a year ahead. Current demand runs mostly to small tonnages, but several prospective orders total as high as 5000 tons each.

Old Material.—According to local dealers, business done in the first three quarters of this year was the best since the war and there are good prospects that it will continue at its high average to the end of the year. Future delivery contract placing was negligible during the week, and spot sales also fell into a slump. Inquiries, however, indicate a large volume of new business in the early future. Scrap prices are without change.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel borings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	15.00	20.00
Axles, wrought iron	17.00	22.00
No. 1 machinery cast	....	17.00

No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

Youngstown

Steel Production in Valleys Declines

YOUNGSTOWN, Oct. 8.—Average steel production in the Mahoning and Shenango Valleys drops this week to 75 per cent, against the 90 per cent rate maintained during the first eight months.

This week 35 open-hearth furnaces are being operated by the independents, against 38 last week and 41 the week before that. Of 120 independent sheet mills, 86 are active.

The Youngstown Sheet & Tube Co. and the Republic Iron & Steel Co. report average operations of 75 per cent. The Warren plant of the Republic company is operating at the lowest level of the year. The Carnegie Steel Co. is maintaining production at 80 per cent, while the Sharon Steel Hoop Co. is at 90 per cent. For the first time this year, the Newton Steel Co.'s rate of production has declined to 80 per cent.

However, Valley steel makers are hopeful that Ford Motor Co.'s requirements will shortly expand and that other automobile interests will also enlarge their orders.

Prospects are that new steel business and production will be irregular over the remainder of the year.

Central Alloy and Interstate to Merge

Acquisition of Chicago Company Will Create New Steel Unit with Nearly 2,000,000 Tons Capacity

THE Interstate Iron & Steel Co., Chicago, will be merged with the Central Alloy Steel Corporation, Massillon, Ohio, which has purchased the entire property, assets and business of the Chicago company. Announcement of the acquisition of the Chicago plant was made Monday by F. J. Griffiths, chairman of the board of the Central Alloy Steel Corporation.

PAUL LLEWELLYN, president, Interstate Iron & Steel Co., Chicago, which is to be merged with the Central Alloy Steel Corporation.

This merger brings under one organization two of the leading manufacturers of alloy steels in the country. The ingot capacity of Central Alloy, now 1,542,000 tons a year, will be increased to 1,938,000 tons by the addition of the Chicago plant, which has an ingot capacity of 396,000 tons. The acquisition of the Interstate properties will add approximately $17,000,000 to the assets of Central Alloy Corporation, making a total of more than $92,000,000.

Central Alloy is the country's largest producer of alloy steels. The plants of the Interstate company are well adapted to the production of alloy steel and the addition of its facilities is expected greatly to strengthen the market position of Central Alloy in the Chicago district, particularly with reference to corrosion resisting alloys.

As a result of the acquisition, Central Alloy Toncan iron will be more readily available to Western consumers and a Western distributing point will also be provided for Enduro Nirosta, the recently introduced Krupp stainless material.

The Interstate Iron & Steel Co. was incorporated in 1895 and has three plants in the Chicago district. Paul Llewellyn, son of the founder of the company, is president and general manager. In addition to alloy steels for the automotive industry, it manufactures carbon steel, wire rods, nails and other products. It has attracted considerable attention in the steel trade in recent years because of its excellent earnings showing.

Central Alloy was formed in 1926 by the merger of Central Steel Co., Massillon, and the United Alloy Steel Corporation, Canton, Ohio. F. J. Griffiths, who played a most important part in the development of the alloy steel industry and who was chairman of the board of the Central Steel Co., became chairman of the merged corporation. During the past year Central Alloy has acquired rights for the production in the United States of the new alloys developed by the Krupp interests in Germany and is taking a leading part in the introduction of these metals in this country. Both Continental Shares, Inc., and the Cliffs Corporation, Cleveland, investment companies with large steel holdings, with which the Cyrus S. Eaton interests are affiliated, are understood to have an important interest in the Central Alloy Steel Corporation.

Mr. Eaton's recent purchase of a controlling interest in the Donner Steel Co., Buffalo, led to reports that he planned to merge into one company several of the alloy steel plants.

Stockholders of the Interstate company, under the terms of the merger, will receive 1 11/40 shares of non par common stock of the Central Alloy Steel Corporation for each of the 250,000 shares of the outstanding non par common stock of the Interstate company. This ratio, according to a formal announcement sent to the stockholders of the Central Alloy Steel Corporation by F. J. Griffiths, chairman of the board, was arrived at after careful comparison of the relative values of the properties of the two companies.

The announcement further stated that Central Alloy officials have had under consideration for some time the desirability of constructing or acquiring a plant in the Chicago district so as to enable them to compete successfully with other steel companies having plants already located therein.

The merger has been approved by the board of directors of each company and is subject to the approval of stockholders of the Interstate company at a meeting to be held Oct. 16.

Scrap Institute to Hold Conference Oct. 23-24

The National Advisory Council of the Institute of Scrap Iron and Steel, Inc., will hold a special meeting, together with the officers, executive committees of the 12 chapters and special functional committees of the institute, on Oct. 23 and 24 in New York. The meeting will be in the nature of a semi-annual conference of the institute. The committee meetings on Oct. 23 will be held at the institute headquarters at 11 West Forty-second Street, while the meeting and dinner of the National Advisory Council will be held at the Commodore Hotel in New York.

Preceding the meeting of the National Advisory Council, the traffic committee will meet to consider the proper action with reference to securing revision of freight rates on scrap iron and steel. The research committee will also meet to outline a program of research, involving a study of the markets for scrap iron and steel and creating wider markets. A special committee on trade customs will also consider the contractural relations between brokers and dealers and will seek to codify the customs and usages of the trade.

The trade relations committee, which was authorized by the trade practice conference held in Pittsburgh on May 23, will conduct hearings on a docket of complaints which have been filed by consumers and members with the trade relations bureau of the institute.

Prices for Ingot Brass During September

CHICAGO, Oct. 5.—The Non-Ferrous Ingot Metal Institute reports the average prices per pound received by its membership on commercial grades of the six principal mixtures of ingot brass during the 28-day period ended Sept. 13. As there are, as yet, no generally accepted specifications for ingot brass, it must be understood that each item listed below is a compilation representing numerous sales of metal known to the trade by the designation shown, but each item, in reality, including many variations in formulas. Until the program of standardizing the principal specifications, now progressing in cooperation with the American Society for Testing Materials, is completed, the following specifications will be understood to refer to "commercial grades":

	Cents per Lb.
Commercial 80-10-10 (1% impurities)	16.974
Commercial 78% metal	15.161
Commercial 81% metal	15.313
Commercial 83% metal	15.734
Commercial 85-5-5-5	15.972
Commercial No. 1 yellow brass ingot	12.826

H. B. Wilson & Co., Syndicate Trust Building, St. Louis, who have been the sales representatives there of the Whiting Corporation for the last 10 years, will act in the same capacity for the Cleveland Crane & Engineering Co., Cleveland, on and after Oct. 16.

Non-Ferrous Metal Markets

Copper, Lead and Zinc Quiet With Prices Firm—Tin Inactive and Weak

NEW YORK, Oct. 8.

Copper.—Buying is moderate but steady and there are no features. The industry seems to be waiting for the September statistics, which are expected toward the close of the week. Various guesses prevail as to what they will show. A general opinion is that there will be a decrease in stocks of refined metal as well as of copper in the blister form. Consumers have been taking the metal on contract without interruption and production has not been increased. Buying by foreign consumers is in larger volume than that by domestic and is averaging at least 750 to 800 gross tons a day. The delivery involved is October and November, with considerable October metal yet to be purchased. The price is unchanged at 18.30c. c.i.f. usual European ports. It is generally conceded that domestic buyers are well covered for October, though there are occasional sales for that delivery, some of it spot metal. Consumers are now buying November metal more freely and only a little December copper has been sold. Books of fabricators are in a satisfactory condition. Prices are firm and unchanged with electrolytic copper quoted at 18c., delivered in the Connecticut Valley. Lake copper is moderately active and unchanged at 18c. to 18.12½c., delivered.

Tin.—Business in spot Straits tin is very light, and sales for the week ended Saturday, Oct. 5, were not more than 750 tons. Weakness developed in the market on Oct. 3 and 4, induced by the break on the New York Stock Exchange. Yesterday, the London market declined on the announcement that stocks in warehouses in London yesterday were 10,370 tons, the largest ever recorded. This fact, together with the announcement last week that there hangs over the market large estimated shipments from the Straits, has caused buyers to be cautious and has made the entire situation rather weak. London prices today were down £3 to £4 per ton from those of a week ago, with spot Standard quoted at £196 10s., future Standard at £200 10s. and spot Straits at £201. The Singapore market today was £203 10s. In New York today, the market was weak and inactive, with spot Straits tin quoted at 43.37½c., New York. Orders that

THE WEEK'S PRICES, CENTS PER POUND FOR EARLY DELIVERY

	Oct. 8	Oct. 7	Oct. 5	Oct. 4	Oct. 3	Oct. 2
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½	18.12½
Electrolytic copper, N. Y.*	17.75	17.75	17.75	17.75	17.75	17.75

Sheet aluminum	13.75c.	16 00c.
Cast aluminum	12.00c.	14.00c.

come in are in general met by the seller.

Lead.—Buying for November delivery has commenced this week, and sales of several hundred tons today are reported for that delivery. Previous to this the market has been quiet but steady, with most sales consisting of carload and small lots for early delivery. In the heavy buying of August and September consumers covered for most of their October needs. Prices are steady with the leading producer quoting 6.70c., St. Louis. The American Smelting & Refining Co. still maintains its contract price at 6.90c., New York.

Zinc.—With demand still very light, leading producers still hold their quotation for prime Western zinc at 6.80c., East St. Louis, although there are rumors of slight concessions here and there for limited quantities. The feeling is strong that consumers must soon buy the usual volume of metal. With the curtailment in ore production in the Tri-State district, last week's output was only 5500 tons, the smallest since the closing down the first of the year. Sales were 10,650 tons, as compared with 11,400 tons a week ago. Shipments increased about 400 tons to a little over 12,000 tons. The surplus is now about 47,000 tons. The quotation is still $44 per ton, Joplin, which has prevailed since the end of March.

Antimony.—In a very quiet market, Chinese metal is quoted at 8.50c., New York, duty paid, for all positions. It is possible that this could be shaded in some cases for future delivery.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. per lb., with shot nickel at 36c., and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 8.—Sales continue at a satisfactory volume and prices, with the exception of tin, are steady. The old metal market is quiet and prices are nominal.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 44.75c.; lead, 6.80c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.60c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper, bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

The Automatic Transportation Co., Buffalo, manufacturer of electric industrial trucks, tractors and engines, has established a factory branch in Chicago at 531 Pershing Road. L. R. Lindsley, Chicago sales manager, and W. F. Weber, assistant Chicago sales manager, will be in charge of sales and service.

OBITUARY

GUSTAVE THEODORE SHANTS, who was Philadelphia sales manager for the Lukens Steel Co., Coatesville, Pa., for more than 40 years, and president of the Kutztown Foundry & Machine Co., Kutztown, Pa., for more than 30 years, died Oct. 3, at his home, 433 West Upsal Street, Germantown, Philadelphia. He had been confined to his bed since Sept. 7, when he suffered a heart attack at his home. Since last March, he had been away from the office in an endeavor to regain the good health he had enjoyed uninterruptedly in all the years he was engaged in business. He was born in 1868 in Strasbourg, France, to which point his father, who was a minister in the Evangelical Church, had been sent from America as a missionary. When he was four years old, the family came back to America, and it was at the age of 13 that he started work as an office boy with the firm of J. B. Wilson, in the Bullitt Building, Philadelphia. This firm was then the Philadelphia representative of Lukens Steel Co. When Mr. Shants was 21, the Lukens company opened its own office in Philadelphia and he was appointed sales manager, which position he held up to the time of his death. He was a member of the Union League of Philadelphia and secretary of the board of trustees of the First Methodist Episcopal Church of Germantown.

G. T. SHANTS

J. C. MC LAUCHLAN

JAY C. MCLAUCHLAN, partner of Pickands, Mather & Co., Cleveland, died Oct. 8 after an illness of several months, aged 55 years. He was born in Cleveland and educated in University School of that city and at Yale University. After his graduation from the latter institution in 1898 he joined the organization of F. A. Goodrich & Co., Detroit, pig iron sales agent. In 1903 he was appointed sales manager in Detroit for Pickands, Mather & Co. and for the Lackawanna Steel Co. He became affiliated with the home office of Pickands, Mather & Co. in 1917 and on Jan. 1, 1918, became partner in the firm. During the war he served in Washington as director of the pig iron section of the War Industries Board, having been one of the come in are in general met by the tain in the Reserve Ordnance Corps. In recognition of his services during the war he was honored in 1921 by being made a Knight of the Order of the Crown of Italy. Mr. McLauchlan was a director of the Central Alloy Steel Corporation, a director and vice-president of the Toledo Furnace Co. and the Perry Iron Co. and a director of various companies subsidiary to Pickands, Mather & Co.

FRANK TENNEY, secretary of the Pennsylvania Steel Co. for 15 years, before its merger with the Bethlehem Steel Co. in 1916, died of heart disease on the golf course of the Merion Cricket Club, Merion, Pa., on Oct. 5, aged 67 years. He was graduated from the Massachusetts Institute of Technology in 1883 and entered the employ of the Pennsylvania Steel Co., Harrisburg, where he soon became manager. Later he was transferred to the main office in Philadelphia and was appointed secretary about 1901. He retired from active business after the Bethlehem merger.

DAVID L. EYNON, president, Pittsburgh Rolls Corporation, Pittsburgh, died suddenly on Oct. 5, while returning from Europe on the Olympic.

WALTER BIRD MEHL, president, Mehl Machine Tool & Die Co., Roselle, N. J., died on Oct. 4. He was born in Philadelphia and started his career with the Baldwin Locomotive Works as a boy. Subsequently he became superintendent at the plant of the Waltham Watch Co., Waltham, Mass.

Fabricated Structural Steel

Inquiries, at 92,000 Tons, Largest of Year—Jobs in New York District Will Take 63,000 Tons

INQUIRIES for structural steel, at 92,000 tons, have been the heaviest of the year and are regarded by the trade as a forerunner of well-sustained building operations during the fall and early winter. The New York district again has been the most important center of prospective business, 63,000 tons having been added to pending work in New York City and vicinity. The New York Cornell Medical Center will require 18,000 tons and the New York freight terminal of the Lehigh Valley Railroad 21,000 tons. About 35,000 tons, for which inquiries have been made, is for railroad expansion and replacement purposes and 45,000 tons will go into non-industrial buildings.

Awards in the past week amounted to 22,000 tons, three-fourths of which will be needed for non-industrial structures. The largest booking was 2500 tons for a New York office building. Awards follow:

CAMBRIDGE, MASS., 1500 tons, second unit Harvard Business School, to New England Structural Co.

EVERETT, MASS., 700 tons, Warren Foundry & Pipe Co. plant, to McClintic-Marshall Co.

ATTLEBORO, MASS., 150 tons, Masonic temple, to an unnamed fabricator.

LEOMINSTER, MASS., 100 tons, manufacturing plant, to New England Structural Co.

BOSTON, 100 tons, Wood Hydraulic Hoist & Body Co. plant, to Boston Structural Steel Co.

NEW HAVEN, CONN., 1000 tons, Institute of Human Relations Building at Yale University, to Levering & Garrigues Co.

NEW YORK, 2500 tons, Merchants Square Building, to Taylor-Fichter Steel Construction Co.

NEW YORK, 1000 tons, apartment building at 834 Fifth Avenue, to Paterson Bridge Co.

NEW YORK, 500 tons, public school No. 89, to Harris Structural Steel Co.

NEW YORK, 425 tons, public school No. 147, to Easton Structural Steel Co.

NEW YORK, 1500 tons, apartment building on East Eighty-eighth Street, to George A. Just Co.

CORTLAND, N. Y., 150 tons, buildings for Brewer-Titchener Corporation, to Austin Co.

EAST ORANGE, N. J., 1500 tons, apartment building, to Shoemaker Bridge Co.

FLORENCE, N. J., 500 tons, extension to Florence Pipe & Foundry Co. plant, to Belmont Iron Works.

BEDFORD, VA., 200 tons, power house for Bedford Pulp & Paper Co., to Virginia Bridge & Iron Co.

ECCLES, W. VA., 200 tons, mine structures for Chicago, Wilmington & Franklin Coal Co., to Virginia Bridge & Iron Co.

GREENSBORO, N. C., 200 tons, Atlantic bridge, to Virginia Bridge & Iron Co.

GREENVILLE, S. C., 350 tons, work by Fiske Construction Co., to Virginia Bridge & Iron Co.

KINGSPORT, TENN., 300 tons, process building for Tennessee Eastman Co., to Virginia Bridge & Iron Co.

MEMPHIS, 300 tons, paper pulp plant for Buckeye Cotton Oil Co., to Virginia Bridge & Iron Co.

FLINT, MICH., 1700 tons, bank building, to American Bridge Co.

MILWAUKEE, 1000 tons, addition for A. O. Smith Corporation, to Wisconsin Bridge & Iron Co.

CHICAGO, 1000 tons, St. Elizabeth's Hospital, to New City Iron Works, local.

STATE OF MISSOURI, 325 tons, highway bridge, to St. Joseph Structural Steel Co.

EL PASO, TEX., 350 tons, Nichols Copper Co., to Ingalls Iron Works.

GREENVILLE, MISS., 170 tons, high school, to Ingalls Iron Works.

BOONEVILLE, MISS., 100 tons, new school, to Ingalls Iron Works.

DENVER, 1200 tons, Twenty-third Street viaduct, to an unnamed bidder.

GARLAND CITY, ARK., 1100 tons, Red River highway bridge, to Virginia Bridge & Iron Works.

ALBUQUERQUE, N. M., 100 tons, hangar for Western Air Express, to Minneapolis Steel & Machinery Co.

SEATTLE, 175 tons, warehouse for Firestone Tire & Rubber Co., to Hofius Steel & Equipment Co.

SACRAMENTO, CAL., 405 tons, bridge over Trinity River, to United States Steel Products Co.

SAN FRANCISCO, 225 tons, apartment building, Pacific and Laguna Streets, to Golden Gate Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PROVIDENCE, R. I., 300 tons, steel warehouse.

UTICA, N. Y., 225 tons, Spenandoa Corporation plant addition.

NEW YORK, 2000 tons, apartment hotel in Tudor City, East Forty-second Street.

NEW YORK, 18,000 tons, first three units of New York Cornell Medical Hospital.

NEW YORK, 1500 tons, public schools Nos. 147 and 153.

NEW YORK, 2500 tons, apartment building at 770 Park Avenue.

STATEN ISLAND, N. Y., 1000 tons, bridge; Charles Meade & Co., low bidder.

LEHIGH VALLEY RAILROAD, 21,000 tons, railroad freight terminal in New York, on block bounded by Eleventh and Thirteenth Avenues, Twenty-sixth and Twenty-seventh Streets.

BROOKLYN, 6500 tons, telephone building on Bridge Street.

LONG ISLAND RAILROAD, 7000 tons, grade crossing elimination work.

NEW YORK CENTRAL RAILROAD, 2500 tons, commissary building on East 161st Street, New York; general contract to Babor & Comeau.

PENNSYLVANIA RAILROAD, 1500 tons, electrification work at Norristown, Pa.

SUDBURY, ONT., 200 tons, office building; bids being taken by V. L. Morgan, 145 Yonge Street, Toronto.

MONTREAL, 2000 tons, office building for James T. Stranger & Co., 618 James Street, West.

MONTREAL, 400 tons, Y. M. C. A. addition, bids being received by Ross & Macdonald, 1 Belmont Street.

ERIE, PA., 200 tons, Lady of Charity Chapel and dormitories.

CLEVELAND, 300 tons, department store for Lakewood Land & Securities Co.

CLEVELAND, 1500 tons, Cleveland public school office building.

CLEVELAND, 400 tons, Cleveland Heights junior high school.

INDIANAPOLIS, 5000 tons, bridge for Union Traction Co.

PEORIA, ILL., 310 tons, St. Vincent's Convent, to Gage Structural Steel Co., Chicago.

RIVER FOREST, ILL., 350 tons, Bowman Dairy Co., to an unnamed bidder.

MILWAUKEE, 200 tons, railroad overhead for city; general contract to Steve Czaplewski & Sons, Inc., local.

KEWAUNEE, WIS., 525 tons, State highway bridge; general contract to Ferguson Construction Co., Rockford, Ill.

CHICAGO & NORTH WESTERN, 400 tons, bridge work.

STATE OF OKLAHOMA, 1000 tons, State highway bridge.

OKLAHOMA CITY, 3000 tons, Colcord Hotel.

SAN ANTONIO, TEX., 3000 tons, Southwestern Bell Telephone Co. building; W. J. Knight & Co., St. Louis, engineers.

TACOMA, WASH., 2400 tons, Eleventh Street viaduct; bids Oct. 21.

SEATTLE, 1000 tons, Fourteenth Avenue South bridge; bids Oct. 21.

SEATTLE, 243 tons, approaches for West Spokane Street bridge; bids Oct. 11.

SEATTLE, 100 tons, two telephone buildings for Pacific Telephone & Telegraph Co.; bids being taken.

SEATTLE, 100 tons, sack house for Fisher Flouring Mills Co.; bids being taken.

SACRAMENTO, CAL., 738 tons, bridge over Shasta River near Yreka; general contract to H. E. Doering, Portland, Ore.

SAN FRANCISCO, 500 tons, canning plant for California Packing Corporation in Togoloan, Philippine Islands; bids being taken.

SAN FRANCISCO, 350 tons, canning plant for California Packing Corporation in Tahiti; bids being taken.

OAKLAND, CAL., 240 tons, transit shed No. 2 for Port Commission; Pacific Coast Engineering Co., low bidder.

Railroad Equipment

Southern Orders 2000 Cars and May Buy 2500 More

DEMAND for railroad equipment continued active the past week. Orders were placed for 2500 cars, of which 2000 are for the Southern Railway. The Chicago & North Western bought 500 flat cars. Business in prospect is large. The Southern is expected to contract for an additional 2500 cars and the Chicago & North Western for 2000. The Louisville & Nashville may come into the market soon for about 3000 cars. In addition to its inquiry for 75 locomotives, the Pennsylvania probably will build 25 at its Altoona, Pa., shops. Details of the week's business follow:

Southern Railway has ordered 1500 steel hopper cars from Pressed Steel Car Co. and 500 from an unnamed company. This road is expected to place additional orders for about 2500 cars.

Louisville & Nashville is expected to come into the market shortly for about 3000 cars.

Chicago & North Western has ordered 500 flat cars from American Car & Foundry Co. It is reported that this road may buy 2000 box cars.

In addition to the 75 locomotives for which the Pennsylvania is inquiring in the open market, this road probably will build 25 at its Altoona, Pa., shops.

Great Northern may come into the market for 1000 box cars.

Denver & Rio Grande Western will buy two baggage mail cars.

Chicago, Burlington & Quincy is in the market for eight 4-8-4 and 12 Hudson type locomotives.

PERSONAL

C. K. EVERITT, managing director, Edgar Allen & Co., Ltd., Sheffield, England, was given a special luncheon in New York, Sept. 26, two days prior to his sailing for England, by the officers of the American company, the Edgar Allen Steel Co., Inc., New York. Arrangements were incorrectly stated in this column Oct. 3, in an account which listed the other guests.

—

R. B. POGUE, of the engineering department of the American Brake Shoe & Foundry Co., New York, has been appointed assistant chief engineer of that company.

—

JAMES A. HALL, professor of engineering, Brown University, addressed the machine shop section of the Providence Engineering Society, Oct. 8, on "What Science Is Doing for the Machine Shop."

—

WALTER KNAPP, at one time engaged in organization work in the establishment of wage incentive plans for the General Electric Co., has become executive engineer of the DeWalt Products Corporation, Leola, Pa., manufacturer of high-speed cutting equipment for wood, metal and stone.

—

HIBBARD S. GREENE, formerly vice-president and director of the Barber-Greene Co., Aurora, Ill., has been appointed assistant to C. R. MESSINGER, president, Chain Belt Co., Milwaukee.

—

R. E. KELLY, who has been manager of the Boston office of the Independent Pneumatic Tool Co., Chicago, has been made sales engineer for the Eastern district, with headquarters in New York. JOHN ASHTON, heretofore in the New York district, has been appointed manager of the Boston office.

—

J. S. MCCLELLAND has been appointed manager of the newly opened branch warehouse in Detroit of William Jessop & Sons, Ltd., Sheffield, England.

—

A. N. GODDARD, Goddard & Goddard Co., Detroit, is scheduled for an address on milling cutters before the Detroit Engineering Society on the evening of Oct. 28.

—

JOHN M. GAINES, JR., formerly associate physical chemist, Pittsburgh Experiment Station, United States Bureau of Mines, has resigned to engage in some advanced study at the Massachusetts Institute of Technology, Cambridge, Mass. For the past three years he has been associated with C. H. HERTY, JR., on the general problem of the physical chemistry of steel making.

—

H. C. POWELL, superintendent and director of Vincent-McCall Co., Kenosha, Wis., spring manufacturer, is retiring from official connection with the concern because of ill health. His combined service with the company and its predecessor, the Windsor Spring Co., totaled more than 25 years.

—

C. H. MACDONALD, heretofore director of sales and head of the market research department of the Colorado

C. H. MACDONALD

Fuel & Iron Co., Denver, has been elected vice-president of the company, in charge of sales in California.

—

EDMUND P. BURKE, who for many years was associated with the San Francisco and Los Angeles offices of the Truscon Steel Co., Youngstown, has resigned to become Chicago manager for the R. C. Mahon Co., Detroit, structural steel fabricator.

—

JOHN D. GILCHRIST, for several years purchasing agent of the hydraulic pressed steel division, Cleveland, of the Truscon Steel Co., has become affiliated with the sales department of G. F. Mitchell & Son, Cleveland, manufacturer of sheet metal stampings.

—

ROBERT W. WOODRUFF has been elected president and chairman of the board of the White Motor Co., Cleveland, to fill the vacancy caused by the death of WALTER C. WHITE. Starting in the White company's branch at Atlanta, Ga., Mr. Woodruff eventually became vice-president and general manager of sales. Later he was elected president of the Coca-Cola Co., Atlanta, and gave up the sales managership of the White company but continued as a director and member of the executive committee. Promotions of four White company officials have been announced. SAUNDERS JONES has been named vice-president and assistant to the president; GEORGE H. KELLY, vice-president and treasurer; H. D. CHURCH, vice-president in charge of engineering, and GEORGE W. SMITH, JR., vice-president in charge of production.

—

H. C. THOMAS, recently assistant general manager of the merchandising department of the Westinghouse Electric & Mfg. Co., with headquarters at Mansfield, Ohio, has been appointed director of manufacturing stocks of the company, with headquarters at East Pittsburgh. He will be responsible for methods used in the control of all raw materials, work in progress and finished parts stock. Mr. Thomas was graduated from Purdue University in 1910, and, with the exception of a brief interruption during the war period, he has been continuously identified with various departments of the Westinghouse Electric & Mfg. Co.

—

LOUIS RASMUSSEN, foundry superintendent, Nash Motors Co., Kenosha, Wis., will address the Quad-City Foundrymen's Association at a meeting to be held at the Fort Armstrong Hotel, Rock Island, Ill., Oct. 21. His subject will be "Advancement in the Foundry During the Last 10 Years."

—

CHARLES PIEZ, chairman of the board, Link-Belt Co., Chicago, has been elected president of the American Society of Mechanical Engineers for the year beginning with December. RALPH E. FLANDERS, manager, Jones & Lamson Machine Co., Springfield, Vt., and ERNEST L. JAHNCKE, Assistant Secretary of Navy, Washington, have been elected vice-presidents.

—

HAROLD V. COES, Ford, Bacon & Davis, New York, JAMES D. CUNNINGHAM, president, Republic Flow Meters Co., Chicago, and CLARENCE F. HIRSHFELD, chief, research department, Detroit Edison Co., Detroit, have been elected managers.

Minneapolis Company Has Industrial Department

The Minneapolis-Honeywell Regulator Co., Minneapolis, Minn., has formed an industrial department under the direct supervision of W. L. Huff, vice-president, which will maintain a staff of specialty engineers working out of branch offices located in 24 cities. Concurrent with this announcement comes word of the near completion of the new six-story addition to the Minneapolis factory of the company at a cost of $300,000.

The company has manufactured heating control equipment for domestic and industrial uses for 43 years and specializes in the manufacture of instruments for temperature control and of complete control systems for heating. Three branch factories are operated at Wabash, Ind.

Tin Plate Demand Is Good in Europe

British and German Mills Active—Cleveland Pig Iron in Demand—Tube Plants Close in Germany—Manchuria to Add Open-Hearth Furnaces

(*By Cable*)

LONDON, ENGLAND, Oct. 7.

INCREASED activity has developed in pig iron as Cleveland makers are now able to accept orders on limited quantities for early delivery. Costs are rising steadily and Midland and West Coast furnaces are asking higher prices.

East Coast hematite producers assert that the current market is several shillings a ton less than cost and are seeking higher prices although, as yet, unsuccessfully.

Heavy steel business is irregular, some plants being well supplied until the end of the year, while others are in need of new specifications, as old orders have been executed. Export demand is slack, but South Africa is displaying increased interest and some Canadian orders have been secured.

Tin plate demand is good and works are well booked for the first quarter with some good orders for delivery up to June. Prices are firm, with an upward tendency as a result of increasing costs. Galvanized and black sheets are quiet.

The Continental steel market is quiet, and mills are in need of export orders, although in some cases, particularly in France, works are well engaged with domestic business. Prices display an easier tendency, especially in merchant steel.

Belgian production in August was 347,000 metric tons of pig iron, 355,000 tons of raw steel and 306,000 tons of rolled steel. At the end of August 57 furnaces were in blast. Saar production in August was 182,000 metric tons of pig iron and 192,000 tons of raw steel.

British Hatry Failure Blocks Merger

Delay in Acquiring United Steel Companies Precipitated Collapse—Foreign Competition in Steel Relaxes

LONDON, ENGLAND, Sept. 25—Developments in the iron and steel trade have been somewhat overshadowed by the sensational disclosures attending the failure of the so-called "Hatry" group of companies. One of the companies involved was the Austin Friars Trust, which acted as negotiator in the plan to purchase the United Steel Companies and form Steel Industries of Great Britain, Ltd. This was to be only the beginning of a gigantic steel corporation, which Mr. Hatry had previously explained would eventually have a capital larger than the Imperial Chemical Industries, Ltd. Apparently the collapse of the Hatry issues was precipitated by the failure to complete negotiations with the United Steel Companies.

Business has been in fair volume, but there has not yet been any real fall revival. The brightest spot at the moment is pig iron. Cleveland and Midland producers are heavily sold, the former on restricted output. A number of additional furnaces could be put into commission, but increasing costs of production are an obstacle. Foreign pig iron is no longer competitive here, but at the same time British furnaces are unable to compete freely abroad; hence the business coming to them is mostly from domestic sources.

Steel mills are still in need of orders. Shipbuilding is slow to develop with the result that, while a number of plate mills are well engaged, others are operating irregularly. Foreign competition is still encountered in certain districts, but it is less severe as costs of production are increasing on the Continent. Some mills, however, seem unable to cope with the situation, and the Ebbw Vale Steel Iron & Coal Co. has announced its intention to suspend operations.

There has been a distinct improvement in the tin plate trade. Consumers at home and abroad are buying freely, even into the first half of next year. Many mills are sold out for this year and have a good tonnage on their books for the first quarter of next year. Prices have ad-

*Open-hearth steel, 10s. ($2.42) per ton extra.

vanced appreciably, and are now about 1s. (24c.) per base box more than the agreed minimum, and with costs increasing will probably go still higher.

Japan Buys German Steel Mill Equipment

HAMBURG, GERMANY, Sept. 23.—The Deutsche Maschinenbaugesellschaft (Demag) has booked an order from the Anzan Steel Works of the South Manchuria Railroad Co. for four 120-ton open-hearth furnaces. This is in addition to a contract for six 100-ton furnaces placed some weeks ago. The furnaces are to be installed by Japanese engineers from drawings furnished by the maker. These engineers are now in Germany studying furnaces of the same type in operation in the Ruhr. The Siemens-Schuckert A. G. recently received a repeat order for electric locomotives from the Fu-Shun mines of the South Manchuria Railroad Co.

German Mills to Add Tin Plate Capacity

HAMBURG, GERMANY, Sept. 23.—Tin plate mills in Germany are planning a considerable increase in capacity. August output reached a new record, totaling 13,089 tons, and extensions being planned would more than double this amount. It is noteworthy that little tin plate from Welsh mills is now reaching Germany and only a few thousand tons a month is being imported from the Saar. Exports of tin plate have averaged 3500 tons a month this year.

German Export Trade Fair Despite Higher Prices

BERLIN, GERMANY, Sept. 24.—The outlook for business is uncertain. The financial situation has not improved and unemployment is increasing. The coal, steel and chemical industries, however, are well engaged and the foreign trade balance has gained. August showed an export surplus of 117,000,000 m. ($27,846,000), and exports of manufactured goods of all kinds, totaling 883,500,000 m. ($210,293,000), were the largest since the war. Production of iron, steel and rolling mill products in August was larger than in August, 1928. Rolled products, particularly, registered a considerable advance, the total for August of this year being 1,012,666 metric tons compared with 979,421 tons for August, 1928.

Production of plates in the first eight months of this year showed a marked increase, while output of bars and structural shapes declined.

Export business is quiet at present, but the Stahlwerksverband has concluded some substantial contracts for delivery of semi-finished material to British consumers at prices about 2s. (49c.) per metric ton higher than on preceding contracts. Export demand for slabs, wire rods and wire is better, and prices are slightly higher than those of Belgian, French and Luxemburg makers. German exports of pig iron to Belgium are increasing, with 135,000 tons shipped in the first seven months of this year compared with 60,500 tons in the same period of 1928.

The *Deutsche Bergwerks Zeitung* has called attention to Germany's increased exports of steel bars to the United States. In 1928 bar exports to the United States were 31,600 tons, while in the first seven months of this year they totaled 29,900 tons. Sales of bands, structural shapes and sheets to the United States have also gained. It is suggested that, despite freight rates and projected increases in the American tariff, exports in these products may be further expanded.

Sweden Establishes New Iron Ore Classification

HAMBURG, GERMANY, Sept. 23.—Swedish producers and exporters of iron ore have agreed to classify their ore in four instead of three grades. The new standards will be No. 1 low phosphorus ore, not over 0.04 per cent phosphorus; No. 2 phosphorus, not over 0.07 per cent; No. 3 phosphorus, with more than 0.07 per cent phosphorus, and a new grade, "pure" iron ore, with a guaranteed maximum of 0.009 per cent phosphorus and 50.1 per cent iron. This fourth grade will also be supplied with the following analyses: P. 0.01 per cent and Fe 55.6 per cent; P. 0.011 per cent and Fe 61.1 per cent; and P. 0.0126 per cent and Fe 70 per cent. Of the total Swedish iron ore shipments in the past 20 years, amounting to 112,700,000 tons, it is stated that about 7 per cent was special, so-called pure iron ore, about 10 per cent No. 1 low phosphorus ore, about 37 per cent No. 2 grade and the rest No. 3.

Russian Purchases Here Total $109,000,000

Production of large-scale industry in Russia in the fiscal year 1928-1929, which ended Oct. 1, was 60 per cent above the 1913 total, says a report of the Amtorg Trading Corporation, New York. Production of electric power was three and one-half times the pre-war level and the railroad freight movement was one-third larger.

A favorable trade balance of more than $10,000,000 was attained in the past fiscal year, in contrast with a large adverse balance the previous year. Russian-American trade reached a record total of $149,000,000, compared with $113,000,000 in the previous fiscal year and only $48,000,000 in 1913. Of the total for 1928-1929, $109,000,000 represented purchases in the United States by the Amtorg Trading Corporation, which bought $73,000,000 worth of materials, and by the All-Russian Textile Syndicate, Centrosoyus, Selskosojus.

Purchases by the Amtorg Trading Corporation of industrial and electrical equipment totaled $30,000,000. Of the various Russian industries in the market for American machinery, the oil industry made the largest purchases last year, buying about $9,000,000 worth. Equipment for steel mills and the machine-building industry accounted for an outlay of $5,500,000. Development of the metallurgical and machine-building industries in the U.S.S.R. along American lines, says the report, promises to increase their importance as consumers of equipment produced in the United States.

Spiegeleisen Imports Large This Year

Imports of spiegeleisen into the United States this year are fairly large. To Sept. 1, according to official data, 12,228 gross tons had come in. This is at the rate of 1528 tons per month and compares with 435 tons per month in 1928. The spiegeleisen imported is material containing less than 30 per cent manganese and over 1 per cent carbon. The comparative statistics are as follows:

	Total	Per Month
1929 (8 mos.)	12,228	1,528
1928 (year)	5,218	435
1927 (year)	7,460	621

Thus imports this year are nearly four times the rate in 1928. The value of the 12,228 tons imported this year is put at $356,680. This is about $29 per ton. August imports were 985 tons valued at $29,770.

New Record in Agricultural Implement Exports

Shipments of agricultural implements and machinery from the United States for the first eight months of 1929 reached $100,463,571, a new record and an increase of 23 per cent over the like period of 1928, when exports amounted to $81,686,133. Implement exports during August amounted to $13,672,238, a slight decrease from August, 1928, when shipments reached $13,696,704.

German Tube Output Cut

HAMBURG, GERMANY, Sept. 23.—The unsatisfactory situation in the tube market has led the Vereinigte Stahlwerk A. G. to close its tube strip mill at Düsseldorf and to dismiss the workmen. Tube mill No. 1, also at Düsseldorf, is operating only a few days a week. Other tube mills in Germany are expected to suspend completely or drastically curtail their production.

Tungsten Alloys Up

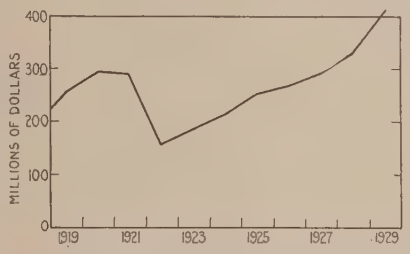
HAMBURG, GERMANY, Sept. 23.—On Sept. 20 producers of all grades of tungsten alloy steels advanced prices about 10 per cent.

Machinery Exports Decline in August

But Volume Is Still High and Eight-Month Total Is New Record, 24½ Per Cent Above 1928—Imports Continue Heavy

WASHINGTON, Oct. 7.—Declining $6,794,704, exports of machinery of all kinds from the United States in August were valued at $50,178,881, compared with $56,973,585 in July, which was the second highest total ever reached. Compared with exports of August, 1928, valued at $44,305,606, an increase of $5,873,275 is recorded. For the eight months ended with August, 1929, exports were valued at $413,460,580, a new high record and an increase of 24.5 per cent over those for the corresponding period of last year, valued at $331,884,809, which was previously the highest for the period.

Exports of machinery and vehicles in August were valued at $90,453,070, a decrease of $16,244,345 from July, $107,697,415, and a decline of $3,878,017 from August of last year, $94,331,087. For the eight months of the current year exports of machinery and vehicles were valued at $869,824,359, compared with $698,134,217, an increase of $171,690,142, or 24.6 per cent, over the like period of last year.



Eight-Month Machinery Export Totals Have Grown Steadily from the Low Point in 1922. Two New High Records Coming in 1928 and 1929

Industrial machinery exports, as classified by the Division of Statistics, Department of Commerce, were valued at $23,154,869 in August, 1929, as compared with $25,322,120 in July and $19,050,329 in August of last year. For the eight months of 1929 they were valued at $187,025,985, against $148,309,884 for the corresponding period of last year.

Total exports of power-driven metal-working machinery in August were valued at $2,315,664 compared with $2,913,687 in July and $2,650,532 in August of last year. For the eight months they were valued at $22,361,291 in 1929, against $17,351,134 in 1928. Power-driven metal-working exports listed in THE IRON AGE table represented 894 units, valued at $1,342,908, in August, against 1180, valued at $1,480,982, in July.

Exports of agricultural implements in August were valued at $13,672,000, against $14,722,000 in July and $13,697,000 in August of last year. For the eight months the value of this class of exports rose this year to $100,472,000 from $81,686,000 for the like period of last year.

Imports of machinery and vehicles in August were valued at $3,493,152, against $4,036,771 in July and $2,729,543 in August of last year. For the

Other industrial machinery	905,408	914,834	8,230,371	6,490,752
Vehicles except agricultural	713,404	301,787	3,868,192	2,043,195
Total	$2,602,309	$2,081,751	$21,716,902	$13,916,841

eight months they totaled $29,389,463, showing the sharp gain of $10,421,102 or 54.9 per cent over similar imports for the first eight months of 1928, valued at $18,968,361. This increase, along with gains in other import lines, is attributed to pending tariff legislation.

Imports of industrial, office and printing machinery in August were valued at $1,886,880, compared with $2,288,438 in July and $1,829,834 in August, 1928. For the eight months of 1929 they were valued at $16,662,852, an increase of 41.5 per cent over such imports for the corresponding period of last year, valued at $11,776,942.

Imports of machinery listed in THE IRON AGE table were valued at $2,602,309 in August, compared with $2,855,506 in July and $2,081,751 in August of last year. For the eight months this class of imports entering the United States was valued at $21,716,902, an increase of $7,800,061 or 56.4 per cent over last year. Sharp gains were made in imports of all kinds, except electrical machinery and apparatus.

Preparing to Take the Census

Enumeration of Population and Study of Many Phases of Activity to Be Undertaken

WASHINGTON, Sept. 30.—Preliminary work of organizing for the decennial census of 1930, the Department of Commerce announced today, consists of two major developments, including the employment of specialists in certain phases, such as distribution, unemployment, agriculture, occupation and manufactures, and the intensive training of a force of 573 supervisors, who will have charge of the activities of approximately 100,000 enumerators.

The specialists will be recognized authorities in their respective fields. They will cooperate with the regular census force in deciding upon the questionnaires and the instructions for their application. Their principal duties, however, will relate to the preparation of the final reports and the presentation of the data in the most practical and usable form.

In training the supervisors the Bureau of the Census is endeavoring to take advantage of the intervening time to make certain that each of these officials personally understands the different branches of the census of which he will have charge. To accomplish this, it is necessary to develop extensive correspondence with each supervisor. Most of the form letters have been established and a large number of supervisors have already received them.

Supervisors Must Prepare Reports

Previously it has been the practice to appoint the supervisors and immediately thereafter appoint the assistant supervisors. In a number of cases the supervisor turned the work over to the assistant. Radical changes will be made in this respect at the coming census. The bureau proposes to be careful that the supervisor understands the work, and actually performs some branches of it before next February, when the assistants will be appointed. In the meantime, the supervisors will have been required to prepare reports on the different census schedules concerning which they will have to instruct their enumerators. The Director of the Census or some other official of the bureau will have had personal contact with every supervisor.

All of the enumerators will be required to pass an examination designed not only to test their ability to do the work, but to make certain that they understand what is to be done and how it is to be done, before they will be appointed. Responsibility for correct work will be placed directly upon the supervisors.

Buildings 2000 Ft. High Structurally Possible

Skyscrapers 2000 ft. high are structurally possible, according to a study just completed for the American Institute of Steel Construction. This study of building height has been in progress for the past two years under the direction of W. C. Clark, chief economist and vice-president of S. W. Straus & Co. It was made for the institute by independent research for the purpose of providing unbiased proof that tall buildings in congested centers are economically advisable. The report found that buildings of 75 stories are not only economical, but under certain conditions will return more on the investment than a building of 50 stories or 30 stories.

These conclusions were based upon investigations made upon specific plans for various buildings of varied heights drawn by J. L. Kingston, architect of the staff of Warren & Wetmore. In making the studies the cooperation of numerous experts was enlisted, such as Stephen F. Voorhees of Voorhees, Gmelin & Walker; R. H. Shreve of Shreve & Lamb; David Lindquist, chief engineer of the Otis Elevator Co.; S. F. Holtzman and David C. Coyle of Gunvald-Aus, consulting engineers; the Levering & Garrigues Co. and the McClintic-Marshall Co., steel fabricators; Otto Goldschmidt, consulting engineer and expert on mechanical equipment; Hatzel & Buehler, electrical contractors; W. G. Cornell Co., plumbing, and in the building managers and rental field such experts as Lee Thompson Smith, Clarence T. Coley and William C. Demorest.

Industrial Consumption of Electricity Dips

August industrial activity in the United States, as rated by *Electrical World*, was 128.2, compared with 129 in July and with 120.8 in August, 1928. The figures are based upon monthly electrical energy consumption by 3600 scattered manufacturing plants, the average of 1923-1925 being 100.

The metal industries group dropped from 144.2 to 140.7, this being the net result of an increase in rolling mill and steel plant consumption from 144.4 to 150.9 and a decline in consumption of metal-working plants, ferrous and non-ferrous, from 144 to 134.6. Automobile plant consumption, including plants manufacturing parts, went up from 139.5 to 143.

Other industries showed varying changes, increases being recorded for leather, stone, clay and glass, paper and pulp and food products, while decreases were registered by textiles, forest products, rubber and its products, chemicals and shipbuilding.

Metallgesellschaft, Frankfort-on-Main, Germany, has started the publication in English of a *Periodic Review*, which will contain not only current statistics on lead, copper, zinc and tin, but also technical articles describing details of smelting plants and operations on these metals, as represented by practice in that company's own plants or of others allied to it.

Employment and Payroll Totals in Identical Plants in August and July (a)

	Establishments	Number on Payroll		Weekly Payroll (b)

Machinery Markets and News of the Works

Cleveland Show Big Success

Amtorg Purchases $1,200,000 Worth of Tools for Soviet Tractor Plant

WITH an attendance exceeding 20,000, including a large number of visitors from almost every country in the world, the National Machine Tool Exposition in Cleveland the past week was an outstanding success.

A substantial volume of orders was placed by buyers at the show and the extraordinary interest manifested by machine tool users is regarded as a forerunner of an active trade in the next few months.

The largest individual transaction was the purchase during the week of $1,200,000 worth of tools by the Amtorg Trading Corporation for installation in a tractor plant in Soviet Russia. Among the machines bought were 48 single-spindle drilling machines, eight automatic screw machines and 19 grinders. Considerable business, still pending, is expected to be placed by the Amtorg company in the immediate future.

Reports from machine tool centers indicate that bookings have been of fair volume and that production will remain steady at its present high rate during the remainder of the year. Demand for heavy tools has been unusually good.

The Chicago, Milwaukee, St. Paul & Pacific has contracted for two frog and switch planers, but railroad buying in general has been negligible. The Chesapeake & Ohio and the Norfolk & Western are considering issuing lists within a short time.

Few orders are coming from the automobile industry. In fact, almost all business is well distributed in the general industrial field.

New York

NEW YORK, Oct. 8.—So many machine tool sales executives and salesmen were in Cleveland last week attending the National Machine Tool Exposition that comparatively little business was done in this market. However, most of the sellers who were at Cleveland got oral orders or promises of orders and returned to New York with optimism that the remaining months of the year will bring a considerable volume of new business. The Amtorg Trading Corporation, 165 Broadway, New York, continues to place orders for the new tractor plant being built in Soviet Russia. A large pump and condenser manufacturer is expected to place large orders soon. A truck company was one of the week's buyers.

Plans are under way by Robert Gair Co., 420 Lexington Avenue, New York, manufacturer of corrugated boxes and containers, for four-story addition, 200 x 500 ft., to plant at Piermont, N. Y., to cost over $450,000 with equipment.

Seal Lock Burial Vault Co., Forest Hills, L. I., has awarded general contract to M. T. Heeg, Woodhaven Boulevard, Elmhurst, L. I., for one-story plant unit, to cost about $45,000 with equipment. W. J. Boegel, 185 Madison Avenue, New York, is architect.

Broadway Auto Radiator Co., 123 West Fifty-second Street, New York, has leased building at 449 West Fifty-fourth Street for new automobile radiator repair and chromium plating works.

New York Trap Rock Corporation, 252 Water Street, Newburgh, N. Y., has plans for new stone crushing, storage and distributing plant at Clifton Point, N. Y., to cost over $500,000 with equipment. Heidenreich Engineering Co., Kansas City Life Building, Kansas City, Mo., is consulting engineer.

American Seal Kap Corporation, 11-05 Forty-fourth Drive, Long Island City, manufacturer of milk bottle caps, etc., has acquired adjoining factory, 100 x 200 ft., for expansion.

Knickerbocker Ice Co., 41 East Forty-second Street, New York, has filed plans for four-story ice-manufacturing plant, to cost about $200,000 with equipment.

Swan-Finch Oil Corporation, 205 East Forty-second Street, New York, has plans for rebuilding part of lubricating oil refinery at Linden, N. J., recently destroyed by fire, with loss of about $400,000 with equipment, reconstruction to approximate like sum.

William Shary, 22 East Seventeenth Street, New York, architect, has plans for an eight-story automobile service, repair and garage building, to cost about $130,000 with equipment.

Officials of Remington Arms Co., 25 Broadway, New York, with plants at Ilion, N. Y., and Bridgeport, Conn., have organized Remington Automatic Quotation Board Corporation, a subsidiary, to manufacture automatic-operated stock exchange and other record boards where rapid change in figures is required. It is understood that part of one of present plants will be given over to production of new specialty.

Port of New York Authority, 75 West Street, New York, has acquired property for fourteen-story freight and warehouse terminal, comprising block bounded by Fifteenth and Sixteenth Streets, Eighth and Ninth Avenues, to cost about $15,000,000; installation will include elevating, conveying and other mechanical-handling equipment. Howard S. Cullman is chairman of inland terminal committee of board.

Wright Aeronautical Corporation, Paterson, N. J., manufacturer of aircraft engines and parts, has awarded general contract to J. W. Ferguson Co., 152 Market Street, for another one-story addition, to cost about $500,000 with equipment.

Pennsylvania Railroad Co., Pennsylvania Terminal, New York, has plans by Gibbs & Hill, Inc., same address, consulting engineer, for electrification of lines from Manhattan Transfer on Newark meadows to New Brunswick, N. J., to cost about $6,000,000 with power equipment and other machinery.

Annandale Graphite Co., Annandale, N. J., is planning new one-story plant unit, to cost more than $35,000 with equipment.

Electro-Matic Mfg. Co., Newark, recently organized, has leased part of former plant of Stengel-Rothschild Co., 137 Kossuth Street, and will remodel to manufacture automatic electric heaters and parts, to cost more than $65,000.

DeLuxe Auto Body Co., 5124 Boulevard, West New York, N. J., is considering new one-story plant for parts and assembling, to cost about $40,000 with equipment.

General Box Top Co., 568 Park Avenue, West New York, N. J., has awarded general contract to Bonanno Brothers, 1827 Bergen Turnpike, North Bergen, N. J., for new two-story plant, to cost about $70,000 with equipment.

Kolster Radio Corporation, 200 Mount Pleasant Avenue, Newark, manufacturer of radio equipment and parts, has purchased Earl Radio Corporation, 122 East Forty-second Street, New York, manufacturer of similar equipment, with main plant at Clifton, N. J. Large part of production in future will be concentrated at Clifton works. Rudolph Spreckels will be chairman of board of consolidated company.

New England

BOSTON, Oct. 7.—The local machine tool market the past week was very quiet and no sale of importance was reported by new tool dealers. In used equipment, transactions included a few lathes, drilling tools, a planer and a milling machine. Less activity was noted at some of the New England machine tool plants, owing to the fact that officials were attending the Cleveland exposition.

Sales of small tools hold up remarkably well. September business was considerably in excess of that for the corresponding month last year, and about on a par with August, this year.

Bird Machine Co., Washington Street, South Walpole, Mass., closed bids Oct. 4 for a boiler shop.

H. E. Holdbrook, Winona Street, Worcester, Mass., manufacturer of drop forgings, is taking bids on a one-story plant unit, 40 x 65 ft.

Randall & McAllister, 84 Commercial Street, Portland, Me., has started work on a one-story machine shop addition, 20 x 42 ft.

Nutmeg Crucible Steel Co., Branford, Conn., has started construction of a one-story foundry, 70 x 100 ft., to cost $20,000 without equipment.

Superior Spring & Mfg. Co., 373 Washington Street, Hartford, Conn., has plans for a one and two-story manufacturing and storage unit.

Westfield Boys Trade School, Westboro, Mass., has plans for a three-story trade school addition, 75 x 180 ft.

Wood Hydraulic Hoist & Body Co., Detroit, has started work on a one-story, 50 x 180 ft., addition on North Beacon Street, Boston.

Moore Drop Forging Co., Walter Street, Springfield, Mass., has plans for extensive plant alterations. Purchase of hammers is under consideration.

Bids were closed Oct. 8 for an airport at Warwick, R. I., to cost $300,000. Plans include a small machine shop for which equipment will be purchased.

Package Machinery Co., Springfield, Mass., Baker Perkins Co., Inc., Saginaw, Mich., and National Bread Wrapping Machine Co., Nashua, N. H., have consolidated. It is planned to move Nashua plant equipment to Springfield.

Bids will be asked in about 60 days by Continental Pipe & Mining Co., 475 Fifth Avenue, New York, Herbert Kennedy, president, for initial units of pipe-manufacturing plant on property recently acquired at Chelsea, Mass., to cost more than $1,000,000 with equipment. Fay, Spofford & Thorndike, 44 School Street, Boston, are engineers.

Norma-Hoffman Bearings Corporation, Stamford, Conn., manufacturer of precision ball bearings, thrust bearings, etc., will take bids at once for one and two-story addition, 100 x 200 ft., to cost about $90,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., is architect and engineer.

Boston & Albany Railroad Co., South Station, Boston, has awarded general contract to Tredennick-Billings Co., 10 High Street, for new engine house, with shop and repair facilities at West Springfield, Mass., to cost over $200,000 with equipment.

Continental Airports, Inc., care of Leo F. Caproni, 1056 Chapel Street, New Haven, Conn., consulting engineer, has plans for airport buildings at Milford, Conn., including hangar, repair shop, gas and oil storage units, to cost about $100,000 with equipment.

Firestone Tire & Rubber Co., Akron, Ohio, has purchased former Peabody mill of Dwight Mfg. Co., Newburyport, Mass., for branch plant. Extensions and improvements are planned.

Pratt & Whitney Aircraft Corporation, Hartford, Conn., has awarded general contract to R. G. Bent Co., Inc., 93 Edwards Street, for one and two-story power plant, 52 x 125 ft., to cost about $80,000 with equipment.

The Crane Market

INQUIRY for overhead traveling cranes continues rather limited. In the past week Sanderson & Porter, engineers, New York, have inquired for a 100-ton, 34-ft. span, 4-motor power house crane with 10-ton auxiliary, for the Cerro de Pasco Copper Co. Locomotive crane inquiries include a 50-ton crane for the New York Central Railroad, which is in addition to the inquiry for two 25-ton cranes, pending award for some weeks. The low bidder on two 25-ton locomotive cranes for the Mare Island Navy Yard was the Orton Crane & Shovel Corporation, but award has not yet been made. The V. D. Simmons Co., consulting engineer, Chicago, is inquiring for a 5-ton, 60-ft. span electric traveling crane for the Bryant Paper Co., Kalamazoo, Mich.

Among recent purchases are:

City of Holyoke, Mass., 15-ton crawl-tread crane from Northwest Engineering Co.

Pittsburgh Tube Co., Monaca, Pa., 5-ton, 55-ft. 7-in. span, electric traveling crane from Northern Engineering Works.

Cleveland

CLEVELAND, Oct. 7.—The center of machine tool activities the past week was the floor of the machine tool show. A number of new models which were demonstrated were sold and many good prospects were developed. Production men displayed a great deal of interest in the latest tools designed to speed up production and reduce manufacturing costs.

Among the larger buyers was the Amtorg Trading Corporation, which had a number of representatives at the exhibit. This company distributed a number of orders for equipment for Russian tractor plants with local and other machine tool manufacturers. Negotiations for considerable other machinery were conducted by this organization, but the final details of sales have not been concluded. A representative of the Amtorg corporation announced that its purchases during the exhibit aggregated $1,200,000, but this probably included some business that has not yet been developed into signed contracts. Orders placed with Cleveland machine tool manufacturers by this corporation included 48 single spindle drilling machines and eight automatic screw machines. An Eastern company received an order for 19 grinding machines.

Acme Refining Co., Cleveland, is erecting cutting oil and grease compounding plant at West Fifty-fifth Street and Wheeling & Lake Erie Railroad, to cost $150,000. Conveying and hoisting equipment will be required.

Plans are being considered by Tyson Roller Bearing Co., 1210 High Avenue, S.W., Canton, Ohio, for one-story addition, to cost about $40,000 with equipment.

Bessemer Securities Co., Youngstown, operating Bessemer Limestone & Cement Co., and other allied interests, has arranged for a new stock issue to total about $600,000, part of proceeds to be used for expansion. Company recently acquired property at Pittsburgh, and is planning for new cement mill.

City Council, Sandusky, Ohio, is contemplating construction of municipal electric light and power plant. C. W. Sadler, City Hall, is city manager.

National Lime & Stone Co., Bluffton, Ohio, will defer rebuilding local plant recently destroyed by fire and will concentrate production at other mills for present time.

Kent Rubber Products Co., Ravenna, Ohio, has awarded general contract to P. L. Frank Construction Co., Ravenna, for two-story mill, 50 x 95 ft., to cost about $45,000 with equipment.

Electric Auto-Lite Co., Toledo, Ohio, manufacturer of automobile lighting and starting equipment, has acquired property at Sarnia, Ont., as site for new Canadian branch plant, to cost more than $3,000,000 with equipment. Company has revised plans for new office and operating building at Toledo, to cost about $200,000. Alfred A. Hahn, Gardner Building, is architect. C. O. Miniger is president.

Osborn Mfg. Co., 5401 Hamilton Avenue, Cleveland, manufacturers of molding machines and foundry supplies, has placed contract with Hunkin-Conkey Construction Co. for a new factory and office building, adjoining present plant, which will increase facilities about 25 per cent.

St. Louis

ST. LOUIS, Oct. 7.—Carter Carburetor Co., 2838 North Spring Street, St. Louis, has awarded general contract to Fruin-Colnon Contracting Co., Merchants-Laclede Building, for two-story addition, to cost about $40,000 with equipment. Martin Engineering Co., Syndicate Trust Building, is architect and engineer.

Mid-West Steel Co., 1533 West Grand Street, Oklahoma City, Okla., has plans for one-story addition, 60 x 128 ft., for storage and distribution, to cost about $25,000 with equipment.

Crystal Ice Co., Mangum, Okla., has plans for ice-manufacturing and cold storage plant, to cost about $85,000 with equipment.

Detroit Aircraft Corporation, Detroit, operating Ryan Aircraft Corporation, St. Louis-Lambert Flying Field, St. Louis, and Parks Aircraft, Inc., East St. Louis, Ill., will consolidate operations of both subsidiaries at last-noted point, and proposed addition for expansion in parts production and assembling of Ryan division, referred to last week, will be carried out at that place, to cost about $90,000. It is purposed to dispose of present Ryan works. E. S. Evans is president of parent organization.

Board of directors, Flanagan Boys' Home, West Dodge, Neb., has awarded general contract to Parsons Construction Co., Grain Exchange Building, Omaha, Neb., for two-story boys' trade school,

to cost about $65,000 with equipment. Lahr & Stangel, W.O.W. Building, Omaha, are architects.

Robinson Supply Co., Tulsa, Okla., recently formed by H. E. Robinson, 205 West Archer Street, and associates, is considering operation of local plant to manufacture pumping equipment and kindred machinery for oil fields.

Locomotive Finished Material Co., Atchison, Kan., has plans for one-story addition, 125 x 400 ft., primarily for production of steel castings, to cost more than $80,000 with equipment.

Topeka Airport & Aviation Co., 1345 Fillmore Street, Topeka, Kan., has filed plans for hangar with repair and reconditioning shop facilities at North Topeka-Oakland airport, to cost about $40,000 with equipment. R. E. Scammell, National Reserve Building, is architect.

Fleetcraft Airplane Corporation, Lincoln, Neb., care of N. A. Sanders, Patterson Building, Denver, is considering plant near municipal airport at Denver for parts manufacture and asembling, to cost about $180,000 with equipment.

South Atlantic

BALTIMORE, Oct. 7.—Julien P. Friez & Sons, Inc., 4 North Cathedral Street, Baltimore, manufacturer of scientific instruments, has engaged Edward H. Glidden, American Building, architect, to prepare plans for new three-story plant, 65 x 100 ft., primarily for manufacture of precision instruments for airplanes, to cost about $100,000 with equipment. Company is a subsidiary of Consolidated Instrument Co. of America, Inc., 41 East Forty-second Street, New York.

Searchlight Metals Mfg. Corporation, Richmond, Va., recently organized, is completing first unit of new plant at Dumbarton, where 3-acre tract has been secured, for production of special alloys, Babbitt metal, type metals and kindred products. It is proposed to establish a second unit at early date for manufacture of copper, brass, and bronze products. Entire project will cost more than $45,000 with equipment.

Smith-Douglas Co., Board of Trade Building, Norfolk, Va., manufacturer of commercial fertilizers, has awarded general contract to J. L. Abbitt, same address, for new one-story plant on 10-acre tract, to cost about $70,000 with equipment.

Washington County School Board, Hancock, Md., is considering installation of manual training equipment in new local high school to cost about $120,000, for which bids on general contract will be asked in about 30 days. Architect for school board is preparing plans; Charles A. Weagly is president.

United States Bobbin & Shuttle Co., Providence, R. I., manufacturer of textile mill equipment, has acquired Jordan Mfg. Co., Monticello, Ga., manufacturer of kindred equipment, with plans at Monticello, Greenville, S. C., and Johnson City, Tenn., and will consolidate. Operations will be continued at present plants, with expansion in output, company to be known as Jordan Division. Charles H. Jordan will be vice-president of purchasing company in charge of Southern operations.

American Oil Co., American Building, Baltimore, has plans for a storage and distributing plant at East Butler, Pa., to cost over $50,000 with equipment. T. J. O'Connell is company engineer.

Bedford Pulp & Paper Co., Big Island, Va., has plans for new power plant to cost over $80,000 with equipment. Headquarters are in Mutual Building, Richmond, Va.

City School Commission, Salisbury, Md., is contemplating installation of manual training equipment in new three-story high school to cost $500,000, for which bids will soon be asked on general contract.

Industrial Electric & Machine Co., 507 East Russell Street, High Point, N. C., is planning erection of one-story foundry, to cost about $30,000 with equipment.

Richmond Coca-Cola Bottling Works, Inc., Richmond, Va., has leased building of Everhart Motor Co., Leesburg, Va., and will remodel for new plant, installation to include elevating, conveying, automatic bottling and other equipment, to cost over $75,000.

Maryland Machinery Co. has been incorporated in State of Maryland to deal in machinery with offices in Snow Building, Calvert and Lombard Streets, Baltimore. New organization, which will operate in Maryland, District of Columbia and parts of West Virginia and Virginia, will have exclusive representation of machine-tool manufacturers located in Middle West and New England. It will specialize in metal-working machinery. Officers are Thomas H. King, president, and W. J. Lippert, secretary and treasurer. Mr. King has long been identified with machine tool industry, and Mr. Lippert has for some years conducted business as a dealer in general machinery in Baltimore.

Detroit

DETROIT, Oct. 7.—Consumers Power Co., 212 West Michigan Avenue, Jackson, Mich., has plans for hydroelectric generating plant near Morley, to cost about $10,000,000 with transmission lines. Stevens & Wood, Inc., 20 Pine Street, New York, is consulting engineer.

Ex-Cell-O Aircraft & Tool Corporation, 1200 Oakman Street, Detroit, manufacturer of tool and precision equipment for airplanes, has superstructure under way on one-story plant unit, 112 x 440 ft., to cost about $100,000 with equipment. Company is considering construction of central power plant.

Sparta Foundry Co., Sparta, Mich., has awarded general contract to Lenger & Kool, 1812 Granville Avenue, S. W., Grand Rapids, for one-story foundry addition, to cost about $35,000 with equipment.

Reynolds Spring Co., Jackson, manufacturer of automobile springs and other automotive equipment, is carrying out an expansion, to include purchase of company in same line of manufacture at Detroit, name temporarily withheld. It is planned to concentrate assembling work at Detroit as soon as merger is completed, and to extend other divisions at Jackson.

Olds Motor Works, Inc., Lansing, is planning addition to automobile engine plant and engineering laboratories, totaling about 35,500 sq. ft. additional floor space, to cost more than $100,000 with equipment.

L. A. Darling Mfg. Co., Bronson, Mich., manufacturer of metal display fixtures, etc., has plans for a two-story addition, to cost about $40,000 with equipment. F. L. Shoemaker, Masonic Block, Sturgis, is architect and engineer. J. D. Spencer is president.

Wayne County Board of Commissioners, Barlum Tower Building, Detroit, will take bids at once for power plant at Middlebelt and Goddard Roads, to cost about $100,000 with equipment. Giffels & Vallet, Marquette Building, are engineers.

Fisher Body Corporation, Detroit, has asked bids on general contract for two extensions to works at Lansing, consisting of one-story addition to factory formerly occupied by Olds Motor Works, Inc., 140 x 250 ft., and new two-story unit, 70 x 450 ft., to cost about $400,000 with equipment. H. E. Beyster, General Motors Building, Detroit, is engineer.

United Brass & Aluminum Co., 3127 Goulden Street, Port Huron, plans early call for bids on two-story addition, to cost about $45,000 with equipment.

Buffalo

BUFFALO, Oct. 7.—Plans are under way by Buffalo, Niagara & Hudson Power Corporation, Electric Building, Buffalo, for another unit at local steam-operated generating plant, to cost about $1,000,000 with power switching station and other facilities.

Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks, has awarded general contract to Robert E. Williams & Son, Inc., Jackson Building, for one-story addition, 100 x 250 ft., for parts production and service, to cost $55,000 with equipment. North & Shelgren, Crosby Building, are architects.

Excel Metal Cabinet Co., Falconer, N. Y., will soon begin superstructure for one-story addition, to cost about $40,000 with equipment, for which general contract recently was let to Paddock & Nash, Phillips Building, Jamestown, N. Y.

Buffalo Electric Furnace Corporation, Buffalo, care of William G. Shoemaker, Jr., 35 Knox Avenue, recently formed by Mr. Shoemaker and associates with capital of $200,000, is planning early operation of local plant to manufacture electric furnaces, including parts and assembling departments.

Samson-United Corporation, Rochester, N. Y., has been organized to take over and succeed to local plant and business of Samson Cutlery Co., 8 Jones Street, manufacturer of shears, curling irons and kindred products. New organization is planning expansion in present facilities and is said to be contemplating new unit in near future.

American-LaFrance Foamite Corporation, Elmira, N. Y., manufacturer of motor-driven fire engines and trucks, motorized fire-fighting equipment, etc., has awarded general contract to John Cunningham, 103 South Avenue, for one-story addition, to cost about $55,000 with equipment. Haskell & Considine, Hulett Building, are architects.

Hyatt C. Hatch and Henry J. Neufang, Atlanta, N. Y., have organized Boggs Plow Co., with capital of $100,000, to operate local plant for manufacture of plows and other agricultural tools.

Philadelphia

PHILADELPHIA, Oct. 7.—Plans have been filed by Philadelphia Rapid Transit Co., Mitten Building, Philadelphia, for one-story mechanical shop, to cost about $30,000 with equipment.

Almar Stores, Inc., 925 North Front Street, Philadelphia, plans installation of traveling ovens, power equipment, conveying and other machinery in new two and three-story baking, storage and distributing plant, to cost more than $300,-

000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Reading Co., Reading Terminal, Philadelphia, has awarded general contract to Arey-Hauser Co., Elverson Building, for one-story electric car repair shop, to cost about $225,000 with equipment.

Belmont Packing & Rubber Co., Butler and Sepviva Streets, Philadelphia, manufacturer of mechanical rubber goods for power plants, has work under way on rebuilding four-story plant recently destroyed by fire, to cost more than $100,000 with equipment.

Philadelphia Suburban Water Co., Jenkintown, Pa., is disposing of bond issue of $2,500,000, part of fund to be used for expansion and improvements in pumping plants and power facilities, piping systems, etc.

I. Fischman & Sons, Inc., Tenth Street and Allegheny Avenue, Philadelphia, manufacturers of soda fountains and equipment, has acquired John J. Deery Co., 373 Vernon Avenue, Long Island City, N. Y., marble and stone products, and will consolidate with its marble-working division in new plant now under way on local site, to cost about $1,500,000, operating under name of Consolidated Marble Co., recently organized as a subsidiary. Purchasing company will carry out expansion in marble-working department.

School Board of Kennett Square, Pa., is considering installation of manual training equipment in junior and senior high school to cost $700,000, for which plans will be drawn by E. William Martin, du-Pont Building, Wilmington, Del., architect.

Hercules Powder Co., Wilmington, Del., has acquired 300-acre tract near city limits as site for new experimental and research plant, to cost more than $400,000 with equipment. It is proposed to remove plant at Kenvil, N. J., to new location, following completion of buildings.

J. D. Johnson Co., Inc., 139 North Seventh Street, Philadelphia, plumbing equipment and supplies, has leased building at Freehold, N. J., for new factory branch and distributing plant.

Chicago

CHICAGO, Oct. 7.—Sales of machine tools are moderate. Fresh inquiries fall short of the volume of recent weeks, partly due to the attendance of many prospective buyers at the machine tool exposition at Cleveland. Reports from Cleveland are so favorable, from the viewpoint of sales and of general interest, that the local trade is preparing for active purchasing the remaining weeks of the month. Old inquiry, much of which is alive, bulks large and lends support to those who anticipate an active late fall trade. Requests for good used equipment are more numerous than the machines available and prices are high. The Chicago, Milwaukee, St. Paul & Pacific has placed orders for two frog and switch planers.

Northern States Power Co., Granite Falls, Minn., has started construction of a new power plant, to cost $2,500,000.

Kari-Keen Mfg. Co., Sioux City, Iowa, has let contract for one-story addition, 88 x 268 ft., which will add 25,000 sq. ft. to factory space and provide capacity for 1200 auto carrier and luggage units daily. New unit will cost $50,000 and is fifth addition company has made this year. Cecil H. Myers is president and general manager.

Sterling Mfg. Co., 1410 Wrightwood Street, Chicago, manufacturer of radio equipment and parts, has awarded general contract to A. Nelson, 2432 Irving Park Boulevard, for one-story addition, to cost about $50,000 with equipment. A. H. Durr & Co., 123 West Madison Street, are architects.

Crane Co., 836 South Michigan Avenue, Chicago, has awarded general contract to Oscar Sandstrom, 28 North Genesee Street, Waukegan, Ill., for one-story factory branch and distributing plant, 108 x 159 ft., at Waukegan, to cost about $55,000 with equipment. C. W. Webster is company architect.

Canadian-American Lines, Inc., 2600 Delaware Street, Minneapolis, Minn., Norman G. Warsinske, head, is considering establishment of airport, including hangars, repair shop, oil storage and other field units, to cost about $175,000 with equipment.

Chicago, St. Paul, Minneapolis & Omaha Railway Co., East Fourth Street, St. Paul, Minn., has awarded general contract to J. B. Nelson Construction Co., Mankato, Minn., for new engine house at Mankato, with repair and servicing facilities, to cost $55,000 with equipment.

North American Car Corporation, 327 South La Salle Street, Chicago, has arranged for increase in capital from 123,874 to 138,261 shares of stock, totaling about $600,000, part of fund to be used for expansion in production facilities.

Iowa Public Service Co., Sioux City, Iowa, is considering new steam-operated electric generating plant at Audubon, Iowa, to cost over $60,000 with equipment. A similar power station is planned at Ida Grove, Iowa, to cost close to like sum.

J. L. Shiely, Builders' Exchange, St. Paul, Minn., will build a sand and gravel washing, storage and distributing plant at Verendrye, N. D., including elevating, conveying, loading and other mechanical equipment. A power plant also will be constructed, entire project to cost about $125,000.

Kennedy Mfg. Co., Streator, Ill., is considering plans for the rebuilding of part of motor truck body manufacturing plant recently destroyed by fire.

Milwaukee

MILWAUKEE, Oct. 7.—Pending machine tool business is ahead of that in the corresponding weeks of August and September, although in most cases purchasing has been postponed until after the Cleveland show. Inquiries are increasing. While manufacture of agricultural implements has fallen off in some districts in Wisconsin, leading Milwaukee plants are expanding production facilities. Local and nearby automobile factories of the Nash Motors Co. have resumed quantity production on new models. Although Milwaukee employment figures are slightly lower than those of the preceding month they are higher than a year ago and there is no surplus of skilled machinists.

Chain Belt Co., Sivyer Steel Casting Co., Federal Malleable Co. and Interstate Drop Forge Co., all of Milwaukee, and Stearns Conveyor Co., Cleveland, have entered into a joint marketing arrangement. Hibbard S. Greene, assistant to President C. R. Messinger of Chain Belt Co., and formerly vice-president and director of Barber-Greene Co., Aurora, Ill., will be in charge.

Giddings & Lewis Machine Tool Co., Fond du Lac, Wis., is completing an addition, 90 x 225 ft., to be used principally for erecting. Present space used for this purpose will be devoted to production.

Racine Tool & Machine Co., Racine, Wis., is transfering its plant to building recently purchased, at State Street and Carlisle Avenue, and plans expansion.

Atlas Engineering Co., Clintonville, Wis., manufacturer of tractors, hoists, conveyors and other contractors' steel equipment, is contemplating plant extensions.

Board of Education, Williams Bay, Wis., has plans for an addition to high school, 57 x 101 ft., to include vocational training department. Edward Tough, 119 East Washington Avenue, Madison, Wis., is architect.

Board of Education, Racine, Wis., has plans by Frank J. Hoffman, architect, James Block, local, for first unit to vocational training school, three-stories, 68 x 128 ft.

City of Oconto, Wis., has retained Gordon & Bulot, engineers, 53 West Jackson Boulevard, Chicago, to design improvements to cost about $40,000 for city water plant, to include new electrically operated, deep well pumps, elevated steel tank, tower and standpipe.

Crucible Steel Casting Co., Fifteenth Avenue, Milwaukee, has begun construction of warehouse addition, one-story, 30 x 140 ft.

A. O. Smith Corporation, Milwaukee, will proceed with plans for eight story administration and science building as result of city's relaxation of zoning restrictions. E. W. Burgess, general plant engineer, is taking bids for new factory unit 200 x 270 ft., about 140 ft. high and is supervising designs for science building.

Pittsburgh

PITTSBURGH, Oct. 7.—Machine tool sales were rather light the past week, with nearly all buyers and sellers in this district attending the machine tool show at Cleveland. However, new inquiry was not entirely lacking and the market is anticipating railroad buying in the near future. Both the Chesapeake & Ohio and the Norfolk & Western are expected to issue lists soon and the Westinghouse Electric & Mfg. Co. is bringing out its fourth quarter list. Inquiries for individual tools are also coming out regularly and prospects for fall buying are considered very satisfactory.

Steel works buying of heavy machinery and equipment continues and local mills are figuring on a number of projects. Sales of shears for scrap yards have been very heavy this year. A Butler, Pa., yard recently contracted for four No. 2, two No. 2 and one No. 1 Canton shears and at least two other yards in this district have ordered equipment recently.

Work has been started by Tarentum Steel Corporation, Tarentum, Pa., on initial units of new mill, on site of former plant of Pittsburgh Plate Glass Co., for production of iron and steel products, to cost more than $1,000,000. Company was formed recently by William Cole, 1125 Park Street, and Frank C. Irvine, 128 East Eighth Street, Tarentum, and Pitts-

burgh interests identified with Pittsburgh Steel Foundry Co., Glassport. Mr. Irvine is treasurer.

Board of Trustees, Polk State School, Polk, Pa., has plans for extensions and improvements in steam power plant, to cost about $75,000 with equipment. J. N. Chester, Clark Building, Pittsburgh, is engineer.

General Motors Corporation, Detroit, has awarded general contract to Rust Construction Co., Koppers Building, Pittsburgh, for one and two-story parts and service building, 145 x 215 ft., at Pittsburgh, to cost about $150,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Mesta Machine Co., West Homestead, Pittsburgh, manufacturer of rolling mill machinery, etc., has disposed of a stock issue to total $3,120,000, part of fund to be used for expansion.

Appalachian Electric Power Co., Bluefield, W. Va., a subsidiary of American Gas & Electric Co., 30 Church Street, New York, is said to be planning extensions in steam-operated electric power plant at Logan, W. Va., including installation of additional equipment, to cost more than $450,000.

Carnegie Forge & Tool Co., Commonwealth Building, Pittsburgh, is considering plans for new one-story factory, to cost more than $50,000 with equipment.

Cornelius Engineering Corporation, Pittsburgh, care of Albert Bruckman, 1144 Biltmore Street, treasurer, recently formed by Mr. Bruckman and associates, is planning early operation of local factory to manufacture heating and ventilating equipment and air conditioning apparatus. Paul F. Seibold, 1025 Chislett Street, is interested in new organization.

Gulf States

BIRMINGHAM, Oct. 7.—Oneonta Forge & Screw Co., Inc., Oneonta, Ala., has plans for extensions and improvements, with installation of equipment for production of light forgings, including harrow teeth, turnbuckles, etc.

Scobey Fireproof Storage Co., 315 North Medina Street, San Antonio, Tex., will take bids in November for four-story cold storage and refrigerating plant, 90 x 180 ft., to cost about $300,000 with equipment. Engineering Service Corporation, Post-Dispatch Building, Houston, Tex., is engineer.

Pantex Pressing Machine Co., 2306 Isabella Street, Houston, Tex., is considering new local plant, to cost about $60,000 with equipment.

Southern Union Gas Co., San Antonio, Tex., is planning construction of natural gas pipe line from McCamey, Tex., to Taylor-Link field, about 15 miles, to cost about $100,000 with booster stations, etc.

Otto F. Zangen, Davenport, Fla., will erect new plant at Davenport Terminals for manufacture of sectional houses, to cost about $30,000 with equipment. Latter will include woodworking equipment, bending, punching, shearing and other tools.

Alfred C. Finn, Houston, Tex., architect, has plans for five-story automobile service, repair and garage building, 103 x 250 ft., to cost about $300,000 with equipment.

Texas Gulf Sulphur Co., Gulf, Matagorda County, Tex., has acquired rights to sulphur properties of Gulf Production Co., an interest of Gulf Oil Co., at Long Point. It is planned to remove mining machinery from Big Creek to new location, and install additional equipment. Project will cost more than $150,000.

Houston Armature Works, Inc., 4 Preston Avenue, Houston, Tex., manufacturer of electrical equipment, has asked bids on general contract for four-story plant, 100 x 150 ft., to cost about $50,000 with equipment. Einar H. Stubee, 3940 Main Street, is architect.

Birmingham Stove & Range Co., Birmingham, is planning extensions to cost more than $40,000 with equipment.

Parkersburg Rig & Reel Co., 6300 Navigation Boulevard, Houston, Tex., manufacturer of oil well machinery, drilling equipment, etc., with main plant at Parkersburg, W. Va., has acquired additional property and is considering new local factory branch and distributing plant, to cost over $35,000 with equipment.

Cincinnati

CINCINNATI, Oct. 7.—Fresh bookings by machine tool manufacturers in this district were greater last week than in the preceding week, adding further to the large amount of unfilled orders. Production is being maintained at capacity, with indications that this rate will continue for the remainder of the year. The market reflects an easing in demand for lathes and lighter tools, while planers and heavier machines are still active. General inquiry, however, is fairly brisk.

Chicago, Milwaukee, St. Paul & Pacific placed an order with a local manufacturer for two large planers. Chevrolet Motor Car Co. and a Massachusetts buyer have ordered one planer each.

Cincinnati Grinders, Inc., 3058 South Avenue, Cincinnati, manufacturer of grinding machines, parts, etc., is considering one-story addition, to cost about $70,000 with equipment.

Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, has plans for one-story addition to mill at Alcoa, Tenn., about 100 x 360 ft., for storage and distribution, to cost more than $75,000.

Allen Mfg. Co., Tenth Avenue, North, Nashville, Tenn., manufacturer of stoves, ranges, etc., has engaged Robert & Co., Inc., Bona Allen Building, Atlanta, Ga., architect and engineer, to prepare plans for one-story plant at Franklin, Tenn., totaling about 150,000 sq. ft. floor space, to cost about $200,000 with equipment.

Board of Education, Van Buren Township, Dayton, Ohio, care of Walker & Norwick, American Building, architects, plans installation of manual training equipment in new high school to cost $300,000, for which bids are being asked on general contract until Oct. 18.

Buckeye Cotton Oil Co., Gwynne Building, Cincinnati, a subsidiary of Procter & Gamble Co., same address, has awarded contract to Virginia Bridge & Iron Co., Roanoke, Va., for one and three-story and basement mill at Memphis, Tenn., 50 x 420 ft., largely for pulp manufacture, to cost about $200,000 with equipment. Robert & Co., Inc., Bona Allen Building, Atlanta, Ga., is architect and engineer.

Indiana

INDIANAPOLIS, Oct. 7.—American Metal Furniture Co., 325 West Seventeenth Street, Indianapolis, Stanley Brooks, secretary, has plans for one-story plant, 150 x 200 ft., to cost about $70,000 with equipment. Mothershead & Fitton, 960 North Pennsylvania Street, are architects.

Gordon Body Co., 306 North Talbott Avenue, Indianapolis, manufacturer of automobile bodies, has awarded general contract to Godsey & Case Co., Mooresville, for one-story plant, 100 x 160 ft., to cost about $75,000 with equipment.

Officials of Indiana Limestone Co., Bedford, have organized Texas Quarries, Inc., a subsidiary, to purchase and operate about 4000 acres of limestone properties near Austin, Tex. A quarry plant will be installed and one-story finishing mill constructed, with machine shop, boiler house and auxiliary units, to cost about $240,000 with equipment.

Northwestern Terminals, Inc., 226 Water Street, Evansville, plans early call for bids for a new coal storage, handling and distributing plant, to cost $100,000 with machinery. Vonnegut, Bohn & Mueller, Indiana Trust Building, Indianapolis, are architects and engineers.

Cord Corporation, Auburn, recently organized by officials of Auburn Automobile Co., Auburn, headed by E. L. Cord, president, is concluding negotiations for purchase of Stinson Aircraft Corporation, Wayne, Detroit, and will operate as a subsidiary. Plans are under way for expansion.

Pacific Coast

SAN FRANCISCO, Oct. 3.—Northrup Co., Burbank, Cal., has awarded general contract to Austin Co. of California, Inc., Los Angeles, for one-story aircraft manufacturing plant, including parts production and assembling, to cost about $50,000 with equipment.

Pacific Gas & Electric Co., 425 Market Street, San Francisco, will erect equipment storage and distributing plant, with mechanical and electrical repair departments, to cost about $100,000 with equipment.

United States Metal Products Co., 330 Tenth Street, San Francisco, will soon call for bids on general contract for one and two-story plant, considerable portion to be given over for storage and distribution, to cost about $100,000 with equipment. Ellison & Russell, Pacific Building, are architects and engineers.

Victor Talking Machine Co., Los Angeles, with main plant at Camden, N. J., has awarded general contract to Austin Co. of California, Inc., for one-story addition, 90 x 165 ft., to cost about $45,000 with equipment.

Fir-Tex Insulating Board Co., Pacific Building, Portland, has plans for group of one-story units at St. Helens, Ore., including digester plant, shredder shop, board-forming mill, finishing mill, power plant and other buildings to cost about $2,000,000 with equipment.

Lysall Welding Works, Inc., Port Angeles, Wash., has awarded general contract to Eric Anderson & Sons, Inc., Port Angeles, for one-story plant, 50 x 140 ft., to cost about $28,000 with equipment.

Everett Pulp & Paper Co., Everett, Wash., is considering construction of one-story machine shop, with woodworking department, to cost about $30,000 with equipment.

Illinois Electric Co., Los Angeles, has leased two-story factory to be erected at 912 East Second Street, for new plant to manufacture electrical specialties, to cost about $30,000 with equipment. John M. Cooper, Rives-Strong Building, is architect.

National Ice & Cold Storage Co., Postal Telegraph Building, San Francisco, will soon begin construction of one-story cold storage and refrigerating plant at Hol-

lister, Cal., to cost about $200,000 with machinery. Engineering department of company is in charge.

Canada

TORONTO, Oct. 7.—Machine tool sales for September showed about a 10 per cent gain over those for the previous month. New business is being received in good volume and the general outlook is bright. Small lists are appearing, and there is a steady flow of orders for two or three tools to a customer. The automotive industry is buying for replacement, but otherwise demand from this source is limited. Railroads are purchasing in small lots and demand is good from locomotive and car building companies.

Robert Mitchell Co., Ltd., St. Laurent, Que., is building brass and iron foundry departments in connection with its plant, and will have addition ready for operation by Jan. 1. Company expects to go more extensively into manufacture of special alloy castings.

Dominion Wood Pipe Co., Ltd., recently incorporated, has secured a site at LaSalle, Que., for erection of a manufacturing plant. R. L. Calder, 159 Craig Street West, Montreal, is interested.

Kroehler Mfg. Co., 552 Ontario Street, Stratford, Ont., will start work immediately on erection of a furniture manufacturing plant at Montreal, to cost $100,000.

S. C. Johnson & Co., Ltd., Frank Street, Brantford, Ont., manufacturer of cement, contemplate erection of a $50,000 addition.

Canadian Industries, Ltd., 1050 Beaver Hall Hill, Montreal, has awarded contract to Fraser-Brace Engineering Co., 107 Craig Street West, for a factory and storage building at Copper Cliff, Ont., to cost $2,000,000.

Foreign

WORK is under way by Mexican Eagle Oil Co., Minatitlan, State of Nuevo Leon, Mexico, on an expansion program at local refinery, to include installation of new equipment. Company is also planning early construction of pipe lines from Tonala field, Isthmus of Tehuantepec, to refinery site, entire project to cost over $200,000.

Societa Adriatica di Eletricita, Milan, Italy, operating electric light and power properties, will increase capital from 250,000,000 to 400,000,000 lire, part of proceeds to be used for extensions in plants and system.

Donugol Coal Trust of Soviet Russian Government, Moscow, has signed an agreement with Allen & Garcia Co., 332 South Michigan Avenue, Chicago, consulting engineer, for technical assistance in development of coal properties, particularly in connection with installation of new plants in the Donetz Basin and Siberia territories. American equipment will be largely used. It is proposed to increase coal output in Soviet Union from 35,000,000 to 75,000,000 tons during next four years. Amtorg Trading Corporation, 261 Fifth Avenue, New York, is official buying agency.

American Smelting & Refining Co., 120 Broadway, New York, is carrying out an expansion at plant at Monterey, State of Nuevo Leon, Mexico, including installation of equipment, to cost more than $250,000.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

NAVAL establishments were discussed by President Hoover and Prime Minister MacDonald, the first personal conference ever held between chief executives of America and England . . . Invitations will be issued to a general parley on naval limitation in London next January.

* * * * *

INTERNATIONAL trade will be so badly upset by higher American tariffs, that the pending law will be a world-wide issue, in the press' opinion in Chile and Argentine Republic. However the export duty per ton of flaxseed from the latter has increased from 31c. in July to $3.88 for this month . . . Cuba Cane Sugar Corporation, the largest producer of raw sugar in Cuba, becomes insolvent from the combined effect of governmental restriction of output and a low wholesale price . . . J. H. Thomas, British Minister of Employment, says he convinced large Canadian consumers of steel and coal that they should buy from English firms rather than American.

* * * * *

INDUSTRIAL output, on the average, is still at a steady rate, somewhat higher than a year ago. Low spots are noticeable in automobiles, residential construction, radio and textiles. However freight car loadings continue high, insolvency statistics for the third quarter show a sound condition of business and fifty manufacturers of machinery and equipment net 43 per cent more in first half of 1929 than in 1928 . . . The general decline in the stock market is nowhere attributed to unfavorable industrial news.

* * * * *

EMPLOYMENT and retail trade are as good as the season warrants, and are unusually good in some regions. For instance, a gain of 10 per cent in payrolls over last year is reported in the Philadelphia district, and shoe business in St. Louis experienced a record business in September. Southern states have generous tobacco and cotton crops, and a good price for the latter.

Airport Passenger Depots Planned

Terminals, Similar to Those Operated by Railroads, Will Provide for Comfort, Safety and Convenience of Air Travelers

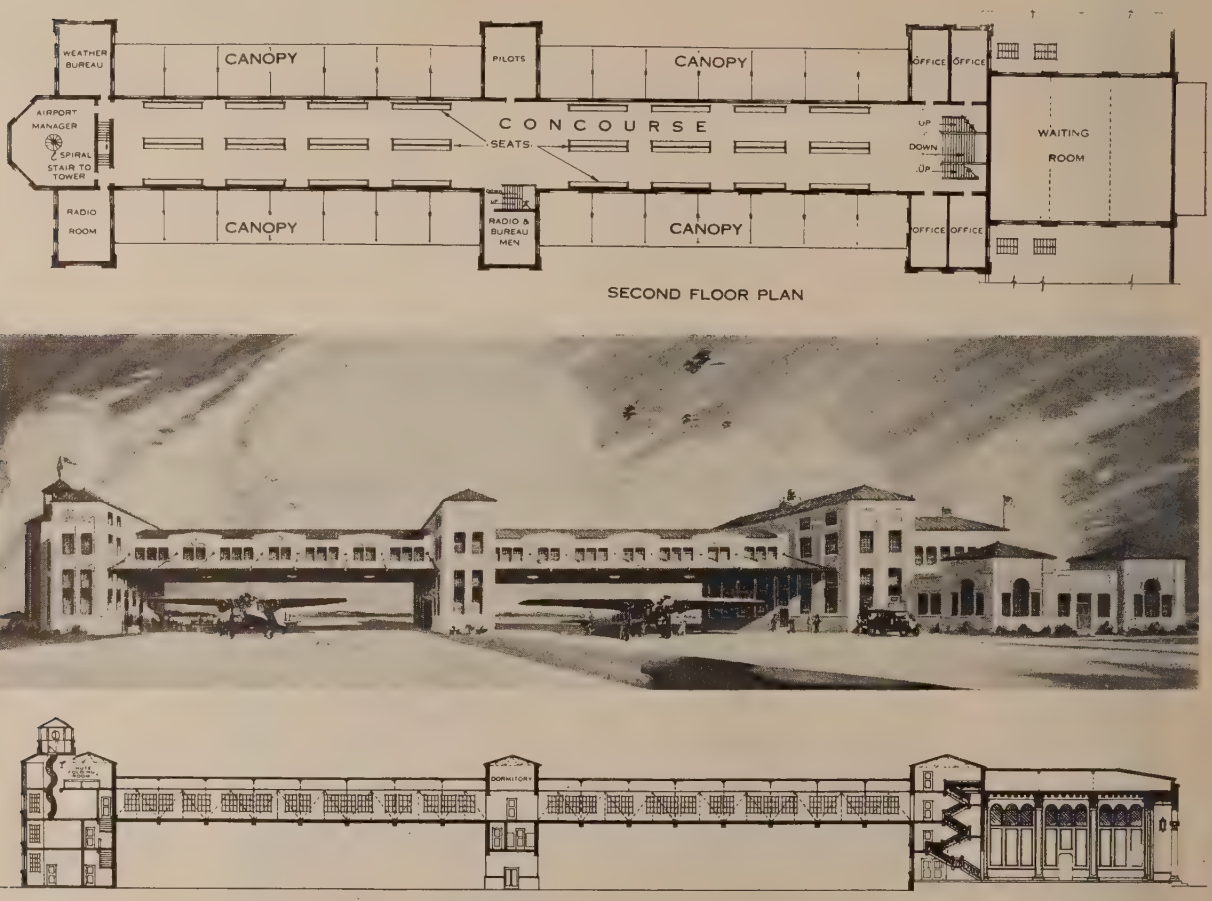
WITH the rapid increase in air transportation is coming the development of terminal facilities at airports that will provide safety, comfort and convenience for passenger traffic. It was not long ago that airports with few exceptions were little more than landing fields. It is only two years ago that a waiting room and ticket office for airplane passengers, which was said to be the first to be built in this country, was erected at the Ford Airport at Dearborn, Mich. Since then, airport building has been going on at a rapid rate and the number of airports in this country is now said to exceed 1500, but provision for adequate passenger terminals is still in its infancy.

The tremendous increase in the building of commercial airplanes, the large amount of new capital that has been put in this industry during the past year and the recent tying up of rail and air transportation by some of the larger railroads by providing part rail and part airplane transportation from coast to coast are indications that the carrying of passenger traffic by airplanes is getting well beyond its experimental stages and that the general public is learning to accept the airplane as a convenient and safe method of transportation. Air travel has shown remarkable growth in this country in the past two or three years, which doubtless is partially due to the building of larger and safer planes and the provision of comforts for passengers. The country is now overlaid with a network of air lines from coast to coast.

A COMBINATION Air-Rail-Water Passenger Terminal, as Conceived by the Austin Co., Cleveland, for Handling Airplane, Rail, Steamboat and Amphibian Plane Traffic

While there have been developments in the construction of airports, so far they have had to do largely with requirements growing out of the operation and maintenance of air-

craft or the necessities of companies operating planes. These include more convenient as well as larger hangars to accommodate the larger planes now being built, repair shops, rooms for the weather bureau and radio operating offices and better lighting facilities. Hangars have been improved in design and in architectural appearance. However, little attention has been given to providing for the comforts, safety and convenience of air travelers with adequate passenger terminals. While a few principal airports have passenger depots and comfortable waiting rooms, it is claimed that most of the existing airports are nothing more than open fields. The lack of terminal provision for air travelers, it is pointed out, is in sharp contrast with the safety features and provision for comforts in the newer types of passenger planes.



AIR Depots Will Have Covered Loading Areas Where Passengers Can Board Planes Conveniently in Bad Weather. Design of the air depot of the future as viewed by the Austin Co. is shown in the accompanying layout. Ample space is provided for waiting passengers and the covered areas where planes will be loaded.

Engineers Planning Passenger Terminals

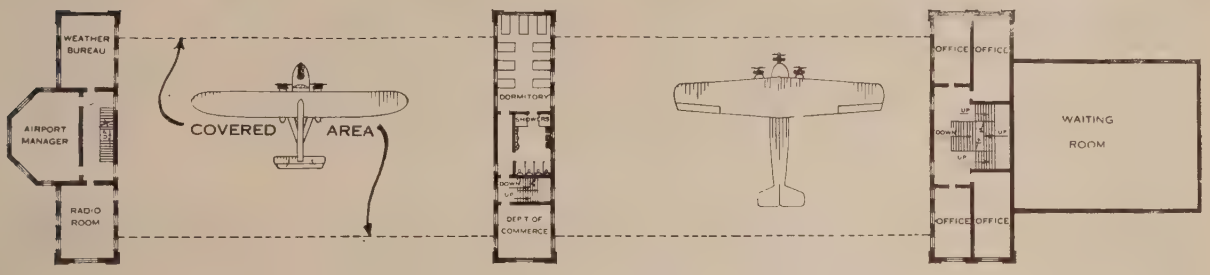
Competent airport engineers have not played an important part in the development of airports as they exist today, but are now being consulted to provide more adequate passenger terminal facilities, which, it is believed, will result in a marked increase in airplane passenger business. While a few airport depots have convenient waiting rooms, few if any have a system of traffic control similar to that at a large railroad terminal. Passengers in good weather and bad still embark and alight on the airport field, which not infrequently is muddy, and face the hazard of whirring airplane propellers.

The air depot of the future, as conceived by some engineers who have long been engaged in building airports and hangars, will follow closely the methods of modern railroad terminals in handling traffic. Passengers will go through the depot to concourses that will take them to waiting planes, which they will enter without leaving cover. Such a depot will consist of artistically designed two-story building units connected by steel bridges which will serve as concourses, the buildings themselves serving as piers for the spans of covered concourse bridges. The space beneath the spans and between the piers will form covered loading areas for the planes. When a passenger arrives at the depot, he will enter the waiting room under a marquee at the entrance, purchase his ticket and go to the passenger concourse on the mezzanine floor. When the plane is announced, he will descend a stairway built in one of the piers and walk across a portable railed-in passageway similar to a ship's gangplank and through the open door of the plane directly to his seat. A variation from this plan is to have a passageway in the form of subways underground instead of building overhead bridges.

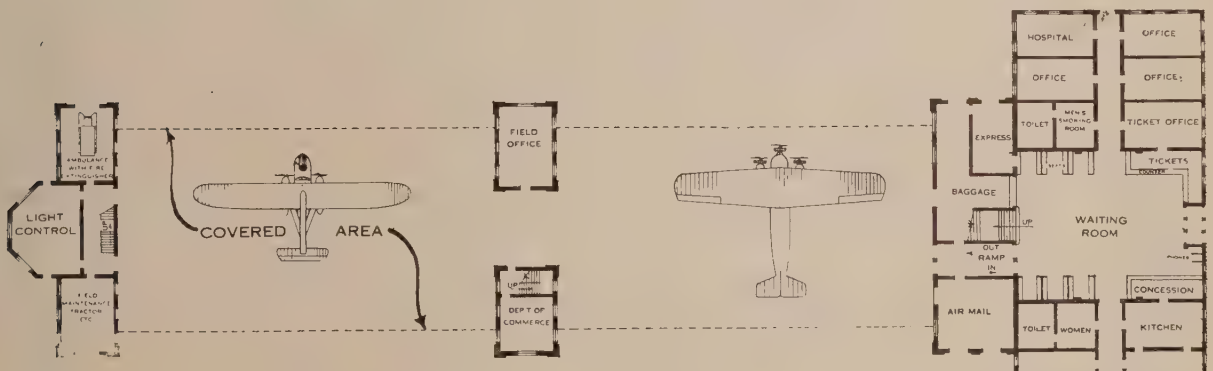
In addition to having a waiting room, the main building will have rooms for ticket and other offices, baggage room, restaurant and rooms for various other purposes. The small pier buildings will provide room for radio equipment, light control, dormitories for field pilots and rooms for other uses. This general plan, of course, is subject to various modifications in detail.

An airplane hangar designed and built recently by

THE Entrance, as Well as Other Parts of the Air Terminal, Will Closely Resemble That of a Railroad Depot



MEZZANINE FLOOR PLAN



FIRST FLOOR PLAN

CANTILEVER Type of Roof Truss Is Used in Cleveland Airport Hangar of National Air Transport, Inc. Because of the almost complete absence of columns, this hangar provides large clear spans and wide door openings

the Austin Co., Cleveland, at various locations, has a cantilever type of roof truss. Because of the almost complete absence of columns, this type provides large clear spans and wide door openings. Roof trusses are carried on the structural steel frame which supports the entire load. Hangars with this roof design can be built with door openings of unlimited width.

The horizontal top and bottom chords for the carrying trusses are built of H-sections, angles or channels, depending on the span, and consequently the stress. They are placed on 30 to 40-ft. centers. The web members can be of angles, H-sections or channels. Cantilever trusses, the outer ends of which are unsupported, are placed at right angles to the carrying trusses. They are fabricated of angles and are placed on 20-ft. centers. The roof purlins span the cantilever trusses and are placed on 8-ft. centers. They are made of 6x12 in. yellow pine on which is laid a 2-in. wood deck. In case a steel plate deck is desired, steel channels are used for purlins. In designing this type of hangar, the Austin Co. has applied its standard building design to the construction of hangars.

Side walls are brick below the sill line. Above the window sills, continuous windows of steel sash extending up to the roof trusses are usually provided. If any portion of the hangar is partitioned for small rooms, the partition walls may be of metal or brick.

Various Types of Hangar Doors Used

Various types of hangar doors are in use. There are different kinds of steel sliding doors built in sections usually with glass in the upper part, steel rolling doors and a cantilever type of door which is a recent development. This type is opened by raising it outward from the bottom and when open provides a canopy sheltering the entrance to the hangar. It is built in sections that are motor-operated independently or together. One, any number of or all the door sections can be operated in approximately one minute. This door is built of structural steel and plates and has large panels of steel sash.

The airport depot of the future, if some of the present elaborate plans materialize, will result in considerable increased demand for steel in this field. A passenger terminal of the proposed type, with structural steel bridges for concourses, will require up to 1000 tons or more of steel, depending on the size, and additional steel will be needed for ornamental stairways, passageways and various mechanical equipment.

Effect of Scrap on Operating Costs of Open-Hearth Steel

EXTENSIVE experiments have been made in Germany, on an actual operating scale, for studying the effect of particular grades of scrap in operating costs.

An open-hearth furnace is charged with a grade of scrap, and the manganese consumption, hot-metal additions, lime needed, time of melt, etc., are noted. On the basis of a fixed price for pig iron, the prices of the scrap are then adjusted to yield a constant operating cost per ton of steel made. Because open-hearth costs depend, to some extent, on the quality of the scrap, the Association of German Ironmasters made the instigation with the cooperation of several German plants. The results in brief, as reported by the London *Iron and Coal Trades Review*, are as follows:

In the experiments made by Ernst Kerl at the Vereinigte Stahlwerke at Hontrop, on two 120-ton tilting furnaces, the following grades of scrap were used:

(1) Block scrap, about 6x5x20 in., weighing about 180 lb.
(2) Clean sheet, bundled, about 36.5x30x30 in., weighing about 2,204 lb.
(3) Detinned sheet, bundled, about 18x16x6 in., weighing 176 lb.
(4) Clean steel turnings.
(5) Partly rusted steel turnings.
(6) Bought steel scrap.

The results of the experiments, consisting of eight heats in the case of scraps (1), (2), (3) and (6), and two heats in the case of (4) and (5), are shown in Table I. The two furnaces were fired with a mixture of coke-oven gas and blast-furnace gas.

On the basis of the data, the value of the different grades of scrap was determined, and the prices then fixed to yield a constant operating cost. The results of such an evaluation are to be seen in Table II (applied to German practice). Clean unrusted steel turnings, at a price of 54 marks a metric ton at a pig iron price of 65 m. per ton, are used as the basis for this calculation. With a pig iron price of 74 m. per ton, the cost of the clean scrap was not to exceed 51 m., and with pig iron at 90 m. per ton, the clean scrap had to be as low as 46 m.

Table II.—Price of Scrap, Marks per Ton

Pig Iron Per Ton	65 Mks.	74 Mks.	90 Mks.
(5) Rusty turnings	51.50	48.50	44.50
(3) Detinned sheet	49.50	42.00	29.50
(2) Clean sheet	56.00	51.50	44.50
(6) Steel scrap	56.00	52.50	46.00
(1) Block scrap	58.50	56.00	52.00

The pig iron was, whenever possible, charged into the open-hearth furnace in a molten state, and was of the following average analysis: C, 4.42; Si, 0.57; Mn, 3.77; P, 0.138; S, 0.03; and Cu, 0.15 per cent. The scrap was nearly throughout mild steel carrying about 0.08 per cent carbon, and 0.40 per cent manganese, except the turnings which had a carbon content of 0.25 per cent and 0.68 per cent Mn.

Table I.—Effect of Various Grades of Scrap on Open-Hearth Results

Kind of Scrap	(1)	(2)	(3)	(4)	(5)	(6)
Metallic charge, per cent	78.34	66.68	55.26	74.40	77.04	70.68

Cold-Heading and Thread Rolling

Characteristics of Steel Wire Best Suited to These Methods in Making Bolts, Screws and Rivets

BY FRED R. DANIELS*

GROWTH of the "cold process" as a means of manufacturing bolts, screws, rivets and other headed and threaded parts has been due as much to metallurgical research in steel making as to the development of automatic high-speed machinery. It is fully appreciated by many manufacturers that the process is faster than any other method for making bolts, screws and rivets of ordinary commercial sizes, and in most cases superior.

Such skepticism as once existed regarding the practicability of producing high-quality threaded work, for example, by rolling is now largely dispelled. In fact, thread rolling is generally conceded to be unsurpassed for producing screws of accurate thread form and lead. At least one reputable manufacturer employs the process for making the calipering screws of micrometers, which in itself is ample proof of the merits of the process.

It is true, however, that difficulty is liable to be experienced in producing both cold-headed blanks and rolled threads, if the physical qualities of the wire best suited for cold forging are not taken into account. It is the purpose of this article to deal briefly with this important subject.

Ordinary basic open-hearth steel of low carbon content is best adapted for cold heading, because it can be worked extensively without "crystallizing." Basic Bessemer steel is suitable also, although it has a comparatively short fibrous structure, which makes it more difficult to head, but easier to drill. Bessemer steel is, therefore, best for hollow rivets.

The wire is made from hot-rolled bar stock and cold drawn through dies which finish it to within plus or minus 0.002 in. of the desired size. It is furnished in coils up to 200 lb. in weight and should be wrapped in paper, or burlap with a tar paper covering, to prevent oxidation and corrosion, and should be stored in a dry place.

Importance of Adequate Drawing

Drawing the wire is of utmost importance, especially when producing wire that is to be threaded. The hot-rolled stock has an open, fibrous structure which is not suitable for thread rolling and which is liable to cause split threads and rough, irregular edges, particularly when rolling sharp V-threads.

If these conditions appear in thread rolling, it is quite evident that the wire was not drawn enough; that is, the hot-rolled bar from which the wire was drawn was too near the wire diameter, to start with. Drawing closes the open, fibrous structure of the rod, thereby refining the metal. When properly drawn and thoroughly annealed this wire is best suited for thread rolling.

Wire Finish for Bolts, Screws and Rivets

The finish of the wire is also important. Bright finished wire, which is the product resulting from drawing lime-coated stock that has not been subjected to a metallic bath, is suitable for machine bolts and similar work, and generally is not annealed. For such work as carriage bolts having large-diameter thin heads, and square corners upset underneath the head, the wire must be thoroughly annealed after drawing, and cleaned. If the wire is not dead soft these corners will not fill out in heading.

Liquor-finished wire is especially popular for work of high-quality finish, such as cap screw, machine screw and rivet blanks of medium and short lengths, generally made on solid die headers. The finish of this wire is the smoothest obtainable. The liquor is a copper sulphate wash which deposits a coating similar to copper, but which finishes harder than copper-coated stock. The coating fills in all seams and pores on the surface of the wire, with the result that the heading dies wear less and last a great deal longer.

Copper-finished wire, also, is used for cold heading, although not so extensively as the liquor finish. The coating is a wash of copper and tin solution.

Temper a Heavy Factor

Temper or hardness of the wire for heading and threading is of equal importance. The temper depends on the number of drafts, or reductions in diameter in drawing the wire, and it is often right here that the fundamental cause of troubles experienced in cold heading may be found.

It is common practice, when ordering wire for heading, to specify not only the analysis of the steel and the finish but also the temper or degree of hardness. Failure to take the various factors mentioned into account when ordering will result often in difficulties that could be prevented.

Heat Treatment of Blanks

Cold-headed blanks are usually annealed to remove the heading strains. Work having heads of unusual size or shape is annealed before the heads are completed and then finished in a reheader. However, the quantity of reheading work is comparatively small, it being possible in most cases to upset practically any head in a two or three-blow header.

A heat treatment is recommended, especially for carriage bolts and work having special heads, and consists of thoroughly heating and quenching the blanks in oil. The exact procedure depends on the composition of the steel and is defined by the manufacturer. Heat treating increases the tensile strength of the bolts and refines the structure of the metal. Quenching in water after heating is another means of toughening the blanks.

Machine bolts of ordinary proportions are not always heat treated after heading, because the heading strains are not so severe as those in carriage bolt heads, which are shallow and brought down to a thin edge.

Low-carbon steel analyses suitable for small screws, such as used in electrical work and ordinary fixtures, for

*Waterbury, Conn.

agricultural machinery bolts (not heat treated) and for machine and carriage bolts, follow:

Carbon	0.08 to 0.12 per cent
Manganese	0.35 to 0.45 per cent
Sulphur	0.03 to 0.04 per cent
Phosphorus	0.03 to 0.04 per cent
Silicon	0.10 per cent

For hex-head cap screws used in the automotive industry the steel known as Type G wire is used extensively. A steel of higher carbon content, known as Type E wire, is used also for automobile screws. Their chemical analyses are:

	Type G	Type E
Carbon	0.08 to 0.15 per cent	0.27 to 0.37 per cent
Manganese	0.30 to 0.45 per cent	0.70 to 0.90 per cent
Sulphur	0.05 per cent (maximum)	0.05 per cent (maximum)
Phosphorus	0.03 per cent (maximum)	0.05 per cent (maximum)
Silicon	0.07 to 0.15 per cent	0.07 to 0.15 per cent

Other steels suitable for cold-heading are those in the S.A.E. standard specifications, No. 1010 to 1035 inclusive.

In the alloy steel field are numerous analyses suitable for cold-heading and threading. It is difficult, however, to head a nickel steel containing over 3 per cent nickel and over 0.20 per cent carbon. All alloy steels should be heat treated after cold-heading. Following are two steels that can be recommended for average heading operations:

Carbon	0.30 to 0.40 per cent	0.10 to 0.14 per cent
Manganese	0.50 to 0.70 per cent	0.28 to 0.38 per cent
Phosphorus	0.04 per cent (maximum)	0.04 per cent (maximum)
Sulphur	0.04 per cent (maximum)	0.04 per cent (maximum)
Silicon	0.10 to 0.25 per cent	0.10 to 0.15 per cent
Nickel	1.00 to 1.50 per cent	.....
Chromium	0.50 per cent	0.25 to 0.30 per cent
Vanadium	.....	0.13 to 0.26 per cent

Preparing Steels for Forgings

Overcoming the Effect of Overheating—Service Not Affected by Dendritic Structure—Protective Glaze for Furnace Walls

THREE papers of special interest to forgers were presented at one of the sessions during the National Metal Congress in Cleveland, Sept. 9 to 13. Two of them discussed the protection of furnace walls and the overheating of steels, while the third considered the matter of fiber and dendritic structure.

Albany Slip—A Refractory Glaze for Furnaces

William J. Merten, metallurgical engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, finds that the so-called Albany slip (a refractory glaze used in the high-voltage porcelain industry) is an excellent protector of furnace fire brick. The finely ground powder suspended in water is sprayed thoroughly over the cold brick and left to dry. Then the heat is put on and raised gradually to 2000 deg. Fahr., when a glaze forms into a continuous protective sheet. This converts the chamber into a heat-reflecting and radiating body of high efficiency, reducing heat losses and the time required to raise the steel to temperature. Cooling causes the glaze to develop small craters but these heal on subsequent heating. Reglazing is necessary at intervals.

Fred G. Frisbie, Duquesne Steel Foundries, Pittsburgh, said he had used the glaze at a temperature of 1700 deg. Fahr., on annealing furnaces for steel castings, and found it to be a good heat reflector and to promote equality of temperature between furnace walls and contents even though the glaze had not been fritted by a preliminary high heat. However, he could not agree with Mr. Merten that the same glaze would protect steel from oxidation in a sharp furnace atmosphere, even if the metal had been dusted with soapstone previous to dipping into the Albany slip.

Effect of Overheating Steel for Forging

Two papers on the burning and overheating of steel had already been published by W. E. Jominy, University of Michigan, Ann Arbor, Mich., resulting from investigations financed by the American Gas Association. A final summary was presented under the title "Overheating of Steel for Forging." Temperatures at which steels show evidence of incipient fusion, that is, the burning temperatures, were determined by microscopic studies. The question then arose whether the coarse crystallization, caused by reheatings *below* the burning heat, would cause damage to forgings, or induced any effect which could not be removed by subsequent heat treatment. Mr. Jominy therefore raised the common carbon and nickel forging steels to various temperatures in a range just below burning, heat treated them (quench, draw, and normalize) and then tested them in tension, performed the McQuaid-Ehn test for carburizing, and examined the microstructure. In general he found no reduction in ductility or other properties when the steels were heated no higher than the following temperatures, which he fixed as the maximum safe temperature for heating prior to forging:

	Deg. Fahr.
S. A. E. steel No. 1015	2650
S. A. E. steel No. 1030	2600
S. A. E. steel No. 1050	2525
S. A. E. steel No. 1090	2375
S. A. E. steel No. 3145	2450

O. W. Ellis, Mellon Institute, Pittsburgh, pointed out that Mr. Jominy's determinations of the burning temperatures gave figures considerably higher that the solidus line in the iron-carbon equilibrium diagram as at present accepted, and indicated that some revision would be necessary. The new figures do check those of Carpenter and Keeling who published the earliest precise diagram showing the melting points of steels.

Problem of Dendritic Steel Discussed

An interesting treatment of the question of "Dendritic Steel" was given by H. G. Keshian, metallurgist, Chase Companies, Waterbury, Conn., since he gave evidence regarding the physical properties of steels of comparable analysis, some of which were dendritic and others which did not have this structure—at least to an evident degree. In the forged and heat-treated condition, no material difference can be detected in the tensile properties so the author concludes that the microstructure and not the macrostructure is the dominant factor. In fatigue, as denoted by the Stanton repeated impact test, a dendritic one per cent carbon steel had a slightly lower value. Directional properties (specifically, reduction in area) were less favorable in a dendritic chromium-nickel steel but in wearing properties, when made into drawing dies, no difference could be detected.

A free discussion followed this paper by Mr. Keshian, but it all had to do with the cause and production of dendritic steels, and did not contest his main conclusion that satisfactory service in a sound steel is not related to its possession of visible dendritic structure or lack of it.

Production Control in Steel Foundry

Sivyer Shop Uses Checks, Frequent Inspections and Daily "Pow-wow" to Meet Specifications and Scheduled Delivery Dates

BY ROGERS A. FISKE*

ACCURATE checks on materials and plant methods, rigid inspections at frequent intervals and establishment of channels of informed intelligence are the main factors which have enabled the Sivyer Steel Casting Co., Milwaukee, to keep close control of orders and materials in process, and to forward an unusually high percentage of orders on dates scheduled.

This is a jobbing foundry and imposed upon it are the common limitations in the standardization of materials and operations. Special attention, therefore, has been given to the control of variables from the standpoint of fundamentals of steel casting production and quality. Control of the variables which affect quality begin at an early stage of the process, even before a charge of scrap is loaded into the furnace. Incoming scrap and other materials are inspected before being unloaded from the car.

A 1000-lb. test heat, which is carefully observed by the melter, is made from each car of scrap before the car is unloaded. An analysis is made of a test piece taken from the furnace as soon as the metal has melted down. This analysis is taken not only to decide acceptance or rejection of the carload, but as a means of placing the scrap in its

*Western editor, THE IRON AGE, Chicago.

EVERY Afternoon Shop Executives (Right) Study Patterns Which Are to Go Into the Shop. Records of past difficulties are analyzed, also

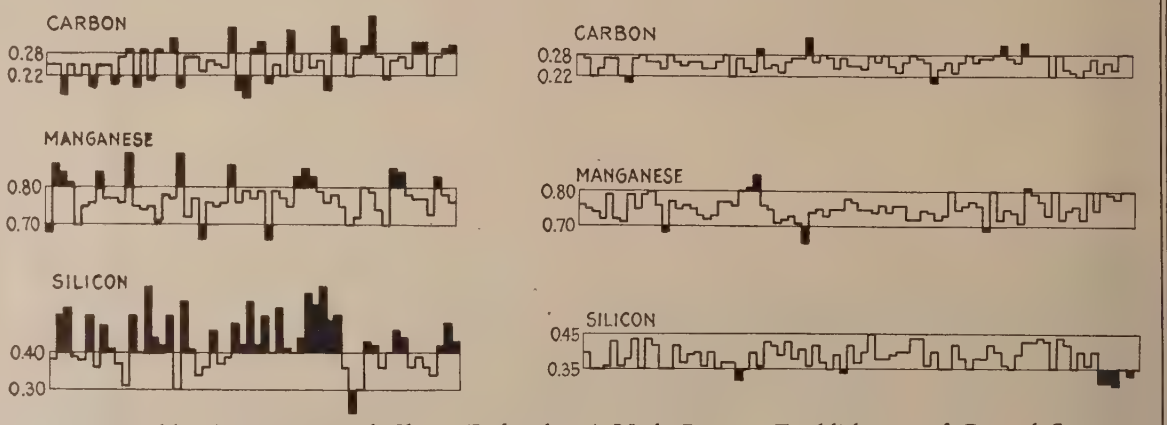
* * * *

WORK Order Cards Are Filed on the Schedule Board (Above) in Accordance with Dates Which Have Been Established by the Foremen

proper bin, since incoming scrap is segregated according to carbon or sulphur and phosphorus content.

Each heat of steel is analyzed for the required elements, immediately after tapping from the furnace, and its analysis is reported to the melter before the next heat is tapped. This practice promotes better analysis control, by giving the melter the analysis of one heat before he taps the next. It also enables the operating department to hold out castings the analysis of which does not conform to required specifications. This latter practice is of material aid to the production department, for new molds may be made up, without much time lost, to replace castings which do not meet analysis requirements.

Melters are paid a bonus to stimulate interest in analysis control. This bonus is based upon a score which is obtained by dividing the total number of points outside the desired analysis range by the total number of heats. As



Typical Monthly Furnace Control Chart (Left, above) Made Prior to Establishment of Control System. Black areas show heats outside of the desired range. At right is a chart similar to the other, showing benefits derived from close furnace control

the score diminishes, the per cent of bonus, based on monthly salary, is increased in ascending rates. If a heat is scrapped for wrong analysis, a definite percentage of the bonus is subtracted as a penalty.

The melter records the analysis of each heat, as well as the amount of alloys used, on an analysis log. He is required also to make a report of materials used for each heat, which is sent to the accounting department. And he makes a report of furnace operations and delays, for the melting foreman. Physical tests are made at regular intervals and their data, as well as the chemical analysis, are permanently recorded in the laboratory, the former on a card index file, the latter on a daily analysis report, which is later bound and filed.

Of special interest is the method of sand control. Incoming sand is tested for fineness. The sand mill is provided with an indicating and recording time-meter, which regulates the milling time. A control sand laboratory is placed near the sand mill. Here one man devotes his entire time to testing facing and backing sand mixtures, the object being to eliminate variables as much as possible.

Control of Work in Process

In a jobbing steel foundry the establishment and maintenance of production and shipping schedules require close and persevering attention. It is difficult to control fully by work tickets the movement of individual castings or orders. Automatic progression cannot readily be obtained by continuous conveyors, due to the varying condition of the product in process, and diverse circumstances governing sequence of operations. However, control is obtained by issuance of forms and records at strategic points, which are supplemented by organized personal attention of the production department or supervisory force.

New orders are entered on Form *A* in duplicate, one section being a recapitulation of the information given in the order, and the other section is used for entering information relative to cores needed. At this point, the receipt of the order, careful check is made of previous orders, if any, for the same patterns. Quotations are checked, questions of analyses are settled, and delivery promises previously given are entered for shop information.

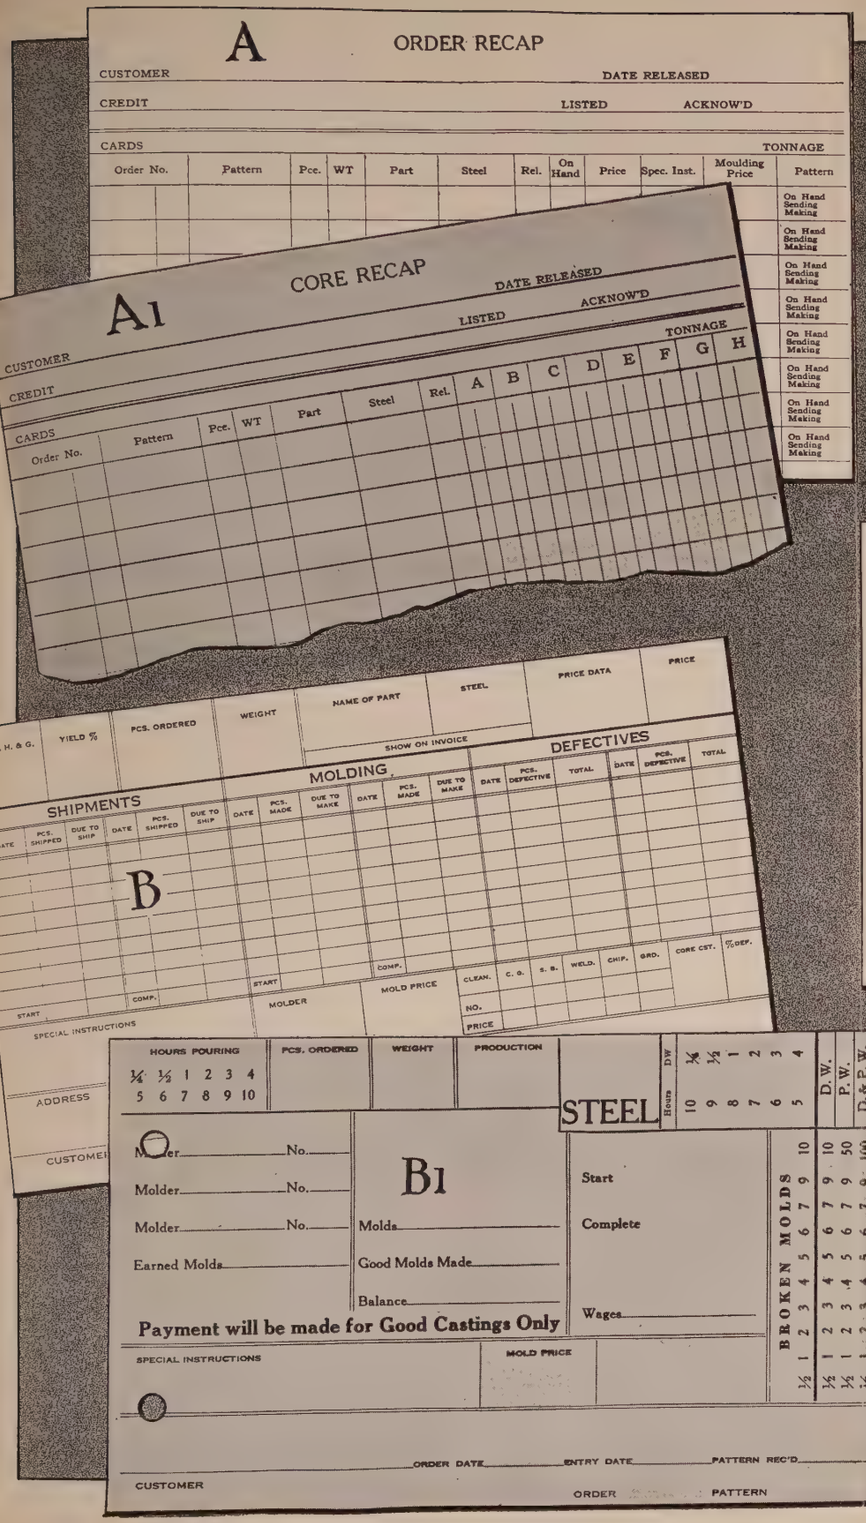
From the order recapitulation one work order, Form *B*, consisting of four cards, is issued for each pattern. One copy is sent to the shipping department, one to the pricing department and two to the pattern storage. The form sent to the shipping department provides space for dates, pieces made, pieces shipped, defectives and delivery dates scheduled. The shop cards provide space for specific instructions needed to put the job in process and to show a record of work performed. Printed on these cards in boldface type is the warning "Payment will be made for good castings only."

A core order, Form *C*, is made from the core recap of Form *A*. Form *C* is sent to the core department with core boxes at least two days before the molders get their work orders. This allowance of time is considered ample to permit the core-making department to have its part of the work completed well in advance of the beginning of molding operations.

Old Patterns Studied Before Again Being Sent into Shop

Shop orders, upon leaving the office, are sent direct to the pattern storage and all pattern equipment required is laid out on a bench for inspection. Every afternoon a meeting of the shop executives is held for the purpose of carefully studying and examining pattern equipment which is to be used. Accompanying each old pattern are records of any difficulties reported, either by the customer or the foundry, on previous orders. Unusual loss by defectives is also given consideration at this time.

Both old and new patterns are individually checked from the standpoint of design, method of casting manufacture, state of repair, anticipated defects and matters affecting scheduling of the order. In most cases foundry equipment consisting of heads, gates, etc., is inspected with the pattern or is ordered from the pattern shop at this meeting. This insures consistent manufacture of the casting in the approved method on successive orders. Matters requiring communication with the customer are



FORMS Used in Controlling Operations in the Foundry. *A* and A_1, made out together, show what the piece is to be and what cores are needed. *B* and B_1, four cards in all, give specific instructions for putting a job in production. *C*, the core order, goes to the shop two days before the molders get their work orders. *D* records orders for new patterns and is made in duplicate. *F* shows, when necessary, the high-scrap report or shortage; three copies go to superintendent, chief inspector and pattern record. A special instruction card *G* is issued if it is necessary to call attention to a difficulty

THE IRON AGE, October 17, 1929

brought to the attention of the production or the sales department. Corrective steps are taken if necessary, and these are noted on the shop orders and permanent records. This meeting is attended by the superintendent or his assistant, the chief inspector, the pattern foreman, the core room foreman and members of the production department.

Each morning all approved orders received at the pattern storage on the day before are given to the schedule clerk. The foreman of each molding department is called in and the jobs as a whole are discussed and molders are assigned. Dates on which shop work will begin on the various jobs are set according to work ahead. The work-order cards are then filed on the schedule board in accordance with the dates which have been designated. At this time the records of previous difficulties are examined and acknowledged by the molding foreman. The foreman is then held responsible for fulfillment of molding schedules according to orders assigned to individual units, and he makes necessary arrangements for delivery of complete equipment to the molders. A day-by-day record of his schedule efficiency is kept, and is one of the items considered at the daily production meetings.

After a job is definitely scheduled, one copy of Form *B* is sent to the office. From the date recorded thereon a shipping date is determined and the customer is notified when shipment will be made. This copy of the order is the production department's delivery control record. Both molding and shipping dates are recorded thereon and it is used daily in checking progress of orders so as to insure movement in process and shipment as promised.

Shipping Schedules Discussed at Production Meetings

At 2 p.m. each day a production meeting is held, at which molding and shipping of scheduled orders are discussed and current and overdue promises, both of molding and finishing departments, are given particular consideration. The primary purpose of this meeting is to pry into causes of delays and rectify them before they have been in effect long enough to check production seriously and result in dissatisfaction at a delivery promise not kept. It is the aim of the management squarely to place responsibility for all schedules and production work, but it does not want single-handed direction. Cooperation among all persons interested is expected, and accordingly the chance for error or omission is greatly lessened.

An interesting feature in connection with the pattern shop is that it has been placed on its own merits. A customer who is in need of a pattern may ask for a bid from the Sivyer shop which often is competitive with outside pattern makers. Blueprints are carefully studied by the superintendent and assistant superintendent and suggestions are made for design improvement if difficulty is foreseen. The most advantageous method of pattern construction from the casting quality viewpoint is determined and is used by the pattern shop in making its estimate. Patterns, when ordered, are recorded on Form *D*.

Back of the desire to eliminate difficulties and to rectify them quickly when encountered is the thought that every such case is an opportunity to build prestige with a customer, and it can be made an incentive to keep the pattern at the Sivyer foundry. Defects are often discovered in the shop. These frequently can readily be rectified without inconvenience to the buyer. However, it is the omission that leaves the plant that nettles the purchaser, and which may be the direct and primary cause of loss of future business. Accordingly special attention is given difficulties which purchasers have experienced with Sivyer products. An expression of trouble may come by letter or by word, or it may be passed along to a salesman. Whatever the source, immediate attention is given it.

The detailed report is entered on Form *E* (not illustrated), which is headed "Disposition of Difficulty Reported by Customer." This report shows how the difficulty has been overcome, a reply by the inspector, and finally the question "Have we written customer?" In the upper right-hand corner is a ruled space for the signatures of the superintendent, his assistant, the quality supervisor, chief inspector, and members of the production and sales department. If necessary to call attention to the difficulty reported, when future orders are produced, a "Special Instructions" card is issued.

Records Disclose Past Difficulties

This sheet (Form *E*) is attached to the pattern storage record, and goes with the pattern each time it is called out of storage. In this way the foremen familiarize themselves with past difficulties whenever a pattern is called into the shop.

Sample castings are made on any pattern specified by the customer, from new patterns produced in the Sivyer pattern shop, or when desired by the shop executives. These castings are given personal supervision by the assistant superintendent and the quality supervisor. A follow-up method is used, necessitating approval from both the manufacturing and the quality standpoints, to insure recording of instructions available for future reference before the original request is filed.

Careful watch is kept on the space on Form *B* which is provided for defective material. If an excessive percentage of castings on an order is found defective a high-scrap Form *F* is made out in triplicate by the production department. One copy goes to the superintendent, another to the chief inspector, and the third, which is printed on cardboard, is attached to the pattern record. This comes to light again when the pattern is next called into the shop. The information on Form *F* is studied at the pattern meeting.

Checks on general defective control are a daily procedure. In a conspicuous place in the main shop are three red lights which are labeled respectively floor molders, jolt machines and squeezers. At the end of each work day the total scrap is computed for each of these three departments. The one with the highest percentage of scrap is known to all the workmen because the red light designating that department burns during the next day.

Inspection forms an important link in maintaining quality and in catching errors before they reach the stage where they cannot be readily rectified and shipping schedules cannot be maintained. Each inspector has a specific station at which he examines each casting as it passes. It is also his duty, when not pressed with work at his station, to make general inspections. By this arrangement the workmen do not know at what stage of their work a close check will be made. The principal stations for inspectors are on the molding floors, prior to sand blasting, after grinding and chipping, after welding, and the final inspection prior to shipment.

Those in charge of responsible work are given full assistance, but, once a course is determined, then responsibility is placed squarely where it belongs. All reports made in the shop are written on carefully prepared forms, which always provide ample space for the signatures of the men through whose hands they pass. These reports are kept alive, that is, they are readily available for future use in placing responsibility, and it is known throughout the shop that they will quickly be used for that purpose.

At first this system may seem extremely strict in placing the blame for errors and omissions. However, it builds among the men a sense of responsibility and pride. Good work is quickly recognized and bonuses are the reword. It holds the organization to a sense of obligation to the purchaser, and the results are exceptionally satisfactory when it is considered that this jobbing steel foundry sends its products to 30 major groups of industries in 28 States.

Business Is on a Firm Footing

Industry and Trade Are Free From Inflation and Should Not Be Severely Shaken If Bull Stock Market Comes to An End

BY DR. CHARLES O. HARDY

BUSINESS continues to display a higher rate of activity than most observers anticipated a month or two ago, and such slackening as is evident has occurred chiefly in those industries whose pace during the summer was obviously too high to be maintained continuously.

Electric power consumption, railroad freight car loadings, coal production, employment and the turnover of bank deposits are all reported at high levels. Corporation reports of earnings for the first half of 1929 reflect an even more favorable condition than was expected on the basis of the high level of productive activity which has been reported throughout the year.

The decline in the rate of operations of the steel industry which began early in the summer continued up to the end of September, but reports of operation so far in October indicate a turn for the better. Unfilled orders of the United States Steel Corporation for Oct. 1 show an increase for the first time since April. The improvement is apparently due chiefly to a good volume of railroad buying, which offset a slackening of orders from the automobile industry.

Some relaxation of activity in the automobile industry is not surprising considering that the output for the first nine months of 1929 surpassed that of any previous complete year. The slack in the low-priced car market, which arose from the long interruption of Ford production, is apparently now substantially taken up, so that further sales may be expected to be more representative of replacement demand and the normal growth of the business.

Bad crop conditions in the West and in the South give rise to apprehension of restricted farm buying, but reports of both wholesale and retail trade are very favorable.

¶ Fundamentals of prosperity undisturbed by technical condition of securities market.

¶ Question is not whether speculation overestimated the prosperity of business, but whether business men have overestimated their markets.

¶ If bull market in stocks is over, major business depression need not be feared.

¶ In previous bull markets business itself was shot through with speculation and price inflation.

¶ Higher European bank rates do not necessarily mean tighter money here.

¶ Federal Reserve's attempt to restrict speculation is likely to be abandoned if business, rather than the stock market, is choked.

¶ A major stock market decline would interfere temporarily with financing programs.

¶ Shift from stocks to bonds might take three to six months, but would facilitate financing of small companies, residence construction, foreign loans and Government enterprises.

Gold Loss Forced Rise in English Rate

Money market conditions and the stock exchange have continued to hold the center of the stage throughout the month, the "big news" being, first, the increase of the discount rate of the Bank of England, followed by advances by the Scandinavian central banks, and, second, several spectacular breaks in prices on the New York Stock Exchange. Does either of these developments suggest the probability of a change for the worse in the level of business activity?

The increase in the Bank of England rate, from 5½ to 6½ per cent, undoubtedly points to the probability of continued high money rates. Ever since the Federal Reserve System abandoned its cheap money policy and began selling securities at the end of 1927, New York has been a magnet for European, and especially for British, gold. European funds in increasing volume have been placed in the New York call loan market and acceptance markets, while at the same time the amount of foreign bonds placed here has shrunk to a small fraction of the amounts placed a year or two ago. With more European money loaned here on short-term accounts and less borrowed on long-term accounts, pressure has been exerted on the European exchanges, the gold outflow from this country has stopped and since then over 200 million dollars of gold has come in.

This inflow has enabled our banks to replenish their reserves, offsetting the effects of the sale of securities by the reserve banks and to that extent reducing the need for rediscounts. If the higher rates in Great Britain should result in a renewed eastward movement of gold, the pressure on our money markets will be intensified.

This does not necessarily mean, however, that business will be so pinched by money shortage as to make impossible the continuance of the present era of prosperity. Several alternatives suggest themselves. First, the pull of the New York call loan market may be sufficient to overcome the influence of the new higher rates. If so, it seems unlikely that the British public opinion (which since the war has been extremely sensitive on the subject of money rates and their supposed cramping effect on business) would tolerate further advances in the rate. Rather it seems likely that indirect means would be found to replenish the gold reserve and restrictions would be placed on foreign lending of British funds in order to make possible the financing of domestic business at rates no higher than those now in effect.

As a second possibility, the stock market liquidation which has been under way for the past few weeks may proceed so far as to release funds now tied up in brokers' and speculators' balances, with the result of easing the market for all types of loans. This has obviously been the objective of Federal Reserve policy for months. While the policy has so far been unsuccessful, it may yet succeed,

or may seem to succeed, because the speculative fever has run its course.

Third, considerable relief may still be found through a change in the composition of the credit structure. A shift of a large volume of deposits from demand to the time form would lessen the required reserve and furnish slack to offset the tightening effect of the withdrawal of European funds. This process went on at a great rate for several years prior to 1929, though it has ceased for the past 12 months. More probably, and in greater degree, the market pressure may be relieved by the shift of funds from the bank loan accounts to direct loans by individuals and non-banking institutions (of which the conspicuous case is "brokers loans on account of others").

Federal Reserve Policy May Change

Fourth, and most likely, the Federal Reserve authorities may elect to put additional credit into the market to offset the effect of such gold withdrawals as may result from the recent advances in European bank rates. There can be little doubt that such action would be taken as soon as it became evident that the movement of goods in commerce and the rate of industrial production were being restricted on account of the tightness of the money market. The objective of the Federal Reserve policy in recent months has been to force a contraction of speculative credit, not because of immediate need but as a safeguard against an anticipated deficiency of commercial and industrial credit.

Because both business and speculation have shown such unexpected indifference to the level of money rates the restriction of Reserve credit has gone much further than any one anticipated when the policy was initiated. If it should presently appear that business, rather than the stock market, is being choked off by this restrictive policy, we may confidently expect it to be abandoned. Indeed, the softening of money rates over the past two weeks in the face of higher rates abroad seems to indicate that Reserve Bank purchases of acceptances have already gone beyond the amount necessary to accomplish the nominal purpose of providing credit for the autumn seasonal excess of demand for currency and for export credits.

It does not appear, therefore, that increase in the English bank rate is an alarming adverse development in our own business situation. British rates have long been obviously too low in the light of world-wide demand for credit for speculative purposes, and this attempt to bring them into line with world markets needs occasion neither surprise nor alarm.

The second adverse development of the past month is found in the behavior of the stock market, where prices have broken very sharply on several occasions, the break in each case being followed by a strong upward reaction. Many market observers are of the opinion that we have finally reached the top of the bull market which began in 1924, and there has been widespread uneasiness lest the anticipated decline in stock prices may operate to undermine confidence and lead to a curtailment of the scale of business operations.

We are not disposed to offer a prediction as to the immediate future of the stock market. Appearances certainly indicate that quotations are out of line with present and prospective earnings and are being sustained by buyers who hope to resell presently at still higher prices. Competent observers have been deceived so often, however, by the vitality of this bull market that confidence in all forecasts is at a low ebb.

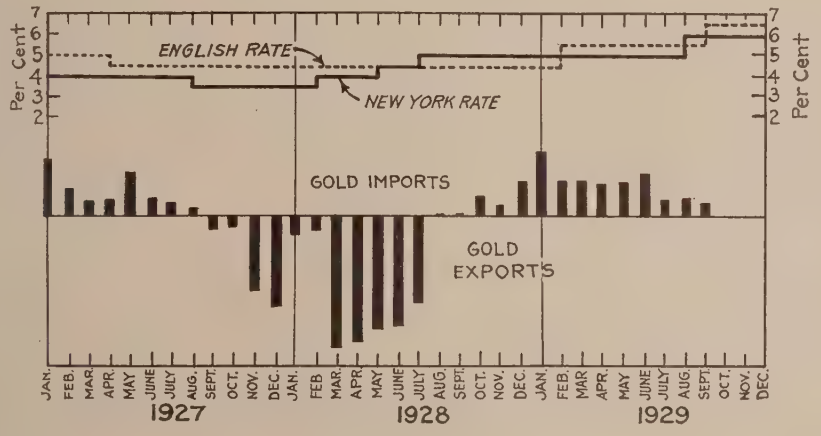
Inflation Localized in Stock Exchange

What, however, is the probable effect on business if the stock market has actually reversed its trend? In the past a major downward turn in stock prices has often been the immediate forerunner of a wave of business liquidation. This was true in 1890, in 1903, in 1907, and in 1919-20. Such experience, however, is of doubtful application to our present situation. These peaks of stock speculation which were forerunners of business collapse occurred at times when the whole business world was itself shot through with speculation and price inflation; indeed, those stock market booms were only indexes of a general excess of optimism which expressed itself in overborrowing, overexpansion of plants, and overaccumulation of inventories. Today apparently inflation is pretty well localized in the stock exchange. If this is true, we cannot safely use stock price trends as mechanical forecasters of business changes.

May there not be a more direct causal relationship? Would not the mere psychological effect of a stock market collapse produce a wave of pessimism and lead to the wholesale curtailment of business commitments? And further, would not the withdrawal of public support from the stock market curtail the financing of industry and thus force a contraction in industrial construction, with consequent repression of many other lines of activity?

As to the first of these questions, opinion is only opinion. Mass psychology defies prediction. Sometimes a turn in public sentiment has been effected by a shock much less far-reaching than a stock market collapse of major proportions would be now; and sometimes it has defied far greater shocks.

As to the second question something more definite can



CHANGES in Discount Rates of New York Federal Reserve Bank and Bank of England (Above)

Net American Imports and Exports of Gold (Below)

be ventured. Certainly a real stock market decline would interfere temporarily with current financial programs. The shift of preference of the investing public from bonds and other types of loans to stocks has led to a corresponding shift in American methods of financing business. The change has worked to the advantage of large and well-known firms which have already a market, or can create markets, for their stock. It has worked to the disadvantage of small concerns, of residence construction enterprises, of foreign borrowers, and of Government and municipal enterprises. A collapse of confidence in the stock market would presently lead to a revival of bond buying and of the types of enterprises which cannot take advantage of the stock market boom.

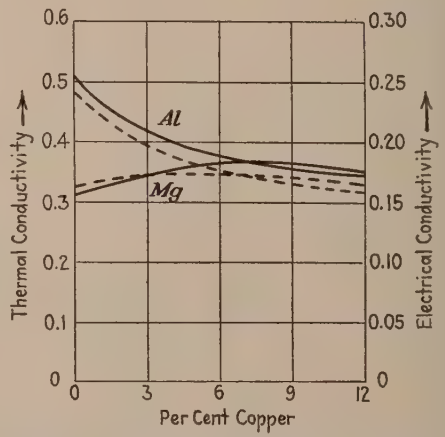
This effect would not be immediate. Typically in the past in a major liquidation of stocks, bonds, though already low, have gone down with stocks (largely on account of forced selling to protect stock holdings), and there has been an interval of from three to six months before the bond market turned upward. It would be surprising if a similar result should not fellow on the next prolonged stock market decline. Investors can wait, and in times of liquidation are likely to wait till the drift of things is clear. It seems probable, therefore, that some curtailment of new financing, and of new construction, will be necessary in connection with the next bear market in stocks—whether it occur this fall or many months hence.

Basically, however, the foundations of prosperity and depression are not to be found in the technical condition of the stock market or the bond market. The question is not whether investors and speculators have overestimated the prosperity of business; it is whether business managers, by and large, have overestimated their immediate and prospective markets. If we are right in our judgment that hand-to-mouth buying rather than speculative accumulation is still the order of the day in the commercial world, and that industry has not in general overestimated its needs and loaded itself with structures and equipment far beyond its needs, we must conclude that no serious business depression is in prospect.

Thermal Conductivity of Light Alloys for Pistons

A note by C. Grard and J. Villey, presented to a recent meeting of the French Academie des Sciences, shows that the thermal conductivity of aluminum-copper alloys decreases with increasing copper, whereas the effect in the magnesium-copper series is the opposite. Since copper is a usual hardener, it is important to know that there is little difference in the thermal and electrical properties of the two systems when the copper is 7½ per cent or more.

Several of these alloys are of particular value for aircraft engine parts, especially the aluminum alloy with 13 per cent of silicon known as Alpax, as well as two magnesium alloys with 4 per cent of copper and 2 per cent aluminum, and 2 per cent copper and 4 per cent aluminum. An aluminum alloy with 12 per cent copper is the mixture used largely in France for the casting of pistons for airplanes, experience having shown that this alloy is satisfactory under the conditions and heat (300 to 320 deg. C.) to which it is subjected in service.



Influence of Copper on Conductivity of Aluminum and Magnesium. Full line represents thermal conductivity at 100 deg. C.; dotted line represents electrical conductivity at 100 deg. C.

Steel Box Cars on Rubber Tires

THE St. Louis Southwestern Railway has placed in service several highway freight trains made up of steel vans approaching box car dimensions. The vans, which are mounted on pneumatic tires, have inside measurements of 16 ft. in length and 7 ft. in width and height. Rear doors have piano-type hinges and a side opening has sliding doors. When loaded the vans may be sealed to insure the safety of the goods in transit. The trains are drawn by large truck tractors and are equipped with Westinghouse brakes.

The highway freight train was developed following years of study by railroad engineers to find a way of avoiding frequent stops of heavy trains to pick up or deliver small shipments. The highway vans were built by the Columbian Steel Tank Co., Kansas City, Mo., and are mounted on Lapeer trailers.

Anneals Magnetic Sheets Electrically

Reducing Atmosphere Eliminates Necessity for Boxes and Produces Bright Sheets, Without "Stickers", Having Improved Magnetic Characteristics

BY F. E. FINLAYSON*

ANNEALING is one of the most important processes in the manufacture of laminated steel used in the magnetic circuit of an alternating current electrical machine. Proper annealing goes hand in hand with the proper chemical analysis in producing a grade of steel which will give the lowest electrical losses.

Silicon steels are most commonly used for magnetic purposes because of their relatively low cost, and their ability to reduce hysteresis losses in the machine, when properly heat treated. For some applications, steels are used having a silicon content in the neighborhood of 4 per cent. Other steels having the silicon content around 2.5 per cent and 1.25 per cent are used. One grade known as standard steel has a silicon content of less than 0.25 per cent.

Magnetic steel is rolled into thin sheets for laminations, which are most frequently about 0.014 in. thick. Laminations are used, however, ranging in thickness up to about 0.025 in. After rolling the sheets are cut to proper shape by stamping.

Magnetic steel is annealed either before or after punching. In preparing for the anneal the sheets (or laminations) are simply stacked in orderly large piles without regard to leaving any space between individual sheets. The resulting stack is unusually difficult to heat treat, having essentially the mass of a solid block, perhaps several feet thick, and the poor heat conductively of a series of separate sheets. Notwithstanding the difficulty however, the heating must be thorough and uniform all the way through the stack. In other words, the temperature at the end of the heat must be the same in the center of the stack as at the outer edges if the proper results are to be obtained. These difficulties are common to those of box annealing in any sheet mill.

For annealing, silicon steels are heated to a temperature of 725 deg. C., (1337 deg. Fahr.) held at that temperature for about two hours, and then cooled relatively slowly to about 150 to 200 deg. C. The so-called standard steel is heated to 750 deg. C. and held for about four hours before cooling. Grain structure before and after the process, is as shown in the photomicrographs.

*Industrial department, General Electric Co., Schenectady, N. Y.

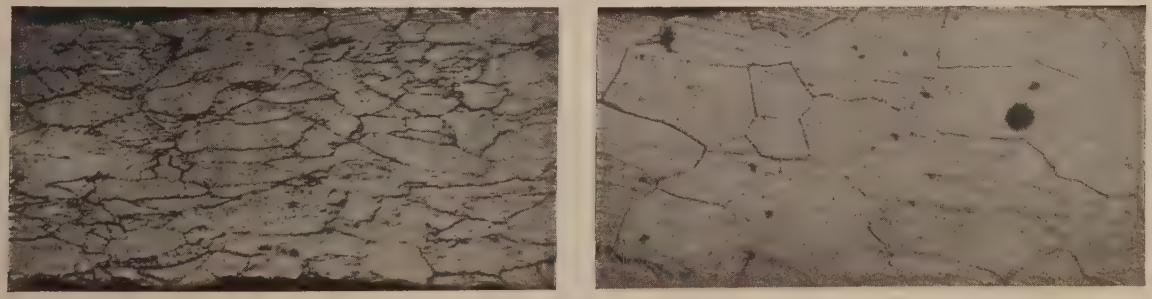
Old Method of Annealing

Before the installation of the electric furnaces now used, all of the magnetic steels were annealed in oil-fired furnaces. Sheets were carefully packed into steel boxes to protect them from oxidation by the furnace atmosphere. Many of these boxes were commonly stacked about the furnace. A sand sealed lid covered the box and excluded air from the sheets during the anneal. Four of these boxes usually constituted a load for one furnace.

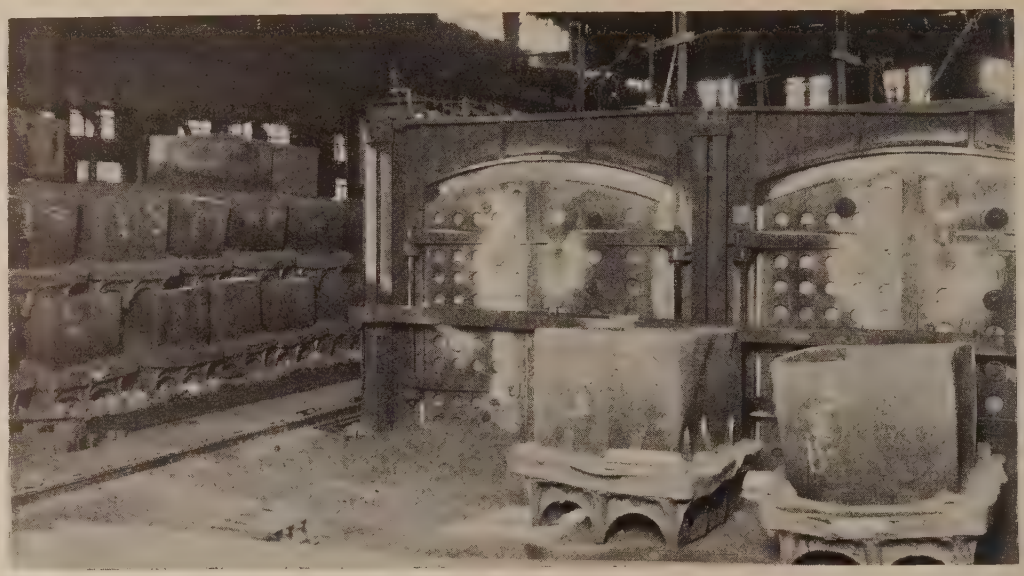
The disadvantages of this method of annealing were many and serious, the worst being the unsatisfactory results obtained, and the excessive cost. It was found to be practically impossible to get proper uniformity of temperature throughout the material in the boxes, and as a result much of the steel was found defective. Samples were taken from each box after the anneal, and where they showed up unsatisfactorily the entire box was reannealed. This retreatment averaged about one box load out of every eight.

Furthermore the sheets annealed in the oil furnace had a tendency to stick together. Large stacks of sheets had to be broken apart before any further work could be done on them. This not only required considerable time, but ruined many sheets, as the workmen would often bend or tear them beyond recovery.

Also the fuel consumed in these furnaces was excessive, not only because of the inherent inefficiency of furnaces of this type, but also because of the weight of the boxes required for containing the sheets. Each box weighed 2½ tons empty, whereas its useful load of sheet steel weighed only 3½ tons. Over 40 per cent of the energy reaching the boxes was therefore wasted in heat-



Grain Structure of a Silicon Steel Sheet, Before and After Annealing. Magnification 100 diameters

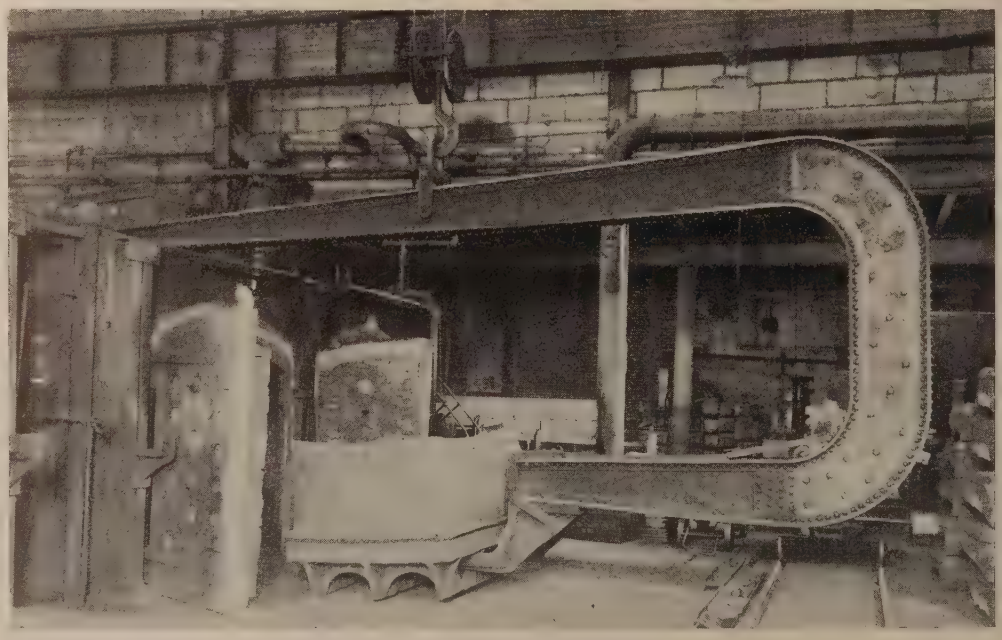


Oil Fired Furnaces Formerly in Use in General Electric Plant. Note extra space and investment required for annealing boxes and stools

ing the boxes themselves. Then, too, the cost of the periodical replacement of boxes became a very important item; actual figures on this will be given later.

It is obvious that the area covered by the oil furnaces was really the smaller part of the total floor space required for the annealing process. A large number of boxes were continually kept on hand, stacked about the furnace in every available place, to provide empty containers for the new work and to allow the heated work to cool outside of the furnace.

Heat losses from the furnace together with the heat from the cooling boxes united to make the room where



Charging Peel, Operated from Shop Crane, Used to Place Pot Load of Transformer Iron in Old-Style Annealing Furnaces

the annealing was done insufferably hot, particularly during the summer months.

Annealing with the Electric Furnace

These oil fired furnaces for annealing laminations have now been entirely replaced by elevator type furnaces such as the one shown in one of the cuts. These furnaces are electrically heated, and are filled with non-oxidizing gas which is a mixture of 15 per cent hydrogen to 85 per cent nitrogen. This artificial atmosphere not only prevents oxidation but actually *reduces* oxides which are already present when the steel enters the furnace. Therefore the steel sheets come out of this furnace clean and with absolutely no tendency to stick together. A slight flow of gas at slightly greater than atmospheric pressure is kept moving through the furnace at all times to insure that no oxygen will find its way in. There is little danger, however, of producing an explosive mixture in the furnace because of the diluted condition of the hydrogen.

The general construction and internal features of such a furnace are shown by the drawing. The furnace proper is raised several feet above the floor; in fact, sufficient clearance is allowed for a fully loaded car to roll under on the tracks provided for that purpose. The entire car carrying, with its load, is hoisted into the opening at the bottom of the furnace by a hydraulic or motor operated lift. A gas-tight seal is provided around the bottom of the furnace opening by inserting the edge of a steel plate into a trough of sand.

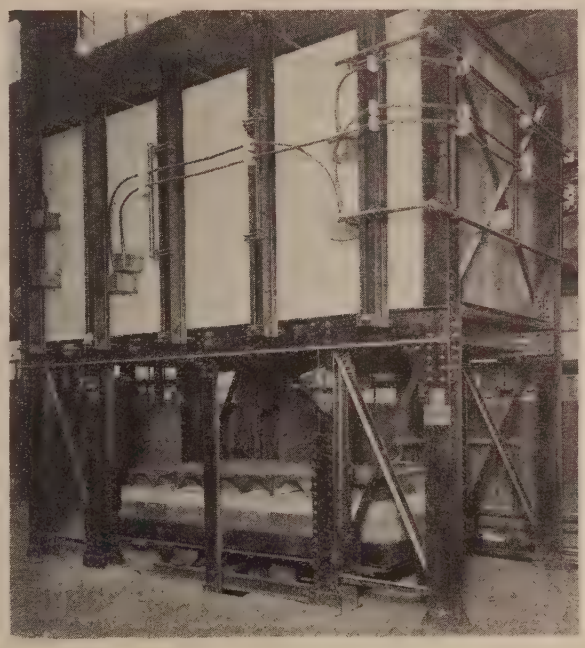
Heating units are arranged around the sides of the furnace chamber, low resistance terminals coming through sealed bushings in the walls. The furnace chamber is lined with fire brick, and the space between that chamber and the outside steel shell is filled with insulation.

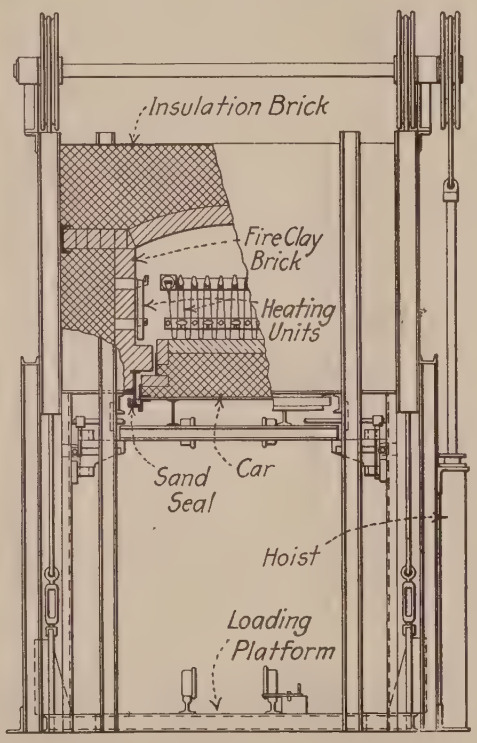
The furnace shown holds approximately 15 tons of steel, stacked 30 in. high upon a car having a series of metal hearth plates which measure 57 in. wide by 127 in. long.

Heat requirements, measured by the connected load of this furnace, is 240 kw. at 550 volts, 3 phase. An average load is brought to heat 12 to 18 hr., the actual time required depending on the final temperature, the weight and kind of material being heated, and how the work has been loaded. The load is then "soaked" in the furnace for 2 to 4 hr. to insure absolute temperature uniformity throughout the stack. Since very slow cooling is not essential to give correct magnetic properties, the loaded car is then removed from the furnace and placed under a non-insulated steel cooling hood, where it cools to between 150 and 200 deg. C. in approximately 24 hr. This cooling hood is kept filled with the same mixed gas used in the furnace to prevent oxidation, and by the time the steel is removed from this protecting atmosphere it has reached a temperature where but very little oxidation takes place.

Several cars are provided for each furnace so that one can be cooling under the hood, another heating in the furnace, and still others being loaded and unloaded. Obviously this results in a great saving of time and floor space. The use of the cooling hood also results in a saving in power, since it obviates the necessity of cooling the work in the furnace. This not only saves the power necessary to reheat the furnace, but makes it possible to insulate the furnace thoroughly and still get a short cooling time.

Efficiency of the insulation is shown by the following experiment: One-third of a load of standard steel was heated to 765 deg. C., power turned off, and the furnace allowed to cool with the charge inside. Forty-six hours





SIDE View and End Section of Electric Furnace for Annealing Stator and Rotor Punchings. The empty car body is shown under furnace; in the drawing the car body is elevated to form the bottom of the heating chamber

later the temperature had dropped to 630 deg. C., a cooling of only 135 deg. in nearly two days.

Naturally the most important things sought for in a new annealing process are improvement in the product itself, and reduction in cost. Electric annealing provided these, and more.

When the change was made from oil-fired to electric furnaces a number of tests were run to show the influence on the quality of the steel itself. Standard tests were used to determine the hysteresis loss in watts per pound of steel at a magnetic flux density of 10,000 lines, both before and after annealing in both kinds of furnaces. The accompanying table gives a summary of the results on "standard" steel.

Hysteresis Losses in Sheets (Watts per Pound)

Thickness, In.	Magnetic Losses Before Annealing	Where Annealed	Magnetic Losses After Annealing
0.025	2.410	Oil furnace	2.082
0.025	2.388	Oil furnace	2.062
0.014	2.515	Electric furnace in hydrogen	1.332
0.025	2.940	Electric furnace in hydrogen	1.990
0.014	2.595	Electric furnace in mixed gas	1.350
0.014	3.468	Electric furnace in mixed gas	1.455

Improvement in the higher silicon steels was not quite so marked, but 5 to 10 per cent is being regularly obtained.

In 1924 a careful record was kept on an electric elevator furnace and a car type oil-fired furnace to determine relative costs as a basis upon which to reach a decision regarding new facilities about to be installed. Both furnaces were practically new and of the same capacity; 3½ tons of sheets to the load. The electric furnace used a steel plate upon which the sheets were loaded and the oil furnace used one long box container.

The plates cost $18 each and were good for 30 anneals; the pots cost $400 each and were good for 50 anneals. With 3½ tons per load this makes the cost of plates 0.86 cents per 100 lb., and the cost of boxes 11.4 cents per 100 lb. The cost per 100 pounds annealed was found to be:

	Electric Furnace	Oil Furnace
Fuel.....	(10.8 kwhr.) 13.50c.	(2.89 gal.) 16.5c.
Plates or boxes	0.86c.	11.4c.
	14.36c.	27.9c.

Items of labor, overhead, maintenance, interest and depreciation required to give the true cost cannot be given, but the above figures give the essential facts. Three of these 3½-ton furnaces, having a total cost in the neighborhood of $25,000, resulted in an annual saving of approximately $23,000 over the same capacity in oil fired furnaces.

The advantages do not end there. Relative ease of handling the materials into the elevator furnace, the comfortable, quiet working conditions, the small floor space required for loading, heating, cooling and unloading all contribute to the saving in cost and the improvement in morale among the workmen.

Elevator type electric furnaces for annealing magnetic steel have proved entirely satisfactory in every respect. In fact, the unusual success of the installations for that purpose has resulted in one manufacturer of electrical equipment installing 25 furnaces of this kind, and the adoption of this type of electric furnace for other purposes, such as the annealing of castings, disk wheels and gear blanks. The design of the furnace adapts it particularly well to long time heating and lighter-than-air atmospheres such as hydrogen, because the opening, being at the bottom, materially reduces "door losses" and prevents the escape of gas.

If it is necessary to anneal without scale it will be found that it is not necessary to substitute an atmosphere such as hydrogen. The reason is that the steel being heated contains considerable quantities of gases, which are liberated during the annealing process, so that the resulting electric furnace atmosphere is in fact, reducing.

Summing up, the advantages over the old method by the use of elevator furnaces for annealing magnetic steel and other materials are as follows:

Marked improvement in annealing results.

Reduction in annealing cost per ton, because there are no pots to be heated, and the cost of pots, as well as the labor cost for handling them has been saved.

Possibility of heavier loading, and reduction in annealing time which results in greater output for a given area of floor space.

No oxidation or sticking of sheets because of the nature of the atmosphere in the furnace.

Improvement of working conditions around the furnace resulting from the elimination of noise and gases in the atmosphere, and the reduction of heat losses from the furnace.

ONE of the attractive exhibits at the National Metal Exposition in the Public Auditorium, Cleveland, Sept. 9 to 13, was that of the Gray Iron Institute, Inc. The products of a number of members of the institute were displayed, as shown by the illustration, and the booth was visited by many of those in attendance. It was a testimonial of the rapid expansion of the Gray Iron Institute and concrete evidence of the work which it is doing.

Fire Protection and Prevention

Methods of Precaution to Limit or Avoid Losses, Interruption to Business and Diverting of Markets

BY A. H. RODRICK*

DESTRUCTION of a factory building from fire not only means unemployment for the workers, but often involves a loss to the employer of his most valuable employees, who obtain other employment during the period of reconstruction and never return. The owner obviously suffers a further loss due to the cessation of business, unless he carries Use and Occupancy insurance.

Losses due to stoppage of production, disorganization of business and delay in filling orders, as well as the loss of customers who, like the workers, seek other business connections and are never regained, cannot be covered by insurance. When fires are frequent the insurance cost of protection is greater.

It is a subject to which every industrial manager should give serious thought, and he should study it from three angles: fire prevention, fire fighting and fire regulation.

SO frequently is fire the result of gross carelessness that it behooves us, every so often, to take stock to determine wherein that carelessness lies and observe once again how it can best be avoided. There is much suggestion in this article which would go a long way toward preventing industrial fires and limiting their destructiveness, if the cautions sounded are properly heeded.

Fire Prevention

Statistics are not available showing the percentage of fires resulting directly from carelessness, but like accidents fires do not happen; they are caused. A sure method of preventing fires is to remove the condition which is likely to result in a proximate cause.

Carelessness in the use of matches, in the handling of dangerous articles, and in the disposal or storage of combustible materials, is the primary cause of most fires. A careless act or unsafe practice or habit is the thing to be most guarded against.

If workmen handled flame with the same lack of concern as does a child a match, disastrous results would quickly follow. Some men use acetylene or gas torches in just as dangerous a manner as though they possessed the mind of a child. In many cases their apparent carelessness is due largely to lack of thoughtfulness, resulting from constant use.

A lighted cigarette is a most dangerous article in the hand of a careless man, as many men after smoking flip the burning stub, with no thought as to where it will land, or how long it may burn. During 1926 careless smoking was reported as the cause of fires involving $37,800,000.

When acetylene or gas torches are necessary the greatest care should be exercised in their use. Red-hot rivets and highly heated particles should not be allowed to be dropped on canvas or oil-soaked material. When such work is being performed caution should be used, that the dangerous articles do not come in contact with material inflammable or likely to ignite.

Workmen should be instructed that a match or cigarette should never be discarded until the flame or fire is thoroughly extinguished. The danger likely to result from a thoughtless act should be stressed, and they should be made to understand clearly that safety for themselves and others, as well as for property, is far more important than speed. Repetitive and rhythmical motion, while necessary to increased production, should not be permitted to become a habit and thereby subordinate safe practices.

To Avoid Spontaneous Combustion

Disposal or storage of combustible materials manifestly requires more consideration than is ordinarily given to material of a less hazardous nature. Cotton waste moistened with linseed oil should not be allowed to stand in contact with the air. Rags and cotton used by painters, as well as overalls and jumpers, should not be exposed to heat, but should always be stored in a metal receptacle. Sawdust in pans to catch oil drippings should be replaced with sand. Rubbish heaps are fire hazards and cleanliness is a requisite in fire prevention.

Spontaneous combustion is an ever-present cause for fires, and the theory of this condition should be clearly understood. Coal stored in large quantities is susceptible to combustion and its storing and piling should be conducted with this fact in mind. Soft coal should not be stored on damp spots, for dampness helps spontaneous combustion. Coal in piling should be tamped down to eliminate air spaces, and the height of the pile should not exceed 12 ft.

Storage of gasoline should be underground. Whenever trucks are being filled or emptied the danger of discharge of electric sparks should be guarded against by grounding.

Proper Design of Buildings Helps

In constructing buildings the subject of fire prevention should occupy a prominent part in drawing up plans to guard against unprotected vertical and wall openings. The idea that a building is fire-proof is a misnomer. This was evidenced in the case of the 15-story office building of the Chicago, Burlington & Quincy Railroad in Chicago, which burned on March 15, 1922.

Every attempt should be exerted to make buildings fire-resistive rather than fire-proof. The question of

* Industrial engineer, Washington.

arrangement of buildings to prevent fire from spreading should be considered also. The hazards in sawmills, lumber yards, etc., can be materially reduced by arrangement. As the greatest damage by fire is often due to spreading of the conflagration, thought should be given to both the exteriors and interiors of structures, to keep a possible fire localized.

Automatic fire alarms for detecting fires are advisable, and automatic sprinkler systems are most effective as to protection against spread of fire. Their installation whenever practical is economical, as the savings in insurance premiums pays for their cost within a few years.

Fire Fighting

When a fire does break out the situation must be faced in a calm manner, and the fire fought vigorously as well as intelligently. As in the case of accidents, many people lose their heads when they confront a fire emergency, and an excited and frenzied person is a liability rather than an asset.

Of course, the city fire department should be summoned immediately, but fires often reach an uncontrollable stage before arrival of the fire apparatus. Many such could have been restrained had they been tackled in their inception. The employer should see that his employees understand how to administer "first aid" at a blaze, just as first aid is administered to an injured or apparently drowned person, pending the arrival of a doctor.

Fire is the evolution of heat and light by combustion. It should be remembered that flame is not at all essential to the existence of a fire; it is only a part. There may be a fire without flame; bituminous coal, for example, gives more flame than anthracite coal.

The fire may smolder, and manifest itself only by smoke or smell, until the whole mass is reduced practically to ashes. Or oxidation may proceed so rapidly that the whole mass bursts into flame; in that event we have a plain case of what is ordinarily called "spontaneous combustion." To extinguish a fire of this character in a coal pile, the coal must be removed from around the burning part and spread out on the ground. The burning part can then be removed or put out by water.

Correct Use of Appliances

In fighting a fire, the fire itself should be attacked, rather than the flame. Extinguishers should be applied, not to the flame, but to the place from which the flame comes. Employees should be instructed how properly to use fire-extinguishers, fire hose and all other first-aid fire-fighting appliances. Fires involving oil or gasoline should be blanketed, for water spreads the burning liquid.

In buildings where automatic sprinkler systems have not been installed, water barrels, buckets, hydrants, hose and chemical extinguishers are simple and effective first-aid fire apparatus. The barrels and buckets should be kept filled at all times and the buckets plainly marked "For Fire Use Only."

Fire hose is almost indispensable, and should be a part of the plant equipment in all buildings having hydrants. It should always be hung at each hydrant ready for any emergency.

Fire Regulations

After a fire does occur its cause should be determined by an impartial investigation, and the necessary steps taken to prevent a recurrence from the same or similar cause.

The greatest fire protection is a set of effective fire regulations. Such regulations, when drawn up, should be rigidly enforced without fear or favoritism. It is better to lose one skilled employee who disregards such protective measures than to risk the danger of loss of human life and property. Disciplinary action serves as a deterrent to others, and is often the only means of compelling strict obedience.

It is impossible to enumerate all the hazardous acts which should be prohibited, for they differ according to the structure and situation of the industry. What would be negligible in a fire-resistive building could not be disregarded in a sawmill. A few major suggestions only can be offered, as a guide in framing such general regulations as are applicable to any kind of industry. By analogy the same suggestions would apply also to any business or other establishment not classed as industrial.

Avoid the Use of Matches

Because of the danger of fire from matches, the safety type only should be allowed in the plant. Whenever possible a flash-light should be used in place of matches. Workmen frequently seek a lost part in some dark spot by the light of a match; such practice should be forbidden.

If smoking is allowed, it should be confined to less dangerous places, and never permitted anywhere within one hour before closing time. This affords an opportunity to discover any smoldering fire which may be in existence prior to the time the buildings are vacated, since such a fire from this cause is likely to manifest itself within one hour.

All persons smoking should be required to deposit the cigarette, cigar or pipe remains in a metal cuspidor or receptacle filled with water. Sand as a filler for these receptacles should not be used. It is a fire preventive but, with cigarettes particularly, the stub continues to burn and the air soon becomes foul from the escaping smoke. If water is used, both the fire and the smoke are at once extinguished.

Unsafe practices of any character should be corrected as soon as they occur. Employees should be instructed at the time the dangerous practice is first noted, when it is fresh in the mind of the offender. It is then he is most likely to respond to correction. Advice and warning given in this manner are apt to be recalled in the future. Foremen and supervisors should at all times be observant of fire hazards and take the necessary steps to remove or rectify them.

If fire hose is installed it should be given a water test at regular intervals, and its condition carefully examined for leaks and breaks. A defective hose may be useless at a time when it is really needed. A red band should be painted around each post to which a fire-extinguisher is attached, and all emergency exits indicated by a red light.

Organizing to Fight Incipient Blazes

Fire squads should be organized throughout the entire plant, one on each floor, under the supervision of squad captains. One employee should be appointed fire marshal, whose duties would be similar to those of a safety engineer. He should conduct plant inspections in so far as fire hazards and fire equipment are concerned, and make pertinent recommendations regarding fire prevention and fire regulations. He should have charge of all fire squads. The fire marshal and squad captains should not be changed unless necessary, but the personnel of each squad should be changed monthly.

Each squad member should be assigned a specific duty to perform in case of fire, such as fire-extinguisher, fire hose, telephone city fire department, etc., and be trained to assume his post upon the sounding of an alarm. To make this effective a fire-drill should be held at least once during the period each squad is assigned to this duty, and in large buildings the remaining employees should be taught to leave in an orderly and expeditious manner. In such an organization each employee understands how to assist in fighting a fire, when called upon.

A fire-alarm system with station boxes should be in-

Full-Automatic Bevel Gear Rougher

Hydraulically-Operated Manufacturing Machine Cuts Four Blanks Simultaneously

FOR large quantity rough cutting straight bevel gears of the sizes ordinarily used in the differentials of automobiles, the Gleason Works, Rochester, N. Y., has designed the four-spindle rougher illustrated. The machine is entirely automatic, the only duty of the operator being to keep the four magazines supplied with bevel gear blanks. One attendant can handle several machines, which feature minimizes labor costs.

With the exception of the cutter drive, the entire machine is hydraulically operated. Four blanks can be cut simultaneously; these are mounted on four independent work-heads arranged around the cutting tool, which is a 20.8-in. diameter disk milling cutter having 32 inserted blades.

Each work-head is adjustable to set the work to the proper root angle and cone distance. In operation, each work-head is fed into the cutter to cut a tooth slot in the blank, and is then moved away to permit indexing. After all the teeth are cut, the work head backs away from the cutter approximately 5 in. to the loading position; the cut gear is pushed off the arbor automatically and a new blank is taken from the magazine by an automatic loading mechanism, placed on the arbor and clamped in position. The head then returns to the operating position and the cutting and indexing cycle is repeated. An automatic safety control prevents starting of the feed movement in case the blank is not properly placed on the arbor.

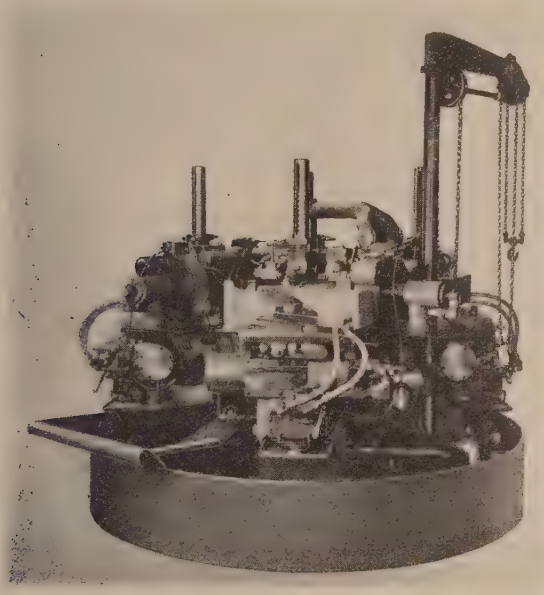
The index mechanism is of the notched-plate type. Movement of the piston which controls the indexing operation is constant for all numbers of teeth within the range of the machine, so that it is only necessary to change index plates to cut different numbers of teeth. Travel of each work-head is controlled by adjustment of a stop dog, and the speed of movement is governed by a cam which controls the opening of the main work-slide control valve.

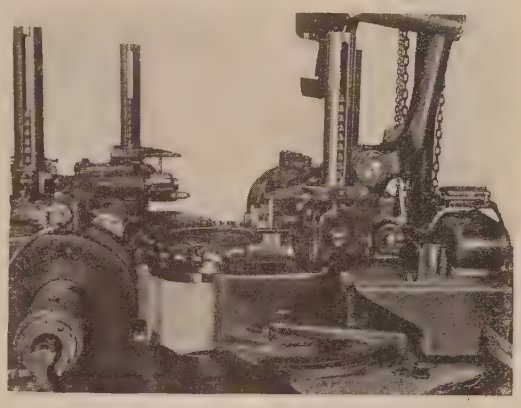
The time of movement of the work-head to loading position is governed by an adjustable control device, which can be set for gears of any number of teeth from six to 30. As the work-head slide moves away from the cutter after cutting each tooth, this control device is indexed one notch; when the last tooth is finished the control device trips to swing the work-head slide trip-dog out of the way, permitting the main piston to run back to its extreme position for loading. The control device resets itself automatically.

The loading operation is controlled from a series of valves cut into a single drum, so that it is impossible for the various operations to get out of time with each other.

Work-heads are entirely independent of each other, and any one of the four heads can be in operation at one time. In many cases, several different gears or pinions may be roughed satisfactorily at one time with the same cutter. The cutter is placed and removed by means of a crane and chain hoist, arranged as shown. Four supply pipes convey coolant to the cutter at the cutting positions, and the arrangement is such that when the cutter guard is swung up to permit access to the cutter, the coolant supply is automatically shut off. The cutting oil is supplied by a 45 gal. per min. centrifugal pump from a 145-gal. reservoir. Lubrication of the cutter and drive spindles and of all bearings is effected by two pumps, cam-operated from the main drive piston. Chip deflectors attached to the saddle housing direct the chips to the skirt surrounding the cutter. The control column that carries this skirt is provided with a circular floor of steep pitch so that the cut gears, oil, and chips slide down the chute into a pan, where they are separated.

Loading of the magazine is facilitated by use of a loading bar on which the blanks are assembled. About 20 gear blanks are carried in each magazine.





FOUR Bevel Gears Can Be Roughed Simultaneously. The machine is fully automatic, the only duty of the operator being to keep the magazines supplied with blanks, which permits one attendant to handle several machines. Based on cutter speed of 115 ft. per min., the cutting time per tooth ranges from 4.5 to 30 sec.

The machine is arranged for built-in motor drive, a 10-hp. motor being employed. It occupies floor space of 85 x 103 in., and weighs approximately 12,000 lb., net. Specifications are, in part, as follows:

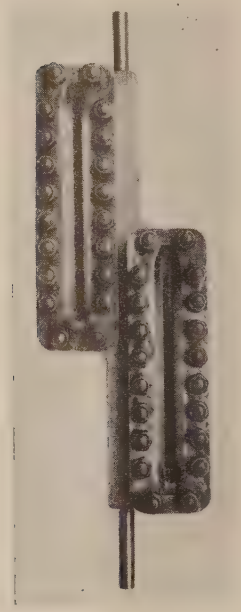
Capacity: Largest pitch, 3 D. P.; maximum and minimum feed movement of workslide, 1 in. and ¾ in., respectively; largest pitch diameter that can be cut, 4 in.; greatest and smallest pitch angle, 65 deg. and 25 deg., respectively; and greatest adjustment of work-head, parallel to feed slide, 3½ in. The speed of the cutter head ranges from 21.2 to 95.5 r.p.m., or from 115 to 520 ft. per min. Based on a cutter speed of 115 ft. per min., the cutting time per tooth ranges from 4.5 to 30 sec.

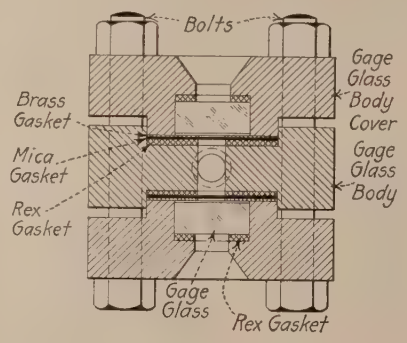
Workmen's safety committees obtain the best results when their real purpose is the placing of responsibility for developing a preventive attitude among workmen, states the Safety Service of the Policyholders Service Bureau of the Metropolitan Life Insurance Co., New York, in its bulletin, "Workmen's Safety Committees," which is the fifth in a series on industrial safety. The booklet outlines the methods of organizing and conducting safety committees.

Water-Gage for High Pressures

Unusual Construction Needed to Withstand Physical and Chemical Forces—Packing Was a Problem

WITH the high pressures of some of the latest steam power plants, experience shows that satisfactory service cannot be obtained from tubular water-gage glasses. With boilers operating at pressures over 350 lb. to the square inch the life of such glasses was found to vary from a few hours to about 6 weeks. The Babcock & Wilcox Co., New York, discovered that pure feed water at pressures above 350 lb. have a chemical action on the glass. Furthermore, even were the strength unimpaired, it is quite difficult to avoid breaking the glasses, when packing them for a pressure of 600 lb. and upward.





EXTRAORDINARY Precautions Are Needed in Water-Gages for Heavy Steam Pressures. As shown, there are two glasses, one each side, and several gaskets are used

Flat, plain or fluted gage glasses were found to be better for such high pressures. Even here, however, deterioration from the action of the water and difficulty in packing them render them unsatisfactory. Double flat glass protected on the water side by mica was tried and found successful up to about 600 lb. pressure. Above that, however, it was impracticable to pack it steam-tight without breaking it.

To meet the high-temperature and high-pressure conditions a new type of gage-glass, as illustrated, was developed by the Babcock & Wilcox Co. This is said to have given satisfactory service under pressures up to 2000 lb., above which it has not been tested. The body comprises a central holder and two covers, each slotted vertically.

In the recess in each face of the holder is first placed a gasket, then a sheet of mica and on that a thin brass gasket. In the recess of each cover is first placed a gasket and then a bar of glass about 0.7 in. thick.

When the parts are bolted together, which, as the half-tone shows, is done very thoroughly, only the boiler pressure can come on the glass, which is protected from chemical action by the sheet of mica. The thin brass gasket seals the edge of the joint between the cover and the glass. In service the glass has been found to last indefinitely, but the gaskets and mica need renewal every month or six weeks.

Two fittings at different elevations are used on the same water column, when considerable difference in water levels must be indicated.

Hydraulic Control Device in Place of Solenoids

A HYDRAULIC operator intended to take the place of large alternating or direct-current magnets and solenoids has been brought out by the General Electric Co., Schenectady. The device is also offered for use in place of air cylinders where quiet and smooth upward thrust is desired through a given distance.

It consists of a motor-driven centrifugal oil pump, the impeller of which is mounted in a piston and driven by means of a spline shaft. This arrangement permits the stationary mounting of the motor. The normal position is with the piston at the bottom of the cylinder which is approximately two-thirds full of oil. When energized the motor drives the impeller, creating a pressure between bottom of the piston and bottom of the cylinder.

The piston is cast so that the oil is fed to the center of the impeller from both the top and bottom. The oil is forced from the end of the impeller blades through ports to the space below the piston. The pressure tends to move the piston upwards and it will travel the full length of the cylinder provided the load on the ends of the push rods is not too great.

The operators are rated on the stalled thrust basis; that is, the number of pounds they will balance when the motor is running at full speed. The three standard sizes give 200, 300 and 600 lb. push. The speed of operating is somewhat slower than that of a solenoid. The ¼ to ½-hp. motors used come up to speed in approximately 0.1 sec. The time required to raise the piston will depend upon the diameter and speed of the impeller, the diameter and length of the cylinder and the load to be lifted.

In the largest size without load the piston will travel 6 in. in 0.45 sec. With 300 lb., or half load, it will start in 0.35 sec. and complete the travel in 0.85 sec. With maximum or stalled thrust load, 600 lb., it will not move at all or very slowly. Due to the stored energy in the revolving parts the downward movement does not start until 0.3 sec. after the motor is de-energized, and that is with maximum load. Since the oil must be forced back through the revolving impeller blades as dashpot action results, it requires 0.8 sec. for the total downward travel.

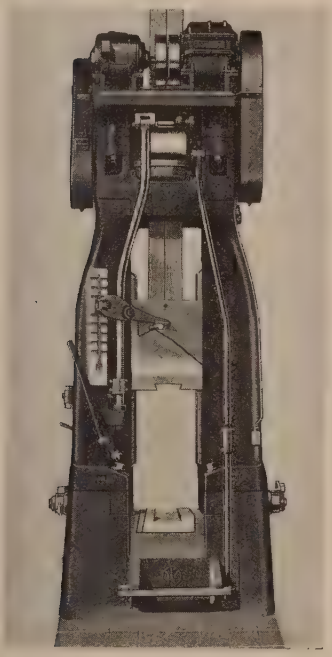
The device can be applied to brakes, clutches, door and window openers, spot welders, and pumps.

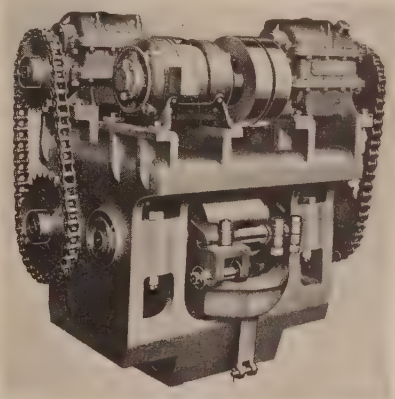
Hydraulic Operator for Use in Connection with Brakes, Clutches, Spot Welders, Pumps and Other Places in Which Solenoids and Air Cylinders Are Used

Drop Hammers with Motor-Driven Rolls

Roller-Bearing Equipped, Compact and Balanced Drive Claimed to Reduce Wear and Increase Output

DROP hammers featuring individual motor drive for both front and rear friction rolls have been brought out by the Billings & Spencer Co., Hartford, Conn. The machine is designated as the model G, and is built in nine standard sizes, ranging from 1000 to 3000 lb.





FRONT and Rear Friction Rolls Are Equipped with Individual Motor Drives. Each motor is connected by flexible flywheel coupling to a speed-reduction unit, from which the drive to the roll is by chain and sprocket. High production is claimed for the machine

Compactness and balance are features of this drive, which, in eliminating whip and pull of long horizontal belts, is said to prolong board life and markedly reduce wear on guides and other parts. The motor for each roll is connected by a flexible flywheel coupling to the helical gear speed reducer, from which the power is transmitted by chain and sprockets. Both motors are tested to run at synchronous speed, and are controlled from one push-button station. Hyatt solid inner and outer race, sealed roller bearings are used throughout the driving mechanism.

The head casting rests directly on the uprights, and the latter are held securely to the lower section of the head by heavy horizontal tie bolts. Springs located in pockets in the uprights take the shock from the tie bolts. The head carries counterbalanced cast-steel eccentrics, which are made unusually long so that the roll spindles may be mounted in long roller bearings. The roller bearings are separated by spacers, ample allowance being made for lubricant, which is applied by grease gun through Alemite fittings. Eccentric arms clamp on a large alining pin. The rolls are shrunk on to the spindles, and both rolls and spindles are ground so that the bearing will be smooth and the rolls will not rough the boards.

Board clamps are carried in a floating frame below the rolls, the same as in the company's model F hammer. Roll and clamp adjustments are made from the floor, at the rear of the hammer. Guides are of double-vee type, and are arranged so that the lower section may be removed conveniently and reversed or replaced without removing the ram or other parts.

To permit greater adjustment for various thicknesses of dies, the knock-off has been modified. A bolt and latch that slide in parallel holes in the left-hand upright has been provided, the latch being adjustable so that a late knock-off for thin dies is secured by sliding it to the right and an early knock-off for thick dies by sliding it to the left, or, in other words, varying the amount the latch projects under the friction bar dog. All adjustments are in plain view and may be made conveniently. The latch extends under a dog on the friction bar and is held up when the ram is falling. A safety latch is also provided. The friction bar is practically straight and when released falls vertically.

The bearing between the uprights and base is of larger area than in previous models and the upright has oil holes so that a film of oil may be maintained over the bearing area. No part of the treadle mechanism extends to the rear of the hammer, thus leaving the rear free for forgings. The hammer treadles with ease, due to the toggle joint mechanism of the board clamp. Production from the model G drop hammer is said to exceed that of any previous model built by the company.

Sheet Metal Finishing Machine

GENERAL operations on sheet metal, such as burring, turning, wiring, crimping, beading, slitting, flanging and elbow-edging, can be performed on a new electric combination machine, No. 172, made by the Niagara Machine & Tool Works, Buffalo. It will handle sheets up to No. 18 gage and is run by a ¼-hp. motor, built in and taking current from a lighting socket.

Features of the machine include a frame design that houses the motor and incloses all gears and clutch parts. The clutch of special design gives quick control by hand lever or foot-treadle. It can be locked for continuous operation. A switch on the machine provides for over-load protection. Ball bearings are fitted to the drive shaft and intermediate shafts while the roll shafts are bronze-bushed.

Flexibility in Operation Is Had by Use of a Variety of Forming Tools

Motion of the upper shaft is controlled by combination crank screw and foot-treadle. Either of these operates independently, without removing or adjusting the other. Lateral adjustment of the upper shaft is made from two knurled screws.

The Bantam Ball Bearing Co., South Bend, Ind., is building a roller thrust bearing 39 in. in diameter for use in a special boring mill.

Mileage Rate Case Stirs Controversies

Buffalo Producers Oppose Reopening, While Philadelphia Interests Claim Proposed Tariffs Are Too Low

WASHINGTON, Oct. 15.—Sharp controversy has developed over the request made of the Interstate Commerce Commission by the Eastern railroads for a reopening of the general Eastern iron and steel rate case. The case, decided under the Hoch-Smith resolution, prescribes a completely new rate based on mileage scales, throughout Official Classification territory. The railroads, as pointed out in THE IRON AGE of Oct. 10, page 983, raised five primary objections to the decision, among them the scales established, which were declared to be too low; the port differential relationships provided; routes to be followed and the New York harbor arbitrary of 2c. per 100 lb., etc.

Most of reply briefs vigorously oppose reopening of the case and make pointed attacks on the position of the railroads. Port authorities of New York have complained of the arrangement of differentials. Northern towns in New Jersey have objected to the relationship given as associated with New York. Philadelphia commercial organizations have gone on record before the commission in support of the views of the Eastern railroads that the level of rates prescribed is too low and have joined with the carriers in asking for reconsideration of the case. They also urge that the fourth section (long-and-short-haul) requirements are detrimental to Philadelphia interests.

On the other hand, strong protests against the reopening of the case have come from various affected sections, and the Baltimore Association of Commerce has opposed an attack on the differentials set up. One of the sharpest briefs in opposition to reopening of the case was filed by Edgar E. Clark, Wilbur LaRoe, Jr., and Frederick E. Brown, Washington attorneys, in behalf of Buffalo producers, including the Buffalo Bolt Co., the Donner Steel Co., the Seneca Iron & Steel Co., and the Wickwire-Spencer Steel Corporation. The reply petition filed for the Buffalo interests bluntly stated that the request of the railroads was entirely without merit.

The carriers' claim of a loss of $2,500,000 in revenue from the proposed scales was declared to be misleading because of the failure of the railroads to indicate "the enormous gains in carrier revenue during the last few months." It was pointed out that reports of the carriers showed that in the first seven months of the present year the net railroad income of the petitioning carriers was $63,173,000 greater than the net in the corresponding period of 1928.

"This makes the alleged revenue loss appear inconsequential," the reply brief stated. "The alleged revenue loss is but a drop in the bucket compared with the hundreds of millions in gain in carrier earnings, both gross and net, since this investigation was instituted."

The point made by the railroads that the rates are too low was declared to be nothing new.

"It has at all times been understood by the parties and by the commission that if the rates were established on a basis lower than full fifth class the carriers would consider the rates subnormal and depressed," the brief stated.

"It is immaterial that there will be some loss in revenue from the rates prescribed. Many of the iron and steel rates were unconscionably high. To a large extent the carriers had exacted the full fifth-class basis, which the commission finds too high. The carriers can not reasonably expect to obtain revenue increases from every investigation, although it is their strategy and their desire to produce that result."

At another point it was explained that the carriers lay considerable stress on the fact that under the commission's formula the distance between Youngstown and Detroit is 230 miles, while the shortest workable distance under the present classrate structure is 240 miles.

"This does not mean anything except that the carriers are charging 10 miles more than they should under the uniform plan approved by the commission in all other similar cases," it was declared. "How can this possibly be a ground for reopening the hearing?"

"The carriers say that 'they can find nothing in the record or in the commission's order or report which justifies or seeks to justify so substantial a revenue loss'. Railroads are proverbially unable to see a justification for any revenue reduction under any conditions. They are proverbially unwilling to admit that any rate is unreasonable. . . . Furthermore, the carriers have been guilty of indefensible discriminations because they have maintained widely different rates on iron and steel articles in different parts of Official Classification territory. . . . If the readjustment had resulted in assessing upon the shippers additional freight charges in the sum of $2,500,000 annually, the carriers would have been quite content."

The Baltimore Association of Commerce, through its attorney, Charles R. Seal, said that the Hoch-Smith resolution does not cover the differential adjustment about which New York has been fighting. It was contended that equal distribution of the burden of the transportation charges, provided for in the resolution, cannot be effected if the differentials are preserved as between New York and Baltimore. The petition for reopening of the case, Mr. Seal said, should be denied. He took occasion to add that none of the railroads serving Baltimore has joined in that part of the petition dealing with the differentials.

Railroads Extend Export Rates on Steel

WASHINGTON, Oct. 15.—Existing export rates on iron and steel products are assured until March 31. Eastern railroads last week filed tariffs with the Interstate Commerce Commission extending the current schedules which expire on Dec. 31. The fact that the railroads changed their policy by continuing the tariffs for a period of three months instead of six months, as was their practice for more than two years, has excited some comment.

The view prevails that the purpose of the new plan is to keep more immediate control over iron and steel export rates than heretofore because of the entirely new domestic steel rate structure in official classification territory, which the commission has proposed for application on Dec. 20. This is the so-called general Eastern steel rate case, decided under the Hoch-Smith resolution, a case that the railroads have asked the commission to reopen with both opposition and support from the different sections of the affected territory.

Ohio Foundrymen Thresh Out Problems

Association Holds Regional Meeting—Inadequacy of Profits Deplored—Improvement in Practices Outlined

PROBLEMS of the foundry industry, particularly those relating to making a fair profit on castings and the substitution of rolled steel for gray iron castings, were discussed by the Ohio Foundries Association, Inc., at the ninth annual meeting, held in Toledo, Oct. 10, Closer cooperation was urged to eliminate profitless competition.

Held at the Toledo Yacht Club, the meeting started with a luncheon, which was followed by talks, discussions and a business session that lasted through the afternoon. This was the first meeting to be held under the association's new plan for having four or five one-day meetings in different sections of the State, during the year, instead of one two-day annual meeting. That the plan will work out satisfactorily was indicated by a good attendance, the registration being close to 100. C. C. Smith, Toledo Steel Casting Co., president of the association, was in the chair.

Don McDaniel, Hamilton Foundry & Machine Co., Hamilton, was elected president for the ensuing year. George Alten, Alten's Foundry & Machine Works, Lancaster, was elected vice-president. Charles L. Seelbach, Forest City-Walworth Run Foundry Co., Cleveland, was reelected treasurer. Five new members of the Board of Administration were elected: George Alten; A. H. Kramer, Advance Foundry Co., Dayton; J. H. Bruce, Bowler Foundry Co., Cleveland; D. I. Miller, James B. Clow & Sons, Coshocton; and P. S. Horton, Wilmington Casting Co., Wilmington.

Profits of Foundries Too Low

The foundry industry as a whole does not make sufficient profit, declared M. L. Robinson, director of core oil sales, Werner G. Smith Co., Cleveland, in a talk on "What Has Become of the Foundrymen's Share of the American Dollar." Mr. Robinson listed nine reasons for the failure of foundries to make fair earnings. They were:

1. Lack of definite knowledge as to costs. As a remedy he urged the adoption of a uniform cost system.
2. Improper selling methods and unrestrained and unintelligent competition.
3. Failure to study customers' needs as well as failure to stress quality and service and not charging high enough prices for quality work.
4. Encroachments of other materials.
5. Taking tonnage lots at no profit.
6. Naming a flat price on all classes of castings.
7. Unwillingness of labor to give a fair day's work that will permit the employer to compete with other foundries having better labor conditions.
8. Lack of cooperation by the foundries, which places a foundryman at the mercy of buyers of castings and of competitors.
9. Lack of organization needed to enable the industry to articulate in the face of organized minorities.

Mr. Robinson emphasized the need of cooperation to improve conditions in the foundry industry, and spoke of the efforts being made by various other industries to cooperate through associations. In this connection he exhibited a number of newspaper clippings showing what some other industries are doing along cooperative lines to protect themselves and make a living profit.

Commenting on Mr. Robinson's talk, the chairman said that for a period of five years the earnings of 42 steel foundries were less than the money invested in their plants would have earned if put in banks at 3 per cent.

Improved Practices Outlined

Advances in foundry practice were discussed briefly by E. J. Lowry, consulting metallurgist, Detroit. The gray iron foundry industry is growing, but not to the extent of the other branches of the industry, he said. He held that the reason this is lagging behind is that the gray iron foundryman does not advertise his product.

Developments in the foundry industry have been fairly rapid the past four years, according to the speaker. Tensile strength of gray iron castings has been increased by melting at the proper temperature and by the addition of alloys. One foundry, he said, is producing castings with a tensile strength of over 60,000 lb. per sq. in.

Strength, hardness and ductility are needed in good castings. An analysis of these physical properties should be included in specifications. If alloys are used there should also be alloy specifications. The speaker pointed out that developments in the foundry industry have been in several directions. One has been the testing of sand. The sand problem is not very difficult. If the foundryman gets proper permeability and proper bond, good castings will be produced, and that is what the foundryman is interested in.

When Hot-Blast Cupolas Are Useful

With hot-blast cupolas there is a marked saving in coke. These have been operating with a coke ratio of 16 to 1, although the usual ratio is about 14 to 1. Whether the hot-blast cupola is applicable to a foundry depends on its size. If it is melting 50 tons or more a day, the hot-blast cupola can be used, but if only 10 tons is being melted, it is not applicable.

Temperature control is becoming a matter of importance in the foundry, he said, and market conditions are changing. Changes in flask and core equipment are working changes in production. The speaker believed it would be better for foundries to buy scrap according to definite specifications. Scrap may run 1.25 to 3 per cent in silicon. As a result, every ladle may vary in silicon content and good machineable castings may not be produced.

He said that the manufacture of pig iron in small pigs, as made by one Central Western furnace, is to the advantage of the foundry and that another has increased the uniformity of its product by tapping its blast furnace into large ladles.

Substitutes for Iron Castings

In the discussion B. D. Fuller, Cleveland, spoke of the loss to the foundry industry of many castings for various parts that are now made of rolled steel. These included high-test specialties for the automotive and other industries, for parts demanding strength and high-speed machineability.

Mr. Lowry attributed the substitution of steel for cast iron in many cases to the fact that the former has been properly advertised. Steel is no more uniform than cast iron, he said. Much work is being done in developing cast iron and in determining its qualities. When completed, some rather startling facts are likely to be brought out as to what cast iron will do. Engineers, he said, rate cast iron at a tensile strength of 15,000 lb., although test bars have been made with a tensile strength as high as 80,000 lb.

Apprenticeship Systems Urged

Closer cooperation between foundries and the public schools in working out apprenticeship systems was urged by Carl Cotter, director of vocational training, Toledo public schools, in a talk on vocational education. He pointed out that the Ohio compulsory education law has increased the high school enrollment, as it keeps boys in school who might otherwise be employed in industry. The Toledo schools have a foundry

with a 30-in. cupola and other equipment and an enrollment of 45 boys in that department, but he said it is hard to persuade boys to take the foundry course.

A comprehensive apprenticeship system under which the schools are to be tied up with various industries has been prepared in Toledo, but no action on adopting it has yet been taken by the Board of Education. Mr. Cotter said that the school board would be glad to work with the Ohio Foundrymen's Association in developing plans for apprenticeship training. In response to this offer the chairman stated that the Northwestern Ohio group of foundrymen would probably be pleased to take the matter up later.

President Smith in his annual report reviewed some of the activities of the association during the year. He said that one of the present aims is to promote a closer cooperation between pattern makers and foundrymen. He also said that work is being done with a view to effecting with other organizations a standardization of trade customs. The treasurer's report showed the association in a good financial condition.

Illinois Steel Plans Greater Expansion

Capacity in Chicago District Will Be Increased 2,500,000 Tons Instead of 1,500,000 Tons

THE Illinois Steel Co., subsidiary of the United States Steel Corporation, will add 2,500,000 tons to its annual capacity instead of 1,500,000 tons, as announced July 3 of this year.

Statement of this change in plans was made by James A. Farrell, president of the corporation, after a recent visit to the Illinois Steel Co. plants at South Chicago and Gary. New construction at the South Works will include 14 open-hearth furnaces, a new wide-flange rolling mill, a blooming and slab mill, two plate mills and an additional bar mill for rolling alloy steel bars. There will be built at Gary seven open-hearth furnaces, two batteries of by-product coke ovens of 70 ovens each, a blooming mill and a new strip mill.

Installation of the additional bar mill at the South Works will provide an annual capacity of 300,000 tons of alloy steel of all grades and sizes. This extension is noteworthy in view of the vast amount of work the Steel Corporation's research department has bestowed on alloy steels in the past year or two.

When the first expansion program announcement was made last July, it was estimated that the Illinois Steel Co. was planning to increase its productive capacity by 21 per cent and that capacity in the district would be enlarged by 15 per cent. Announcement that the Steel Corporation unit will expand by 2,500,000 tons annually brings these figures to 32 per cent increase for the Illinois Steel Co. and 25 per cent for the district as a whole.

The contemplated additions will produce more than the rated capacity of the largest independent producer in the Chicago district.

Soviet Engineers Select American Tools

Fifty-three Soviet engineers and industrial executives visited the recent National Machine Tool Exposition in Cleveland.

Mr. Markoff, vice-president of the Amtorg Trading Corporation, which arranged the attendance of the Soviet engineers, issued this statement at Cleveland:

"The reconstruction of Soviet industries on a modern technical basis, and the rapid realization of the great program of industrialization of the country have brought forth sharply the increasing importance of American machine tool production for Soviet industry. The year 1928-1929 marked the beginning of a widespread program of construction of new industrial plants. The work of designing the first large machine building plants, especially the two tractor plants in Stalingrad and Leningrad, an auto truck plant, Amo, in Moscow, an automobile plant in Nijni-Novgorod, an agricultural machinery plant, Selmachstroy, in Rostov, was, to a considerable degree, shifted to the United States. In this work the Amtorg Trading Corporation and the groups of Soviet engineers who have come from the Soviet Union have received the earnest cooperation of many American firms.

"The Soviet engineers came to the Cleveland exposition to study carefully the newest models of machine tools and the newest methods of production. Their purpose is to select proper equipment for the new plants now under construction in their country.

"During the exposition the Soviet engineers, with the assistance of Amtorg engineers and representatives of various American machine tool builders, have gone over their specifications and drawings and have made final decisions on purchases of equipment.

"During their short stay in Cleveland the representatives of Amtorg Trading Corporation have reached agreements with 28 firms to place orders amounting to about $1,200,000."

Mr. Markoff stated that the possibilities of export of machine tools to Russia are enormous, and that the winning of this market depends largely upon the foresight of American machine tool builders and the adoption of a more flexible policy.

Among the representatives of Soviet industrial organizations who attended the exposition were nine engineers of the Tractorstroi (Stalingrad Tractor Construction Bureau), headed by N. A. Kulikoff; eight engineers of the Autostroy (Automobile Plant Construction Bureau for Ford model car), headed by S. S. Dybetz, president of the bureau, and Mr. Isaacvitch, chief engineer; four representatives of the Gipromez (State Institute for Designing of Metal Works), headed by S. E. Weitzman, director of the Moscow division; Mr. Kuritzyn, chairman of the State Machine Building Trust; 10 engineers of the automobile producing trusts, headed by Mr. Golicoff, and five representatives of the Selmachstroy (Bureau for the Construction of the Rostov Agricultural Machinery Plant), headed by I. V. Sobolev.

The Amtorg Trading Corporation of New York, representing principal Soviet organizations, purchased during the past Soviet fiscal year ended Sept. 30, 1929, machine tools valued at about $5,200,000. This compares with purchases amounting to only $1,590,000 in the previous year. A total of 887 orders with 162 American machine tool firms were placed by the Amtorg during the past 12 months. The total Soviet-American trade for the past fiscal year amounted to $149,000,000, compared with $113,000,000 the year previous.

Production and Shipment of Raw Materials and Finished Products

	September, 1929	August, 1929	September, 1928

Demonstrates New Munitions of War

Army Ordnance Association Stages Spectacle with Representatives of Metal Trades Present

LATE developments in arms and munitions were exhibited and demonstrated at Aberdeen, Md., Oct. 10, at the Government's proving ground, under the auspices of the Army Ordnance Association. The association holds a meeting of this kind every fall and includes among its guests those who are likely to be called upon in a national emergency to design or manufacture war material. This year one of the participating organizations was the National Metal Trades Association.

As might be expected the demonstration was a continuous series of impressive spectacles, seeing that detachments from the ordnance department, the field artillery, the coast artillery, the air corps, the signal corps, the infantry and the chemical warfare service take part. The firing of guns, the attack on an imaginary enemy position by a mechanized ground force, attacks by aircraft and attacks on aircraft were extended into the darkness of evening.

Among interesting late developments shown may be mentioned the following:

Some of the New Developments

A combined wheel and track-laying chassis designed by Walter Christie, which made over 40 miles an hour speed over rough terrain and has gone as high as 90 miles an hour on a paved road. It serves as a high-speed armored car.

A light tank was shown powered with a 135-hp. 8-cylinder V standard commercial Cunningham motor. It has a 1-pounder gun of a new semi-automatic type which can fire at the rate of 40 shots a minute; combined with it is a machine gun so that the gunner has a choice of weapons depending on his target. This machine is regarded as the equal if not the superior of the older machines of greater size and weight. A company of 25 such machines is rated a fire-power per man roughly 16 times as great as any ordinary infantry company, besides which it can advance about ten times as fast and the men are protected by armor against enemy fire.

Bomb Tests Spectacular

A notable departure was exhibited in bombs. One lot dropped by airplanes are not put into action until they strike the ground. Then they set off a fragmentation part which rises a predetermined height and then bursts above ground. Their chief use is to spread gases and their certainty of action is independent of the height above ground of the aircraft dropping them.

One of the spectacular tests was the dropping of a 4000-lb. demolition bomb from one of the new Air Corps Curtiss Condor bombing airplanes, flying at an altitude of about one mile. This 2-ton bomb contained one ton of high explosive. It is 14 ft. long and 2 ft. in diameter and is equipped with two fuses, one in the nose and one in the tail. The fuses are so constructed that they may be set to function with instantaneous action on striking an object or so that the explosion will be delayed after impact, in order that the bomb may penetrate the desired distance before functioning. With a delay setting of a fraction of a second, this bomb makes a crater in normal soil 19 ft. deep and 65 ft. in diameter, displacing 1078 cu. yd. of earth.

Association Holds Short Session

At a short discussion meeting of the Army Ordnance Association, President Benedict Crowell, who was assistant secretary of war and director of munitions during the World War, emphasized that "the principal objective of the association is an active membership of American citizens, on whom the duty of design and production of munitions will fall in war, who will have an accurate and authentic knowledge of the complex requirements of ordnance. Peace insurance in this form is the foremost aim of the Army Ordnance Association."

Major-General C. C. Williams, chief of ordnance, addressed himself to the present status of munitions, touching at length on the recent experiences in welding in the construction of ordnance material and on the centrifugal casting of guns.

Harold C. Smith, president, National Metal Trades Association, spoke on "The Metal Trades and Preparedness."

Stock Sizes of Full Disk Buffs to Be Reduced

A general conference of representatives of manufacturers, distributers and users of buffing wheels, on Oct. 7, approved a simplified practice recommendation in which 4, 5, 6, 7, 8, 11, 13, 14, 17, 18 and 20-in. full disk buffing wheels were selected as standard stock items. This action reduces standard diameters from 17 to 11, corresponding to an elimination of 35 per cent of needless varieties. The conference also voted that 20 ply should be adopted as the standard for stock buffs, according to the division of simplified practice of the Bureau of Standards, Department of Commerce.

The recommendation is to become effective Jan. 2, 1930, for production on the new schedule, and Jan. 2, 1931, for the elimination of current stocks of non-standard sizes.

For the standing committee the following representatives were named: Manufacturers of buffs, B. H. Divine, president Divine Brothers Co., Utica, N. Y.; Floyd T. Taylor, vice-president Hanson-Van Winkle-Munning Co., Matawan, N. J.; and E. Winthrop Hall of the F. L. & J. C. Codman Co., Boston. Users of buffs, one representative each from the General Motors Corporation, the Western Electric Co., and the Scovill Mfg. Co. Distributers of buffs, a representative of F. B. Stevens Co., Detroit. Textile manufacturers, a representative of the Cotton Textile Institute. Machinery builders, a representative of the United States Electrical Tool Co.

Expect to Reduce Waste

It was the combined opinion of the conferees that the adoption of the above diameters as standards would materially reduce the wasteful cutting of sheeting out of which buffs are made and at the same time reduce the cost of production and distribution. The standing committee is to give further attention to the possibilities for standardization of sewing, arbor holes, pieced buffs and polishing wheels.

All-Metal Airship Accepted by Navy

WASHINGTON, Oct. 15.—The Navy Department has accepted the all-metal dirigible ZMC-2. Recommendation that the ship be accepted was made by the Board of Inspection and Survey, following test trials. The contract required that the ship fly at a speed of at least 60 miles an hour. In the tests it exceeded this rate but, it is stated, it has never been flown at its maximum speed. Among tests made were those to determine the ascending and descending qualities of the ship and to ascertain whether the metal covering is gas-tight.

Accepted as an experimental type, the ship will be subjected to extensive operating tests so that data may be gathered for purposes of comparison with fabric-covered ships. It will be used for training purposes also. It is anchored at the Lakehurst, N. J., station.

Ohio River Canalization Completed

Iron and Steel Can Move from Pittsburgh to Cairo, Ill.—Event to Be Celebrated Oct. 17

MOVEMENT of iron and steel and other products over the full length of the Ohio River from Pittsburgh to Cairo, Ill., will be assured the year around with the completion on Oct. 17 of the Government canalization project, which has been in progress for about 50 years at a cost of approximately $200,000,000. The work has involved the construction of 50 locks and a great deal of dredging work which will make possible a 9-ft. stage over the entire length of the river, regardless of weather conditions.

The official opening ceremonies, which will begin at Pittsburgh on Oct. 17, will take the form of a parade of river craft down to the Mississippi, with stops at important ports such as Huntington, W. Va., Cincinnati and Louisville, Ky. Pittsburgh's part of the celebration will begin with an informal luncheon at noon, which will be attended by many notables in Government, transportation and industrial circles. The various wharf and docking facilities in the Pittsburgh district will be thrown open for inspection during the afternoon, and in the evening a banquet will be held at the William Penn Hotel.

Among those who will be in Pittsburgh for the occasion are Andrew W. Mellon, Secretary of the Treasury; James W. Good, Secretary of War; Charles Francis Adams, Secretary of the Navy; Robert P. Lamont, Secretary of Commerce; James J. Davis, Secretary of Labor; Governor John S. Fisher of Pennsylvania; Governor William G. Conley of West Virginia; W. W. Atterbury, president, Pennsylvania Railroad; Daniel Willard, president, Baltimore & Ohio; P. E. Crowley, president, New York Central, and J. J. Burnet, president, Chesapeake & Ohio.

The Ohio River canalization project involved the construction of 50 low-lift dams, each with a lock chamber 110 ft. wide and 600 ft. available length. To prevent any increase in flood height and to permit open-river navigation when the natural depth is 9 ft. or more, all the dams except the two immediately below Pittsburgh, are of the movable type. Lock No. 1, at Emsworth, Pa., 6.2 miles below Pittsburgh, was built in 1921 to replace the old locks Nos. 1 and 2, and is of the fixed type of construction, the principal object being the elimination of the violent fluctuations of water levels in Pittsburgh harbor, which were caused by the operation of movable dams. A second fixed dam is now being completed at Deadman Island, 13.3 miles below Pittsburgh, which will replace the old dams Nos. 3 and 4. Its opening marks the completion of the project.

The main part of each movable dam, through which navigation passes when the dam is lowered, is known as the navigable pass. It is from 600 to 1000 ft. long and consists of a series of wickets or shutters, 3 ft. 9 in. wide and 16 ft. to 20 ft. long, depending on the height of the dam, each supported in an inclined position by a prop. The dam is lowered by means of a derrick boat, known as a maneuver boat, the props being released from their seats one by one, and the wickets lowered so as to lie flush with the bottom of the river. In addition to the lock and navigable pass, there are weirs of different types for the purpose of regulating the pools and facilitating the raising and lowering of the dam.

The relatively long construction period required for the dam building has been due partly to the fact that most of the work must be done within cofferdams designed to hold out the river to a stage of 16 to 18 ft. When the river rises above this stage, work must be suspended until the water subsides. With this limitation, the working season rarely exceeded five months, or from July to November, inclusive.

Coincident with the opening of the Ohio River project, bids were opened in Pittsburgh last week for the construction of lock No. 7 on the Allegheny River, the last of the existing project on that stream. The Allegheny is under improvement by the open channel method and also by locks and dams. The work under way provides for open channel work from the mouth of the river at Pittsburgh to the New York State line, a distance of 214 miles, by the removal of boulders and snags and the construction of low dams and dikes to close secondary channels and concentrate the low water flow on shoals. By these improvements there has been established a well defined navigable channel from 150 ft. wide and about 1 ft. deep at low water at the New York State line, to about 300 ft. wide and approximately 2 ft. deep at low water at Natrona, Pa., 24 miles about the mouth. The slack water project provides for eight locks and dams, establishing a minimum slack water depth of 7 ft. by three structures to Natrona and thence of 8 ft. by five additional locks and dams to Rimerton, Pa., 61 miles above the mouth.

The existing project on the Monongahela River provides for the improvement of the stream by 14 locks and fixed dams to afford slack water navigation from Pittsburgh to a point 4 miles south of Fairmont, W. Va., a distance of 130 miles. Work under the approved project will give a depth of 8 ft. between Pittsburgh and lock No. 10, near Morgantown, W. Va., and 7 ft. for the remainder of the distance. In rebuilding the locks and dams from No. 1 to 6, the adopted standard was two parallel chambers, each 56 x 360 ft., with 8 ft. depth on sills and fixed concrete dams.

German Foreign Trade in Iron and Steel Products

(In Metric Tons)

Item	Exports July	Exports August	Imports July	Imports August
Pig iron and ferroalloys	57,583	45,968	12,798	11,382

Based on cablegrams received by Iron and Steel Division, Department of Commerce, from Trade Commissioner James E. Wallis, Berlin.

Exports of Electrical Equipment

The Verband der Deutschen Elektrotechnischen Industrie has published a comparison of German exports in electrical equipment and appliances in 1923 and 1926. They totaled 330,000,000 m. ($78,540,000) in 1913 and 536,000,000 m. ($127,568,000) in 1926. Neverthless, Germany's share of total world trade in electrical equipment was only 28.8 per cent in 1926, compared with 46.4 per cent in 1913. The United States exported 112,000,000 m. ($26,656,000) worth of equipment in 1913, or 15.7 per cent of total world exports, and in 1926 shipped equipment valued at 448,000,000 m. ($106,624,000), or 24 per cent of the total. Great Britain's exports were 157,000,000 m. ($37,366,000) in 1913, or 22 per cent of the total, and 377,000,000 m. ($89,726,000) in 1926, or 20.2 per cent of world exports.

Steel Corporation's Orders Gain 244,370 Tons

A gain of 244,370 tons in its unfilled orders was reported for September by the United States Steel Corporation. This contrasts with a decrease in August of 429,966 tons which was the fourth consecutive monthly decline. The total on Sept. 30 was 3,902,581 tons as against 3,658,211 tons on Aug. 31. A year ago the unfilled tonnage was 3,698,368 tons; on Sept. 30 this year the orders are 204,213 tons larger than a year ago.

Unfilled tonnage at the end of each month for the past three years follows:

	1929	1928	1927
September	3,902,581	3,698,368	3,148,113
August...	3,658,211	3,624,043	3,196,037
July.....	4,088,177	3,570,927	3,142,014
June.....	4,256,910	3,637,000	3,058,246
May	4,304,167	3,416,822	3,050,941
April.....	4,427,563	3,872,133	3,456,132
March ...	4,410,718	4,335,206	3,553,140
February..	4,141,341	4,398,189	3,597,119
January..	4,109,487	4,275,947	3,800,177
	1928	1927	1926
December.	3,976,712	3,972,974	3,960,696
November	3,673,000	3,454,441	3,807,447
October ..	3,751,030	3,341,000	3,683,661

Farm Market for Galvanized Sheets Is 1,599,533 Tons

The total annual farm market for galvanized roofing is 1,599,533 tons, whereas the present quantity of galvanized sheets going into that market is only 429,000 tons, states the current issue of *Making Markets*, published by the Sheet Steel Trade Extension Committee, Cleveland. Approximately 474,533 tons is required for new construction, the remainder being needed for replacement purposes.

Recovery in Pig Iron Imports in August

August imports of pig iron from British India alone made more tonnage than the total in July from all countries. At 12,377 tons the gain was 84 per cent on the 6743 tons of July. The August figure showed a reduction from August last year of about 5 per cent.

For the first eight months of the year there has been a slight decline from last year—about 2 per cent. United Kingdom and British India remained the leaders, as a year ago, but India has taken first place, whereas last year United Kingdom was in first position. The Netherlands has been third each year, and no country outside these three supplied as much as 3 per cent of the total in either year.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT
(In Gross Tons)

	August		Eight Months Ended August	
	1929	1928	1929	1928
United Kingdom	3,903	2,550	31,187	37,327
British India	7,227	7,495	37,786	34,269

All others	65	32	572	1,541
Total	12,377	12,990	92,581	94,340

Expansion of Interstate Mills Being Planned

F. J. Griffiths, chairman of the board, Central Alloy Steel Corporation, in submitting the third quarter earnings report of the company, stated that the work of transferring the properties and other assets of the Interstate Iron & Steel Co. of Chicago to Central Alloy is proceeding rapidly and that plans are under way for expansion of the Interstate plants.

The Central Alloy Steel Corporation reported third quarter earnings of $1,342,974, after all charges but before dividends, equivalent to 90c. on each share of common stock outstanding. Earnings in the September quarter of 1928 were $1,160,606, equal to 76c. a share on the common. Earnings for the first nine months of this year were $4,667,251, after all charges but before dividends, equal to $3.19 a share on the common, against $3,400,965, or $2.22 a share, on the common in the first nine months of 1928.

The Interstate Iron & Steel Co., Chicago, which, as was announced in THE IRON AGE of Oct. 10, will be merged with the Central Alloy Steel Corporation, Massillon, Ohio, was incorporated in 1895 and operates three plants in the Chicago district. These are an alloy steel mill at South Chicago, Ill.; a rod and wire mill at Grand Crossing, Chicago, and an iron bar mill at East Chicago, Ind.

Equipment at the South Chicago Works includes four 100-ton open hearth furnaces, four 70-ton open hearth furnaces, a 35-in. blooming mill, a 21-in. Morgan continuous billet mill, a 12-in. Morgan finishing mill and a 10-in. Morgan finishing mill. Plans have been prepared for an additional 100-ton open hearth furnace at this plant. The rated capacity at South Chicago Works is 375,000 tons annually.

Equipment at the Grand Crossing Works includes a continuous rod mill with an annual capacity of 60,000 tons. Products are wire, both black and galvanized, nails, welding rods, tacks and staples. At the East Chicago Works are four three-high mills with a total capacity of 125,000 tons annually. The sizes of these mills are 8-in., 9-in., 16-in. and 22-in. The products are bar iron and steel and iron tie plates. There are also located at this works heat treating and cold-drawing departments.

The Interstate Iron & Steel Co. last year sold its rivet manufacturing business and it has also discontinued production of double-threaded wood screws.

Alloy Steels Discussed at Hartford Meeting

At the first meeting of the season of the Hartford chapter of the American Society for Steel Treating on Tuesday evening, Oct. 8, at the Hartford Electric Light Auditorium in Hartford, Conn., the subject was "The Manufacture of Alloy Steel." It was introduced by a five-reel motion picture presented by the Central Alloy Steel Corporation of Massillon, Ohio. A representative of the company answered many questions covering the pouring of ingots, the relation between the sizes of ingots and the intended product, the causes of seams and other internal defects found in finished bars, and methods of rolling and straightening. Various types of stainless irons and their product were described.

At the next meeting, on Nov. 12, the speaker will be J. P. Gill, chief metallurgist, Vanadium Alloys Steel Co., Latrobe, Pa., who will discuss "Alloys and Their Effects in Tool Steels."

Westinghouse to Furnish Drives for Chicago Mill

The Westinghouse Electric & Mfg. Co. has received the contract for the main roll drives of the new wide flange structural mill of the South Chicago works of the Illinois Steel Co. The value of the contract is approximately $1,250,000.

According to the Westinghouse announcement, the equipment will include the first application of the twin motor direct drive, which is an outstanding new development in rolling mill practice. In this installation the upper and lower rolls are driven by direct-connected individual motors, eliminating the pinions and housings which are required by conventional single motor drives. The electrical equipment for the new twin motor drive consists of two standard reversing motors, each of half the capacity required for a single motor drive, a motor-generator set and the necessary control and switching equipment.

The Hill-Curtis Co., Kalamazoo, Mich., manufacturer of grinding and polishing machinery, has changed its name to Hammond Machinery Builders, Inc.

Buyer Says Scrap Trade Must Improve Background

Cooperation of the American Rolling Mill Co. in bringing about better conditions in the scrap industry was offered to the Institute of Scrap Iron and Steel at a meeting of its Cincinnati chapter Oct. 8 by H. O. Miller, director of purchases of the steel company. Mr. Miller said:

"For the last 25 years it has been a hope of mine that the scrap iron dealers would accept the responsibility of creating a new background for their industry. Scrap is the only commodity we buy in which we need inspectors. I have been firm in the belief that the business will have to change from a speculative to a more substantial basis.

"I have been watching the institute closely and feel that it is on the right foundation to create this new background for the industry. I have read with a great deal of interest the high class publicity that has come out and the constructive work of the organization. I want to see the institute succeed, and any help I or my company can give will be given.

"We are concerned not only in keeping the good will of our sources of scrap, but in eliminating the causes which eventually mean losses to us. The dealer's loss in reshipment on account of rejected cars will eventually be made up out of our company or some other consumer. The institute can do a great deal to eliminate the causes of these losses. Brokers should inform the shippers of our specifications.

"Every scrap iron dealer in the country can afford to be a member of the institute. I wonder how many of the dealers who have already joined have done anything more than subscribe? Passive acceptance will kill the institute."

Mr. Miller was elected an honorary member of the Cincinnati chapter.

New England Steel and Iron Jobbers' Outing

The New England Iron & Hardware Association held its annual fall outing at the Tedesco Country Club, Swampscott, Mass., on Thursday afternoon and evening, Sept. 19. It was the largest outing ever held by the organization, more than 100 members and guests attending, and more than 50 entered the golf tournament. Franklin E. Bragg, N. H. Bragg & Sons, Bangor, Me., president of the association, presided at the dinner, and introduced Harry L. Doten, president, H. L. Doten & Sons, Boston, who awarded the prizes won during the tournament.

Prizes were donated by the Central Alloy Steel Corporation, Boston; F. S. Brewer, Bourne, Fuller Co., Unionville, Conn.; Bethlehem Steel Co., Boston; American Steel & Wire Co., Boston; Peter Gray & Sons, Inc., Cambridge, Mass.; Ames Shovel & Tool Co., North Easton, Mass.; Decatur & Hopkins Co. and Bigelow & Dowse Co., Boston; the president, Mr. Bragg; and the Standard Horseshoe Co., Boston.

Prizes were won by C. M. Doten, H. L. Doten & Sons, Boston; Murray Harvey, A. C. Harvey Co., Boston; Paul Avery, Avery & Saul Co., Boston; A. E. Carpenter, Chase, Parker & Co., Boston; R. H. Sanderson, E. P. Sanderson & Co., Cambridge, Mass.; C. C. Butts, Butts & Ordway Co., Boston; Arthur Avery, Avery & Saul Co.; W. C. Gray, Peter Gray & Sons, Inc.; Peter Gray; and J. S. Kenyon, Tremont Nail Co., Boston.

$2,000 for Best Industrial Advertising Campaign

Again the Harvard Advertising Awards Committee of the National Industrial Advertisers Association is announcing the annual Bok Award of $2,000 for the best industrial advertising campaign for 1929 appearing in newspapers and periodicals. Closing date of this competition is Dec. 31.

The industrial advertiser must submit a manuscript describing the campaign, its functions, and its application, together with reproductions of the ads as they appeared and a statement of the analysis of the market on which the campaign was founded. The manuscript and the ads must be submitted in certain prescribed form, the details of which can be secured direct from Harvard Graduate School of Business Administration (Harvard Advertising Awards), Soldiers' Field Station, Boston, or from A. H. Oberndorfer, Chairman Awards Committee of the National Industrial Advertisers' Association, in care of the Sivyer Steel Casting Co., Milwaukee.

Municipal Airports to Be Subject of Conference

Engineers and city officials of the American Road Builders' Association and members of the Aeronautical Chamber of Commerce will hold a conference on municipal airports in Washington on Oct. 24 and 25. The technical side of the program will include airport layout and planning, structures, drainage, surfaces and management. Lieutenant-Colonel U. S. Grant, III, director of public buildings and parks, District of Columbia, will deliver an address on "Airports and Public Parks," and Colonel C. M. Young, newly-named assistant secretary of commerce for aeronautics, will discuss European practices.

A Virginia Blast Furnace Sold for Scrap

The Bigstone Gap blast furnace of the Intermont Coal and Iron Co., at Bigstone Gap, Va., which was blown out a few years ago, has been sold to Platnik Brothers, Bluefield, West Va., who are now dismantling it for junk.

Cold-Drawn Bar Makers To Hold Conference

WASHINGTON, Oct. 11.—With approximately 70 to 75 per cent of the total production represented, the cold-finished steel bar industry will hold a trade practice conference with the Federal Trade Commission at a date and place not yet determined. It will be in charge of Commissioner C. W. Hunt. Among subjects thus far proposed are: Interference with contractual relations; defamation; espionage; price discrimination; premiums; misrepresentation; secret rebates; protection against decline or advance in price; failure to adhere to published prices and failure to maintain the validity of contracts.

The Southern Hardware Jobbers' Association also will hold a trade practice conference with the commission on Oct. 18 in Washington at the Chamber of Commerce of the United States before Commissioner G. S. Ferguson, Jr. Applications for the conference represent approximately 90 per cent of the hardware distributing industry in 14 Southern States. Among practices proposed for discussion are: Price discrimination; inducing breach of contract; misbranding; fraud and misrepresentation and secret rebates.

Foundry Labor Looking for Higher Wages

Cutting costs in a jobbing foundry was the subject selected by F. D. Campbell, Eastern Steel Castings, Newark, N. J., for his address at the October meeting of the New England Foundrymen's Association at the Exchange Club, Boston, Oct. 9.

The working space of the plant approximates 100,000 sq. ft., the average weight of castings produced is 20 lb., as high as 6 tons of metal is put into the molds in 9 min., all the result of high concentration of appliances. The company recovers 80 per cent of its defective castings at its shakeouts, which means a tremendous saving in subsequent handling departments. Of particular interest were the illustrations which he showed of sand hoppers equipped with automatic lubricated vibrators.

Carl S. Neumann, president of the New England association, presided and first introduced A. E. McClintock, National Founders Association, who gave a brief sketch of what the foundry labor situation is and is likely to be during the next six months or so. He stated that great pressure is being brought to bear on the president of the iron molders' union to start some sort of movement to lessen working hours and increase the pay in localities not receiving $1 an hour.

So far as can be ascertained, the foundry union intends to start next spring a general movement for a five-day week and $1.25 an hour wage with the hope of ultimately securing $1.10.

This Issue in Brief

Daily production meeting helps manufacturer keep delivery promises. Orders are assigned to various departments, delivery dates are set, production record is discussed, and delays are investigated.—Page 1033.

* * *

Don't pile coal higher than 12 ft., if spontaneous combustion is to be avoided. Soft coal should not be stored in damp spots. Air spaces should be eliminated by tamping.—Page 1041.

* * *

Business collapse is not likely to result from stock market deflation. Industry and trade are free from inflation, says economist. No serious business depression is in prospect, if industry has not in general overestimated market requirements. —Page 1034.

* * *

Cuts costs almost in half by annealing magnetic sheets in electric furnace, filled with non-oxidizing gas. Oxidation is prevented. The sheets come out clean. Stickers are eliminated.—Page 1037.

* * *

If your plant burned down tomorrow insurance would not repay you for lost customers. Every industrial manager should study fire-prevention methods. Every plant should have at least one fire squad, and fire prevention equipment should be tested regularly.—Page 1041.

* * *

If your foundry melts more than 50 tons daily you can save money by using the hot-blast cupola, says foundry engineer. Hot blast makes a big saving in coke. The usual ratio is 14 to 1. —Page 1047.

Determines cost of operating open-hearth furnaces with various grades of scrap. Block scrap has the highest value and detinned sheet the lowest.—Page 1026.

* * *

Use carefully drawn stock for cold-heading and thread-rolling. If split threads occur, the wire was not drawn enough.—Page 1027.

* * *

Forging furnace brick lasts longer and heat is conserved if the walls are treated with "Albany slip." Finely ground powder suspended in water is sprayed over the cold brick and left to dry.—Page 1028.

* * *

Bonus for analysis control is paid steel foundry melters. Bonus is based upon a score obtained by dividing the total number of points outside the desired analysis by the total number of heats. —Page 1030.

* * *

New big market for equipment and steel will result from building of passenger terminals at airports. Practically no facilities exist at present. Air depot will follow closely the methods used in modern railroad terminals, engineers believe.—Page 1023.

* * *

Forging quality is not influenced by presence of dendritic structure. In the forged and heat-treated condition, no material difference can be detected in the tensile properties, so investigator concludes that the microstructure and not the macrostructure is the dominant factor.—Page 1028.

Before accepting car of scrap a 1000-lb. test heat is made, prior to unloading car. Test piece is analyzed, and used as a basis for acceptance or rejection, and also for placing the scrap in its proper bin, according to analysis.—Page 1029.

* * *

Heading dies for cap screws, machine screws and rivet blanks last longer if wire is liquor-finished. The copper sulphate wash fills in seams and pores on the wire surface.—Page 1027.

* * *

By glazing the walls of furnace for annealing steel castings, good heat reflection is obtained, and equality of temperature between furnace walls and contents is promoted.—Page 1028.

* * *

Heat treating increases the tensile strength of cold-headed bolt blanks and refines the metal structure. Water-quenching is a good toughener.—Page 1027.

* * *

Unfilled steel orders show first gain since April. Steel Corporation's balance on order Oct. 1 was 3,902,581 tons, a gain of 244,370 tons.—Page 1051.

* * *

Boiler shops are working to closer limits. Rough-and-ready methods have been superseded by machine shop precision. Twenty years ago ½ in. out-of-round would go uncriticized. Today 1/16 in. out-of-round is about the maximum allowable.—Page 1055.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

How Is General Business?

CONFRONTED with a decline in steel production when the normal seasonal trend is upward, and observing that there is a wide difference in the degree of activity in various consuming lines, the steel trade wants to know what is the real condition and trend in general business. In various respects there is confusion of testimony, particularly when different periods of time are taken for comparison. Thus, while "the year to date" compared with the same period in the preceding year has usually been a favorite basis for comparison, that fails to be informative at the present time, for the real question is whether any important change has occurred recently. This difficulty is increased by the fact that last year had its parts out of proportion, the second half being unusually good relative to the first half, which would set this year's comparisons with "a year previous" awry.

As to the validity of the steel trade's own showing, that of production, there is necessarily some doubt. When June, July and August showed 25 per cent heavier production of steel ingots than the same months of last year the increase could not be accepted as a general measure. Men's habits as to working in the summer and wanting steel could not be so greatly altered. There were then belated deliveries, while there might now be a temporary reaction to the other side of the general line.

We have selected three general measures or indicators of trade at large, to see what they suggest. The comparison covers only the recent past, not a large part of this year, for the question is whether any significant change has occurred recently. It develops that check payments in four weeks, freight car loadings in four weeks and Portland cement shipments in two months show increases from a year previous, 11 per cent in check payments, 3 per cent in car loadings and 1 per cent in cement shipments. The comparison is with what may be called the better part of last year.

These three general measures make a reasonably favorable comparison. In two important activities we have a different showing. Building contracts in eight weeks decreased in value 15 per cent from a year previous. Automobile production last month was below that of a year previous, making an impressive divergence, as previous months this year had run higher than a year previous, most of them very much higher.

It is easy to give too much regard to these individual instances. There is so much income or so much capital available, and the choice of how the money is spent may easily vary from time to time. One readily recalls complaints of clothing and shoe manufacturers that people were spending too much money on automobiles.

The decrease in automobile trade activity is measurable and it accounts for the greater part of the falling off in total steel production, while there has been a seasonal decrease in rail production that accounts for much of the remainder. It is evident that there has been no widespread decrease in the demand for steel even though the demand was exceptionally heavy earlier in the year. Many of the consuming trades must still be doing very well indeed.

Uncle Shylock

IT is notorious that Uncle Sam, exercising his attentive hand through the medium of bureaucratic nurses, mentors and policemen, is not very good to his nephews and nieces. We even forget that he is our uncle at all, so threatening, meticulous, and even confiscatory is he at times. Since the progressive, or we should say the bilious, senators have got ideas of their own about predatory wealth he seems to have become even harsher. Uncle Sam is no story-book uncle. Indeed, we may even be tempted to accept the European characterization of Uncle Shylock.

Every one who does business with Washington knows the trials and tribulations of it, especially in matters of contracts. In the matter of tax-gathering the contact has become even broader. The sour-grape politicians raise a rumpus every now and then over occasional income tax refunds, which we may be sure would never be made unless they were clearly due. Quite likely the Government trims its citizens more often than the other way around.

One of our friends who had to pay a large income tax discovered, after payment of the first installment, that his clerks had made an error in computation. So an amended return was filed, the data remaining exactly as originally reported, but the tax being recomputed. He was required, however, to continue his installments in accordance with the original, erroneous filing. After many days he received a refund, but he was out of pocket the interest on his overpayment.

Perhaps there have been even more quarrels over payment of duties on goods brought home by travelers abroad. The ungenerous law allows each person free entry of $100 worth. Many travelers have raised the question what is $100 worth. The law says wholesale value, but the inspectors and appraisers on the wharves have said retail value and have demanded of the victim to exhibit his bills of sale. If the victim has made an estimated discount to reduce to wholesale value he has been doomed to trouble.

The commissioner of customs has recently ruled

that incoming travelers who have known the law have had the right interpretation of it, and it follows that the great majority who have been ignorant or browbeaten have been overpaying Uncle Sam to the extent of some millions per annum. It is next to impossible, of course, to ascertain the wholesale or manufacturing value of the numerous trinkets and articles of clothing that tourists purchase abroad, and so comply with the letter of the law, but the traveler who is experienced in chaffering in Continental shops is pretty sure that what he finally pays is somewhere from plus 50 to plus 100 per cent.

World Steel at New High

NOT alone in the American steel industry is production on the increase this year. An analysis of the rate of steel output of five other leading countries shows that in each one there has been a substantial increase during the first half of this year. Production to July 1 of the six foremost producers, compared with the half-year outputs of 1928 and 1913, was as follows in thousands of gross tons per month, according to the compilation of the National Federation of Iron and Steel Manufacturers of Great Britain:

Monthly Steel Output for First Six Months

	1929	1928	1913
Great Britain	813.8	710.4	638.6
United States	4,828.0	4,154.8	2,608.4
Germany	1,365.6	1,190.8	1,445.7
France	790.2	769.8	384.5
Belgium	334.6	322.8	202.3
Luxemburg	215.8	211.0	109.0
The six	8,348.0	7,359.6	5,388.5

Thus at 8,348,000 tons per month to July 1, this year's rate is roundly a million tons, or 13 per cent, larger than the 7,359,600 tons per month in 1928. It is 55 per cent in excess of the rate of 1913.

While the American increase has been large—16 per cent to July 1 over 1928—the British have also made a good showing at 14.5 per cent. Germany has done equally well, having an increase of 14.7 per cent over 1928, but this is accounted for in part by a strike at the end of 1928. The gain in the other three countries has not been so large.

While the remainder of the year may not realize so large an increase as the first half—it certainly will not in the United States—the year's output for these six will possibly exceed 100,000,000 tons, compared with 88,315,200 tons for 1928—an increase of over 13 per cent. This year's showing is emphatic witness to the fact that the European steel industry has recovered from the war and is now headed toward prosperity. This is true of Russia, as well as of Poland, the Saar and Italy.

Length of Business Calls

HOW often is the length of a business call unsatisfactory to both the parties involved. The matter is a delicate one, for the fact that the visitor has taken extra time to make the visit, perhaps an overnight railroad journey, makes him in one sense the more important person of the two, though commonly that distinction is held by the other party to the conversation. But men who receive such visitors usually have many to see and that fact must also be taken into account. Wide differences are to be observed in the manner in which different men handle their visitors. Some have the knack of unobtrusively suggesting the time the caller is expected to spend or the proper scope of the conversation.

When a visitor has a long wait he is in one of two frames of mind when finally admitted. Either he is in a bad humor, which makes the visit less satisfactory to both parties, or he is in a mood, having seen others take so much time, to take his full share also. Of course, calls can be cut short unceremoniously, but that is not a good way to handle the matter. Obviously the call should leave no unpleasant recollection in the mind of either party.

It is assumed that nowadays the business calls that are made are necessary, involving only cases in which the mail, the telegraph or the telephone is inadequate. That makes them important, not mere routine to be gone through with somehow, and skill on both sides is called for in handling the matter. Every one observes how often there is a lack of skill. The office man may sometimes wish a given visitor would stay longer—certainly he wishes many would not stay so long—and the visitor on his part sometimes wishes he could have finished and got away again in less time.

Riveted Joints, Also, Are Better

ONE might imagine, from the plethora of matter on welding which has been carried in technical and engineering journals, and the relative silence from competitive processes, that the art of riveting was not progressing to any appreciable extent. That such a presumption does not correctly picture the situation, and is due to the lack of colorful news in an established industry, is immediately apparent to a visitor in a modern boiler works, particularly in one which makes drums for the higher pressures and superheats now installed in central stations.

Such an observer, remembering shop practices of 20 years ago, when inch plate was very heavy work, and ½ inch out-of-round would cause no criticism, opens his eyes at the close limits attained with the more precise machinery now available, even when working on much thicker and stiffer material. In fact, the rough and ready methods of the old-time boiler shop have been entirely superseded by machine shop precision. It is not surprising, indeed, to find that many of the foremen are men of machine shop training.

Refinements in boiler manufacture all point toward closer fitting. The thicker the plate, the more necessary is it that the shape should be correct (to avoid secondary stresses from the increased pressure), and that the fitting should be snug (to prevent leaks or infiltration of embrittling solutions). Consequently one sees the most meticulous care in the bending presses and rolls—1/16 inch out-of-round is about the maximum allowable. Edges are milled to correct angle; butt straps and faying surfaces are cleaned, ground and stoned to a paper fit. Bolts in unusual number are used for assembly prior to drilling the rivet holes; drilled holes would sometimes be reamed for a smoother surface and all burrs removed by a slight countersink. Rivets are machined on the shanks and under the head. Ground shanks are even resorted to for work to withstand the highest pressures, with clearances between the hot rivet and hole on the order of 0.01 inch. Imagine, if you can, what would have greeted a specification in 1900, calling for clearance of

1/32 inch in a 1½-inch rivet. It just simply wasn't done. That close fits are really necessary nowadays is indicated by the general practice of machining the skirts of the forged drum heads, turning the inside of the completed drum, and heating the latter mildly for a shrink fit over the head.

While many of these refinements have to do with boiler details other than riveting, the use of turned and ground rivets is in keeping with precision, the general order of the day. Riveting machinery has also been improved in step with advances in other machine tools, not only increasing in power and reach, but in adaptability and ease by which a drum weighing several tons can be moved a fraction of an inch to bring the head-forming dies or snaps in exact line with the center of the rivet hole. Such developments are matched in other plants using lighter thicknesses of metal in mass production, by machines making their own rivets and driving them cold at high speed, or shooting a pre-formed rivet into its hole by a compressed air gun.

No one familiar with the facts can doubt that the quality of the riveted joint made today is better than that of twenty years ago. Even its welding-minded competitors must admit that the riveting machine is extremely efficient (in the sense of cheap to operate) because such a complicated series of operations as laying out, punching and reaming or drilling the holes, assembling, and riveting the seam can still in most cases be quoted at a less price than merely assembling and welding. That in itself is proof that the art of riveting and the manufacturers of riveting machines have been progressing.

Prolonged Activity in Building

ALTHOUGH building construction permits have continued to decline (September making one of the poorest showings of the year, as reported by the F. W. Dodge Corporation), the types of structure that require heavy steel shapes remain an outstandingly strong support of the steel industry. The falling off this year, as compared with 1928, has been mostly in small-type residential buildings. Large work has been going ahead at an almost unprecedented pace, particularly in the New York district.

Figures compiled by the Structural Steel Board of Trade of New York show that in the nine months ended Sept. 30 the steel fabricators of the metropolitan area booked 423,501 tons of structural work in buildings alone, as compared with 458,259 tons for all of last year. Records are not kept by the Structural Steel Board of Trade on so-called civil engineering work, such as subways, bridges and elevated highways, but unofficial records indicate that the awards of steel for such work this year have fully equaled the tonnage used for buildings.

A large volume of new projects in New York is now in contemplation. THE IRON AGE last week reported that 63,000 tons had been inquired for, an unusually high weekly total. Large-scale work, some of which may not actually come into the market until next year, is in prospect. Included are the Metropolitan Opera House project, taking in two city blocks on Fifth Avenue; the Cornell medical center, the first units of which are now calling for 18,000 tons of steel, and a continuation of the city's subway program, with 100 additional miles of lines to be constructed within the near future.

With such enormous projects as the new Empire State Building, to be erected on the site of the old Waldorf-Astoria Hotel, requiring 40,000 tons of steel and itself constituting a city of office workers, and other buildings now in course of construction, some towering 60 stories or more, it may well be wondered whether New York office space will not soon reach the point of over-saturation. However, the constantly ascending scale of property valuations which such improvements bring to all surrounding sites, together with the better utilization of the less accessible sections which comes with new subway construction, will make necessary continuous rebuilding in New York to make investments profitable.

While special conditions prevail in the metropolitan district, because of its large and concentrated population, an approach to the New York situation is seen in some other cities in varying degrees. Chicago has pushed its business area well north of the Chicago River, breaking away from the limitations of its Loop district; Cleveland has undertaken a major reconstruction of its business area centering about the new union railroad terminal; Detroit business is moving miles up Woodward Avenue nearer to the large structures erected by the General Motors Corporation and the Fisher Brothers; Philadelphia is entering upon an era of rebuilding its business district, which will follow improvements now under way by the Pennsylvania Railroad.

Bookings of fabricated structural steel, as computed by the Department of Commerce, have run about 16 per cent ahead of those of 1928 for the country as a whole. In New York the indications are that steel for buildings for all of this year will take fully 25 per cent more than the 1928 total and possibly as much as 30 per cent.

While the outlook for a continued high rate of building construction is clouded somewhat by the money situation, this year's large-scale operations have gone on in spite of high money and the use of vast sums in the carrying of securities. A favorable indication of late is a revival of interest in the bond market. In the past this has been a sign of the return of money rates to a basis that would encourage investment in building construction.

Production Appears to Be Above Distribution

Industrial activity as a whole continues to make a more favorable showing than distribution, either at wholesale or retail. Although this statement must be made with full recognition of the incomplete and sometimes unreliable character of available data, it seems to be warranted by comparisons with past records. This is a situation commonly regarded as unfavorable in its bearing on the outlook for business, since it is taken to indicate that goods are being produced in response to a demand partly speculative, and is accompanied by a gradual accumulation of commodities in dealers' hands.

Something of the kind may be taking place in certain directions. It is suggested by the increase in dealers' stocks of automobiles, the market situation in certain branches of the textile and building-material industries, and similar conditions here and there in other parts of the business structure. While the heavy industries have

been making a series of new high records, the general level of trade, as measured by such standards as railroad freight loadings, bank debits, department store sales and the like, has followed approximately a normal course. Under such conditions, it would not be surprising to find that inventories in general were somewhat larger than a year ago.

If such a condition exists, however, it is not reflected in the usual ways. The level of commodity prices shows not the slightest trace of inflation; the transportation situation is excellent; there is no shortage of labor in most industries; and no conclusive evidence exists that stocks of goods in general are greatly above normal in relation to output and demand. Moreover, the general attitude of business men as to the probable course of trade in the next few months is unquestionably optimistic. —*Guaranty Survey.*

Business Survey Reveals Good Conditions

Industry throughout the country at the present moment is just a shade more favorably situated than it was a year ago, but numerous individual industries show recessions from their position last year, according to the annual trade survey of the National Association of Manufacturers, presented at the annual meeting in New York this week by J. Lewis Benton, general secretary of the organization.

A questionnaire, covering present trade, prospects for winter, comparison with last fall, production, sales quantities and values, employment, wages and labor conditions, was sent to 3000 members of the association the first of this month, with request that the report be made as of Oct. 4. The tabulation was closed Oct. 7, at which time nearly 1000 replies had been received. The survey covers a compilation of something more than 9000 detailed answers.

Taking the industries as a whole, of the companies reporting, 19 per cent class their present business as excellent; 45 per cent good; 31 per cent fair and 5 per cent poor. Last year they were classified, 17 per cent excellent; 41 per cent good; 34 per cent fair; 6 per cent poor. Prospects for the winter are regarded as excellent by 12 per cent; good by 54 per cent; fair by 30 per cent; poor by 4 per cent; while last year 14 per cent reported excellent; 43 per cent good; 36 per cent fair and 6 per cent poor.

Comparing the business done up to this fall with the same period last year, 53 per cent report better returns; 17 per cent less and 30 per cent find no change. A year ago the report was 50 per cent better; 25 per cent less; 25 per cent no change.

The Allis-Chalmers Mfg. Co. has received during the past week orders covering heavy power plant equipment for three utility companies, aggregating approximately $2,000,000.

The Week in Business

Drift of Current Financial and Economic Opinion

RECOVERY of the stock market, lower call money rates and a reduction in brokers' loans after seven weeks of continued expansion were marked developments of the past seven days.

Stocks regained two-thirds of the ground lost in the preceding month, but opinion still is divided regarding the next phase of the movement, according to Paul Willard Garrett, New York *Evening Post.*

Call Money Lowest in 14 Months

The drop in call money to 5 per cent, the lowest official figure for 14 months, is ascribed to various factors, among them the favorable position of the Federal Reserve banks, the buying of acceptances, the let-up in business activity and the loaning on call of large funds held by investment trusts. But the main cause, in the view of Alexander D. Noyes, New York *Times,* was stock market liquidation. He recalls the decline from 20 per cent to 6 per cent last March and the drop from 12 to 6 per cent last December. On both occasions resumption of speculation quickly drove up the rate again to 12 and 10. (On Monday, Oct. 14, it was 6 per cent.)

Decline in Brokers' Loans Sub-normal

The decline in brokers' loans—$91,000,000—was the least favorable omen, in Mr. Noyes's opinion, since previously a loan reduction of $120,000,000 to $220,000,000 in a week has always followed a roundup of stock market liquidation.

Reduced lending by banks more than accounted for last week's decline, as loans from "others" showed a further gain.

Appraisals of the credit situation are giving increasing attention to Federal Reserve policy. With the Reserve ratio at the high level of 74.4 per cent for the week ended Oct. 9, compared with 67.6 per cent one year previous, it is evident that more credit can easily be granted if the Reserve authorities so choose. Since the middle of July, says the *Annalist,* reserve holdings of acceptances have expanded more than $250,000,000 (corrected for seasonal variation). In fact, purchases of bills, in the view of Wade Brothers & Co., New York, are beyond ordinary seasonal needs.

Credit and Stable Commodity Prices

Control of credit by the Reserve Board may not have succeeded in harnessing stock market speculation, but it has undoubtedly been an important factor in preventing commodity price inflation.

In pre-war years an inflow of gold was usually attended by rising commodity values. But the increased imports of 1929 have been negatived by a contraction of Reserve credit. The level of wholesale prices during the year, according to the Alexander Hamilton Institute, has dropped some 2½ per cent.

American Buying Power Undiminished

With the more reassuring outlook in the money market has come a more sanguine view of business. "It is absurd," says Theodore H. Price in *Commerce and Finance,* "to maintain that American prosperity is conditioned upon a constant and unvarying gain in its business or industrial output. The truth is that the buying power of our wage earners and our agricultural workers is about as high as it ever was in the history of the country."

Meanwhile freight car loadings, for the week ended Sept. 28, were the largest this year, and shippers' advisory boards forecast heavier traffic in the current fourth quarter than last year for all but three out of 13 districts.

Recent relaxation in business activity has been chiefly due to a sharp drop in automobile production. L. A. Miller, president of the Willys-Overland company, states that manufacturers have shipped cars to dealers in excess of the purchasing power of their communities, resulting in an acute used car problem. New car stocks, on the other hand, have shown a downward trend in the past few months, according to *Automotive Industries.*

Iron and Steel Markets

Industry in Transition Period

Steel Producers Adjusting Themselves to Drastic Reduction in Automotive Demand—Banner Week in Railroad Car Orders

WITH further retrenchment by motor car manufacturers as they prepare to bring out new models, steel shipments to the automobile industry have reached the lowest point in 18 months. The reduction in demand from this major customer of the mills has been too drastic to be offset by the heavier requirements of the railroads, impressive as they are.

A failure to foresee the severity of this reaction, coupled with continued pressure for business volume, has caused wider unsettlement of the price situation, with dips in extreme cases of $2 and $3 a ton below market levels that prevailed 60 days ago.

The present problem of the steel industry is to adjust itself to a curtailed, though by no means low, scale of activity. It is perhaps significant that steel makers are increasingly concerned with gaging the duration of the present lull in automotive demand. While it is reported that the Chevrolet Motor Co. has suspended operations until Nov. 15, the placing of additional November orders for steel by both parts makers and motor car manufacturers themselves points to a gradual stepping up of the industry's production throughout next month. If this program is delayed it will be because of a general disposition to await changes in the Ford model before making definite plans for the future.

Steel ingot production has given further ground. The Steel Corporation's average is down to 80 per cent. The rate for the industry in the Chicago district is estimated at 85 per cent, while at Pittsburgh it does not exceed 80 per cent. The Youngstown average is 75 per cent and Wheeling district plants are running at 65 to 70 per cent of capacity.

Railroad equipment buying is the bright spot of the week. Orders for 11,600 freight cars raised the number placed since Oct. 1 to more than 18,000, requiring over 200,000 tons of steel, exclusive of the wheels and axles. New inquiries appeared for 6000 freight cars, as well as 45 locomotives.

The Pennsylvania will distribute orders for 310,000 tons of rails by the end of the week, and early action is expected on the New York Central's inquiry for 200,000 tons. The North Western and the Rock Island will also soon buy rails.

Rail purchases, as well as contracts for semi-finished steel, helped to account for the Steel Corporation's gain in unfilled tonnage in September. Specifications against these earlier orders are now being received and rail production at Chicago will be stepped up next week from 75 per cent to 80 per cent of capacity. The Ensley mill, which had been idle, resumed operations Monday.

Three light cruisers to be built in the Navy yards will require 22,000 tons of steel, on which bids will be opened early in November.

Pipe line inquiries from Cleveland and Detroit call for 10,000 to 15,000 tons of plates, and a 300-mile project for an oil company involves 20,000 tons of 4, 6 and 8-in. pipe.

Fabricated structural steel lettings for the week, at 23,000 tons, were light, but the unusually large total of pending work was augmented by new inquiries for 49,000 tons, of which 20,000 tons came out of the New York district.

Sheet mill operations have declined to 75 per cent of capacity or less, and strip mills are running at 50 to 60 per cent. Automobile body sheets are now generally quotable at 4c., Pittsburgh, or $2 a ton below the recent market. No. 13 blue annealed sheets have been sold to large buyers, in some instances, at 2.25c., Pittsburgh, also a reduction of $2 a ton. Such quotations, however, are usually made only by continuous mills, which have also sold No. 10 gage at as low as 2c., Pittsburgh, compared with a more common minimum of 2.10c.

Strip prices have been fairly steady, although occasional large tonnage sales of hot-rolled material have been made at 1.80c., a $2 a ton concession. Shapes and bars are more freely available at 1.90c., Pittsburgh, and plates, although still quoted at 1.95c., have not been exempt from shading.

Heavy melting scrap has declined 50c. a ton at Philadelphia and 25c. a ton at Chicago, but has developed strength at Pittsburgh, where a large steel company purchase took most of the surplus supplies out of the market.

Connellsville coke is firmer, following a sharp reduction in the output of furnace grade.

Pig iron buyers, particularly those near steel producing centers, have no incentive to hasten their purchases in view of the prospect of larger offerings of surplus tonnage from steel works blast furnaces. Reductions in foundry melt have been restricted mainly to the automobile industry. The Ford company, however, has bought 17,000 tons of basic iron and has placed additional orders for high-silicon malleable iron, bringing its total purchases of that grade in the past four weeks to 16,000 tons.

Fabricated structural steel lettings in September (computed) totaled 315,700 tons, compared with 365,750 tons in August. Bookings in the first nine months, at 2,952,950 tons, established a new record, exceeding the previous high mark of last year by nearly 16 per cent.

Both of THE IRON AGE composite prices are unchanged, finished steel at 2.369c. a lb., the lowest level so far this year, and pig iron at $18.29 a gross ton, which is 4c. a ton above the year's low.

Pittsburgh

Steel Plant Operations Curtailed Further—Shipments to Automobile Industry Smallest in 18 Months

PITTSBURGH, Oct. 15.—Pittsburgh and nearby steel companies, particularly makers of flat-rolled products, have curtailed operations further in the last week. With shipments to the automobile industry at the lowest point in about 18 months, steel makers are now chiefly concerned in gaging the duration of the present lull in buying from that quarter. The Chevrolet Motor Co. today suspended operations until Nov. 15, but the placing of November orders by parts makers and the automobile companies themselves indicate that production will be gradually stepped up next month. The automobile industry seems to be waiting for proposed changes in the Ford model before making any definite plans for the future.

Placing of rather large car orders with railroad equipment builders tributary to Pittsburgh mills has been the most favorable factor in this market during the past week. This business will contribute heavily to the backlogs of local plate mills and at least one nearby car builder now has sufficient work ahead of it to last well into the first quarter of next year.

Barge builders are also well occupied for the remainder of the year and structural fabricators and shape mills are fairly busy. Demand for bars has improved slightly, but is by no means good.

The local rail mill will soon be actively engaged on new orders. The pipe market is quiet, but has been improved by an inquiry from a large oil company for 300 miles of 4, 6 and 8-in. line pipe.

Large users of tin plate are beginning to allot their 1930 tonnage, but operations of independent makers have declined further since the first of the month. The average for the industry is held up by the comparatively high rate of operations of the leading maker.

Reduced demand from the automobile industry has forced down sheet operations to about 75 per cent of capacity, while strip makers are not more than 60 per cent engaged. In the face of such light demand, strip prices have held remarkably well and concessions are still rather exceptional on both hot and cold-rolled material. Demand for cold-finished steel bars is also very quiet, but the price is holding.

Sheet prices are weak, but mills are making determined efforts to hold the market at recently reduced levels. In the Pittsburgh district, wire and wire nail prices are gaining some stability, but shading is still common in adjacent territory.

Pig iron is quiet, but shipments are improving slightly. A local steel company is inquiring for a tonnage of basic. The scrap market has developed considerable strength following a large purchase by a nearby steel company, which took most of the surplus heavy melting steel out of the market. Coke is also stronger and production of the furnace grade has been reduced sharply in the Connellsville district.

Pig Iron.—With the exception of an inquiry for basic iron by the Edgewater Steel Co., Oakmont, Pa., the pig iron market is very quiet. Sales of carload lots are common, but large users who have not contracted for their last quarter requirements seem in no hurry to cover and are buying on a hand-to-mouth basis. Shipments from local and Valley furnaces are a trifle heavier than they were in September and yard stocks of leading producers have grown very little. Some sellers are fairly well covered for several weeks, but others are beginning to need orders. Steel company iron is not yet a factor in the market, at least not any more than it is under normal conditions, but the possibility of cheaper iron being available as steel company operations decline is certainly giving large users of basic no incentive to hurry their purchases. Prices are holding at $18.50, Valley, for basic and foundry iron and at $19 for malleable and Bessemer.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—This market is dull, as large users have quietly extended their third quarter contracts and very little spot tonnage is coming into the picture just now. Shipments are about the same as they were during the greater part of September, although the requirements of some consumers have been curtailed slightly this month. This is notably true in the case of strip makers, whose operations are very low. Mills have now fully replenished their normal reserve stocks of unfinished steel and, in the face of light demand from their finishing mills, are reducing operations from week to week. The price structure for the fourth quarter has been given little open market test, but it seems reasonably certain that small tonnages have moved at $35, Pittsburgh or Youngstown, for billets, slabs and sheets bars. Large customers enjoy preferentials in the usual way. There is some consumer opposition to this price, particularly from sheet makers who are selling their finished product at lower prices. Wire rods have settled to $40, Pittsburgh or Cleveland, and fourth quarter contracts of most users have been readjusted to this level. Further price weakness seems unlikely at this time, as makers of wire and nails are striving to maintain the market at present levels and a decline in raw material prices would have an unfavorable sentimental effect.

Bolts, Nuts and Rivets.—Demand has declined slightly this month, but bolt and nut makers are still operating at a good rate for this season of the year. The average for the industry is not less than 65 per cent of capacity. Better business is anticipated in view of the large car orders now being placed and the carriers are expected to be heavy consumers during the remainder of the year. Prices are unchanged at 70 per cent off list for bolts and nuts and $3.10 a 100 lb., base Pittsburgh, for large rivets. Rivets 7/16-in. and smaller are sold at 70 and 10 per cent off list.

Rails and Track Supplies.—The market is very active from the standpoint of work in prospect, but actual awards have not been numerous in the last week. The Louisville & Nashville has placed 62,000 tons of rails with the Southern mill, as well as 10,000 kegs of spikes with the same maker. The New York Central and the Pennsylvania have not yet announced the distribution of their rail orders and the Baltimore & Ohio has not brought out its inquiry. Specifications for track accessories are rather light at this time of the year, but are seasonably satisfactory. Light rails are quiet, with prices ranging from $34 on the rerolled product to $36 for the new billet material.

Bars, Shapes and Plates.—Business in the first half of October has shown no further decline from September and slight improvement is reported from some quarters. Pittsburgh district mills are not yet receiving specifications against recent car orders placed with builders in this area, although recent awards will benefit Pittsburgh shops. It is expected that the steel for 1500 of the 5000 freight cars placed by the Southern will come to a mill in this territory. Barge business is also showing improvement; a recent order for five steel barges placed with a local maker will take 750 tons. Considerable additional tonnage is in prospect from this source and the completion of the Ohio River canalization project, which will be celebrated this week, is expected to give renewed impetus to this work. Structural business is marking time, and, although few large projects are coming out in this vicinity, both mills and fabricators in this district are well occupied with work from more distant points. Demand for merchant bars is not active. Cold-finishing mills are operating at a reduced rate and other large consumers are only fairly well occupied. The reinforcing bar trade, which has been very busy all summer, is growing less active as cold weather approaches. Prices show no substantial change, with mills still quoting 1.95c., Pittsburgh, on plates, but with the market on bars and shapes ranging from 1.90c. to 1.95c. Large tonnages nearly always command the lower price. There is less question about the plate price, as demand is somewhat stronger and mills have less incentive to quote a lower figure.

Wire Products.—Following several weeks of instability, wire and wire nail prices appear to be gaining some strength at recent low levels. In Pittsburgh, the minimum on nails is $2.45 a keg, although concessions in outlying districts are reported occasionally. The wire price to jobbers is still somewhat unsettled, but the price to the manufacturing trade is holding at 2.40c., Pittsburgh. Demand is generally quiet, so far as jobbers are concerned, but there is a fair movement of manufacturers' wire. The lull in automotive buying has adversely affected business with some makers.

30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1¼% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	8.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Ferroalloys.—Shipments have declined slightly in the last month, but one or two companies have recently increased their requirements, following curtailment in August and September. Both buyers and sellers of ferromanganese are watching the tariff situation closely, but it is likely that next year's contracts will be made on the basis of present conditions, with revision in case the duty on manganese ore is removed. Contracting will begin in another month. Spiegeleisen is quiet and the market is lacking in inquiry.

Warehouse Business.—Sales out of warehouse have been rather slow in this district in the last few weeks, but prices have not reflected weakness in mill quotations, except in the case of sheets and wire nails. Black sheets are quoted at 3.80c. a lb. in lots of 25 or more bundles, while galvanized are at 4.45c. Wire nails are available at $2.80 a keg, and plain wire is off $2 a ton. Plates and structural shapes are holding at 3c., and reinforcing bars at 2.75c., in cut lengths.

Tubular Products. — Business in standard butt-weld pipe is reaching the end of its season, but mills are still fairly well occupied. This product has shown something of a decline from last year in aggregate tonnage, but makers who have followed the trend of small building work during the year have not been disappointed in the showing. Lap-weld operations continue fairly high, but are on a hand-to-mouth basis and few mills have any large backlog tonnages. Demand from the oil country is only fair, but seamless mills have had a fair year and see no prospect of any marked curtailment in demand. Pipe makers are watching the oil industry closely in an effort to discern the trend of conservation programs in prospect, but moves in this direction are not expected to have any immediate effect on steel pipe business. Mechanical tubing is quiet, but there is a fair demand for boiler tubes. The recent $4 a ton advance in seamless and lap-welded boiler tubes has been adopted by all makers.

Sheets. — Declining sheet demand which has been in evidence for several weeks is now beginning to be reflected fully in sheet mill operations, which are now not more than 75 per cent of capacity, with some companies considerably under that figure. The leading interest ran its mills last week at 79 per cent. After record September shipments the decline this month is rather marked, but there are already signs of improved demand for November rolling. By that time the large makers of automobiles are expected to have completed their model changes and, although improvement may be rather slow, production schedules are expected to be stepped up regularly. Prices are still rather unsettled. Black sheets have definitely declined to 2.75c., Pittsburgh, and mills are no longer making any effort to get more than 4c. for automobile body sheets. Higher quotations are encountered occasionally. Galvanized material is still quotable at 3.50c. to 3.60c., Pittsburgh, although the higher figure is applying on less business than it did a month ago. On blue annealed sheets, prices on the jobbing mill product are holding at 2.20c. and 2.35c., Pittsburgh, for the No. 10 and No. 13 gages, respectively, but the sizes made on the continuous strip or sheet mills are going at $4 a ton less. On the No. 10 gage strip, prices as low as 1.90c., Pittsburgh, have been encountered. Such a condition adds considerable confusion to a market which is already rather muddled, but the leading maker of blue annealed sheets by the jobbing and plate mill method still has four weeks' works on its books and is not meeting with any particular difficulty in maintaining the full quoted price.

Tin Plate.—Mill operations have declined during the last week, and, although the leading maker has reduced its rate very little, the average for independent mills is not above 60 per cent of capacity. However, orders for 1930 tonnage are beginning to come in and mill schedules will be stepped up during the next month as makers begin to work on this business.

Strip Steel.—Strip demand is anything but brisk, but reports of expected improvement are heard on all sides and it now seems certain that a better demand from the leading consuming industry can be relied upon by the middle of next month. The automobile makers are not placing orders for strip, nor are they releasing tonnage on old orders. As a result, the strip industry is not operating at better than 60 per cent of capacity. Prices are holding fairly well, although there have been some concessions. The principal weakness is in the wider sizes of hot-rolled, on which mills are quoting 1.90c., Pittsburgh. The narrower width are rather firm at 2c., and the market on cold-rolled is unchanged at 2.75c. to 2.85c., Pittsburgh or Cleveland.

Cold-Finished Steel Bars and Shafting.—This market is very quiet, although conditions have not changed materially since early September. With the automobile industry virtually out of the market, demand is confined to widely diversified lines which are not large tonnage users.

Coal and Coke.—The furnace coke market has a better tone, as most of the surplus material which forced prices down a few weeks ago has been disposed of, and production in the Connellsville region has been curtailed sharply. The H. C. Frick Coke Co. put out 1241 ovens in the region last week. Furnace coke is still quotable at $2.65 to $2.75, Connellsville, but the lower quotation is less common and will likely disappear in a short time. Demand for foundry coke is still quiet and prices are weak. Domestic fuel needs are improving consistently.

Old Material.—Following the sale of a large tonnage of No. 1 heavy melting steel to a nearby steel company at $17, the scrap market has a much stronger tone. This purchase took much surplus steel out of the market, and dealers are paying better prices to cover against this sale than they were a week ago. Other small sales to mills have also been made, bringing prices as high as $17.50. Compressed sheets are still rather quiet, and, in the continued absence of mill buying are hardly quotable as high as steel. Dealers have paid $16.75 and less for this material and the principal users are turning down offers to buy at $17 and $17.25. The light grades of scrap are quiet, but sales of specialties are being made regularly at $20.50 to $21. Steel foundry operations are good and shipments of this grade of scrap are keeping up.

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.00 to $17.50
No. 2 heavy melting steel	15.00 to 15.50
Scrap rails	16.00 to 16.50
Compressed sheet steel	16.75 to 17.25
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels	15.50 to 16.00
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.00 to 12.50
No. 2 railroad wrought	17.00 to 17.50
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.50 to 21.00
Railr. coil and leaf springs	20.50 to 21.00
Rolled steel wheels	20.50 to 21.00
Low phos. billet and bloom ends	21.50 to 22.00
Low phos., mill plates	21.50 to 22.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	19.00 to 20.00

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.

Upset hex. cap screws, S.A.E. thread	85
Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Railroad Needs Still Feature of Steel Market—Ingot Output Barely Sustained at 85 Per Cent

CHICAGO, Oct. 15.—The limelight in the Western iron and steel market is held by railroad needs of rails and equipment. The Santa Fe has closed for 5754 freight cars and 51 passenger type cars, requiring in all well over 85,000 tons of steel for superstructures alone. Fresh inquiry, issued by the St. Louis-San Francisco, is for 3800 freight cars and 15 baggage and mail cars. The Burlington states its locomotive requirements at 12 passenger type and eight for freight service.

Western railroads which placed rail orders early in the fall are issuing instructions for immediate shipment. Rail mills, which on old orders have sustained output at 75 per cent of capacity, will increase production to 80 per cent in the next week.

Railroads named as probable buyers during the next week or 10 days are the New York Central, the Pennsylvania, Rock Island, Chicago & North Western and the Illinois Central.

The plate, shape and bar market is scarcely altered from a week ago, except that deliveries on many sizes may now be had in a little more than a week. Price concessions of $1 a ton on bars and shapes appear not to have spread and, in this respect, the price structure for these commodities seems to be more stable.

Ingot output in the Chicago district still holds at 85 per cent of capacity. However, backlogs are not impressive, and some producers doubt that this rate can be sustained for long unless heavier buying and larger new releases soon come to their aid.

A blast furnace that has been held banked at Gary is again producing iron in the place of a furnace that has been blown out. This leaves only one banked stack.

Pig Iron.—Six merchant stacks now in blast in this district are producing a little more iron than is going forward on current shipments. The current melt is steady at the rate in effect at the end of September. Sales of Northern iron are confined to an active spot market and the closing of a few late fourth quarter contracts. Reports that the market in Michigan had dropped to $19, base furnace, are said to be without foundation, but it is well established that going prices there are $19.50 to $20 a ton, base furnace, with the higher quotation holding only on small lots. It is reported here that several Lake Erie interests have closed orders for 10,000 to 15,000 tons of basic iron for delivery at Detroit. An Illinois user of Southern iron has exercised an option for 10,000 tons and a Milwaukee user has closed for 2000 tons.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Sheets.—Demand continues to run lighter, and deliveries are slowly improving. Black and galvanized sheets may now be had in two to three weeks and the blue annealed commodity can be shipped in four weeks. The reduction in backlogs of blue annealed sheets is leading Chicago producers to enter the market for a share of going business. This is in contrast with their attitude six to eight weeks ago, when promises of delivery got so far ahead that they withdrew from the market. The price situation is little changed from a week ago. Competition in the territory served by the Ohio River has brought out galvanized sheets prices as low as 3.55c. a lb., Gary. Black sheets have recently been sold in Chicago at 3c. a lb. Consumers are not changing their policy of hand-to-mouth buying, and though local hot mill output still averages 85 to 90 per cent of capacity, it is becoming increasingly difficult to maintain this rate on the amount of business offered. Larger releases by steel shelving manufacturers are noted.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Ferroalloys.—This market is quiet and prices are unchanged. Several car lots of spiegeleisen have been placed at $34, Hazard, Pa.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Cast Iron Pipe.—The local cast iron pipe market seems to have touched the low spot of the year. Royal Oak, Mich., is said to have placed a sizable tonnage with an unnamed bidder, and Riverside, Ill., will buy 100 tons of 12 and 16-in. pipe. Some interest is being shown by private buyers, but the aggregate tonnage is not impressive. It is reported here that Rockford, Ill., has thrown out bids on a sewage disposal plant.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Rails and Track Supplies.—Transactions in these commodities in the week were confined to an order for 14,000 tons of track fastenings. Of special note, however, is the fact that rail mill output, now at 75 per cent of capacity, is to be stepped up to 80 per cent by the end of the coming week. Heavy purchases of standard-section rails are reported to be near at hand. Local sellers expect contracts to be placed next week by the New York Central and the Pennsylvania. The Rock Island, which took 50,000 tons a year ago, is expected in the market in the near future, and there is promise that the Illinois Central may soon buy rails, notwithstanding reports given out recently that this purchase would be made late in the year. Another purchase near at hand is that by the Chicago & North Western.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cold-Rolled Strip.—Releases continue light, and production is barely supported between 60 and 65 per cent of mill capacity. Prices are holding on small-lot sales.

Warehouse Business.—Chicago warehouses are announcing lower prices on common and cement coated wire nails. The new quotations are $2.95, base, per keg, this being a drop of 25c. a keg. Demand for steel commodities out of warehouses is fully equal to that in the previous week.

Reinforcing Bars.—This market is quiet both as to orders placed and fresh inquiries. Prices for billet steel reinforcing bars continue weak and mixed, occasional lots having been taken below 2.15c. a lb., Chicago warehouse. Though there have been many reports of efforts to stabilize prices, there is no evidence that measures taken thus far have been effective. Rail steel bars are quiet, with the asking price 2c. a lb. The Milwaukee Road, which estimates its track elevation needs in Chicago at 800 tons, has ordered about 150 tons in small lots. Bids on 50 tons for Illinois State buildings are to be opened Oct. 15.

Hot-Rolled Strip.—Buyers continue to take this commodity only as their immediate needs dictate. Bookings are unusually light for October. Prices are holding moderately well, though concessions are noted from the current quotations of 2.20c. a lb., Chicago, for 6 in. and narrower, and 2.10c. for strips wider than 6 in. Releases from automobile manufacturers are light, not only because of curtailment of output, but also because of efforts to reduce inventories. Output of hot-rolled strips ranges from 60 to 65 per cent of capacity.

Cold-Finished Steel Bars.—This market remains steady at 2.30c. a lb., Chicago. Contracting for fourth quarter has been in fair volume. Demand from automobile manufacturers is light, but specifications from makers of farm implements have helped to fill in cold-finished bar production schedules, and the industry is operating at close to 75 per cent of capacity.

Plates.—Orders for more than 85,000 tons of steel will come to Western

mills to cover car orders placed with Western shops. The Santa Fe has ordered 5754 freight cars and 51 passenger cars. The 5000 tons of steel needed for the Chicago & Eastern Illinois order will be booked locally. There is a possibility that some of the 5000 cars recently ordered by the Southern will be built in shops which draw on Chicago mills for their steel needs. New inquiry looms large as the St. Louis-San Francisco comes into the market for 2500 box, 800 gondola, 500 automobile, 10 baggage and five baggage and mail cars. The Great Northern, in announcing its budget for next year, discloses that it will build 1000 box cars at St. Cloud, Minn., 300 ore cars at Superior, Wis., and 30 locomotives at Great Falls and Hillyard, Mont. Also included in this program is the purchase of 1000 gondola cars. An oil refiner in the Southwest has ordered 3000 tons of plates, which will be fabricated into tanks by a local shop. Fresh tank inquiry is dull and outstanding projects now call for not more than 12,000 tons. The Milwaukee pipe maker has received an order for 11,000 tons of 20-in. pipe for the Southern California Edison Co. Deliveries of plates show marked improvement, with practically the full range in sizes to be had in 10 days to five weeks.

Old Material.—Heavy melting steel, shoveling steel and No. 2 wrought have declined 25c. a ton. Many specialties have declined, as the entire market seeks the lower level reached a week ago by heavy tonnage grades. A sale of 1000 tons of hydraulic bundles recorded a new low price of $13 a gross ton, delivered. Rerolling rails, which were strong a week ago on a direct purchase by a steel mill from a railroad, have receded again to the general level of the market. Short rails are also easier. Consumers' commitments in the last few weeks have given brokers sizable books, and it is quite evident that sellers are now taking more interest in covering old business than in accumulating orders for future deliveries. Steel foundries in this district have sizable books and are taking scrap freely. Use of scrap by malleable foundries is spotty, though there are some foundries in this class that are pressing for deliveries. Requirements of gray iron foundries are still in fair volume, but decidedly more spotty than a week ago. The break in prices paid by consumers is being followed by lower prices paid to the railroads. The Santa Fe is said to have received $17 a ton, delivered, for malleable and $13.25 for No. 1 wrought. The Chicago & Alton has sold 1000 tons of scrap and the Pere Marquette 3000 tons.

Prices deliv'd Chicago district consumers:

Per Gross Ton	
Basic Open-Hearth Grades:	
Heavy melting steel	$14.25 to $14.75
Shoveling steel	14.25 to 14.75
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraul. compressed sheets	12.50 to 13.00
Drop forge flashings	10.75 to 11.25
No. 1 busheling	12.75 to 13.25
Forg'd cast and r'l'd steel carwheels	18.50 to 19.00
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.25 to 14.75
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	12.00 to 12.50
Cast iron borings	10.00 to 10.50
Short shoveling turnings	10.00 to 10.50
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	16.75 to 17.25
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	19.50 to 20.00
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
Per Net Ton	
Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	20.50 to 21.00
Iron car axles	26.00 to 26.50
Steel car axles	17.00 to 17.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	12.75 to 13.25
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.75 to 11.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Bars.—Both new buying and specifications for mild steel bars compare favorably with shipments. Needs of farm implement manufacturers are heavier and enlarged schedules are in the making. It is reported here that heavier production of automobiles is planned for November. In the meantime, the only live spots in demand are in shops where new models are going into production. Backlogs in rail steel bars are shrinking. Specifications continue to match shipments, but new buying, both for nearby and future needs, has tapered rather sharply. Announcements of fall terms on fence posts are not yet productive of larger orders.

Structural Material—Building contracts continue to drag in the immediate Chicago territory, but in outlying districts prospects look brighter. A power plant in central Illinois has added 3800 tons to steel makers' books. Included in new work in sight are 3000 tons for a new hotel at Oklahoma City, Okla., 2000 tons for an addition to the Union Station, Omaha, Neb., and 4000 tons for the Northwestern Mutual Life Building, Milwaukee. A meeting which had been called for this week by the Chicago Board of Education has been postponed and it may be several weeks before a decision is reached as to the placing of a 3500-ton contract for a new junior high school.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Wire Products.—Nail demand is under 50 per cent of normal for this time of the year. Prices continue weak. Shipments of manufacturers' wire to other than automobile plants is in good volume. Jobbers report improvement in fall trade, but still hesitate to carry suitable stocks and are pressing mills for prompt deliveries of small orders. Output by wire mills still stands at 65 per cent of capacity, at which rate producers are able to build stocks.

Bolts, Nuts and Rivets.—This market is holding to the gains noted a week ago. Prices are steady on small-lot sales.

Coke.—All ovens in this district are lighted and shipments of by-product foundry coke are fully equal to production. Prices are firm at $8 a ton, local ovens.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.10c. to 2.35c.
Reinforc'g bars, rail steel	1.85c. to 2.00c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands (¼ in. in Nos. 10 and 12 gages)	3.20c.
Hoops (No. 14 gage and lighter)	3.75c.
Black sheets (No. 24)	4.05c.
Galv. sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.35c.
Spikes, ⅝ in. and larger	3.55c.
Track bolts	4.55c.
Rivets, structural	4.00c.
Rivets, boiler	4.00c.
	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, sq., tap. or blank	60
Hot-pressed nuts, hex., tap. or blank	60
No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	2.95
Cement c't'd nails, base per keg	2.95

Detroit Scrap Declines

DETROIT, Oct. 15.—A decline of 25c. a ton has occurred on most grades of old material in this district during the past week. No sales of importance are reported.

Automotive production is at the low point for the year, with indications that some new models will be in the foundry in November, with accompanying increase in melt.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$13.75 to $14.25
Borings and short turnings	8.25 to 8.75
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	11.75 to 12.25
Old No. 1 busheling	10.25 to 10.75
Sheet clippings	8.00 to 8.50
Flashings	12.25 to 12.75

Industrial & Combustion Engineering Corporation, 303 Protective Life Building, Birmingham, has been appointed district engineer for the Despatch Oven Co., Minneapolis, Minn. The district includes Alabama, Georgia, Mississippi and Tennessee.

New York

Line Pipe Inquiries Upward of 20,000 Tons—Structural Steel Market Active—Prices Weaker

NEW YORK, Oct. 15.—Pig iron buyers are not pressing to cover their forward requirements, but purchases for nearby needs, in many cases to supplement previous orders, are in fair volume. Sales for the week, at 10,000 tons, compare with a total of 9000 tons in the previous week. In the absence of a broad buying movement and pending the development of interest in first quarter iron, sellers find it necessary to search for business. It is not surprising that prices have become somewhat more flexible, with $17.50, base Buffalo, occasionally shaded on foundry iron. Less Southern iron is being sold, but it is understood that Alabama furnaces are prepared to compete actively for first quarter tonnage when it comes into the market. Melt in this territory is holding up well. In some instances, foundries are pressing for shipments, indicating that their stocks are low; in other cases, November specifications have already been received by furnaces. All in all, increases in melt by some consumers tend to offset decreases by others. The New York Air Brake Co. is in the market for 600 tons of malleable for its Watertown, N. Y., plant. It is reported that another moderate-sized consignment of Dutch iron will soon be shipped to Bridgeport, Conn. The cargo has already been sold. Dutch foundry is quoted at $22.75, duty paid port of entry, for No. 1X and lower grades. The Port Henry, N. Y., furnace, which has been out for relining, is scheduled to blow in today.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*But. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Finished Steel.—Most of the local steel sales offices report improved buying in the past week. While no spectacular gain in orders has occurred, the rise in some instances has been quite noticeable as compared with preceding weeks. Moreover, inquiries are better, especially for pipe. One inquiry calls for about 300 miles of 4, 6 and 8-in., totaling upward of 20,000 tons, and other scattered inquiries total several thousand tons. An Eastern contracting company is taking prices on 4000 tons of plates for a pipe line in Cleveland. Fresh structural inquiries in the New York district call for a total of 19,500 tons, on top of the 63,000 tons reported in the week before. New pending work includes 9400 tons for the Salmon Building, Fifth Avenue at Forty-second Street, and 6800 tons for new subway work, making a total of 23,800 tons for subways now pending. The Pennsylvania Railroad is in the market for 7500 tons for a viaduct and suburban stations in Philadelphia. Awards have been light in the past week, but the outlook for building construction in the next several months is reported by fabricators to be exceptionally good. In the nine months ended Sept. 30, the total for the New York district of structural steel work for buildings, and not including subways, bridges, etc., was 423,501 tons, according to the Structural Steel Board of Trade of New York, compared with 458,259 tons for all of 1928. New orders for railroad cars placed in the East include 2500 for the Baltimore & Ohio. The steel price structure shows increasing weakness, especially on the large tonnage projects. Structural shapes are obtainable by most buyers at 2.14½c., delivered, with some large users getting still lower prices. No. 13 gage blue annealed sheets are being sold to the larger buyers at 2.25c., Pittsburgh, by some mills, though others are holding for 2.35c., and the latter price applies in most instances on small orders. No. 10 gage blue annealed ranges from 2.10c. to 2.20c., but the material above 24-in. wide rolled on continuous mills is being sold frequently at as low as 2c., Pittsburgh. Hot-rolled strip steel has been sold at concessions of $2 a ton to large buyers. In the main, however, strip prices remain fairly steady. Buyers have attempted to obtain concessions on plates, but except for the large tonnages, on which concessions are usually obtainable, there appears to be no marked change in the price situation on this product.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.22½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Reinforcing Bars.—Bookings this month have been at a somewhat higher rate than in September. The Concrete Steel Co. has taken three jobs nearby which will require a total of 400 tons of bars. A third subway section is now out for bids, making about 1000 tons of bars which will be awarded shortly for New York subway work. Although new billet bars are generally priced at 2.05c., Pittsburgh, a few contracts are reported to have been made at $4 to $6 a ton under that figure.

Billet steel reinforcing bars in 40, 50 and 60 ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Cast Iron Pipe.—Buying of pressure pipe is limited to small tonnages and prices are generally unchanged. Hartford, Conn., has awarded about 350 tons of centrifugal pipe to one Southern maker and about 20 tons of fittings to another. Newburgh, N. Y., has placed 125 tons of water pipe with the Warren Foundry & Pipe Co., the low bid having been $36.45 a net ton, delivered. Inquiry for pipe from private companies continues small and is not expected to show much im-

provement until buying for spring delivery begins late in the fall.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe, $3 extra.

Warehouse Business.—Buying from stock has been fairly active this month. Demand for structural material, steel bars and black sheets is active, but galvanized sheets have been quiet in the past week or more, and prices continue weak. Concessions of $2 and more a ton are not uncommon.

Coke.—Furnace coke is firmer, the standard furnace grade being quoted at about $2.75 a net ton, Connellsville, Beehive foundry coke is unchanged at $4.85 a net ton, ovens, for special brands, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. In the by-product coke field, foundry coke production will shortly be increased by the addition of this grade to the Koppers operation at Swedeland, Pa. In the past, these ovens have produced only furnace and sized coke. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Although consumers in eastern Pennsylvania are either temporarily out of the market or offering to buy scrap only at reductions from recent purchase prices, brokers' buying prices are generally unchanged. No. 1 heavy melting steel is being shipped on contracts to Coatesville, Pa., and Bethlehem, Pa., brokers paying $15.50 a ton, delivered. The mill at Claymont, Del., has not been accepting shipments in the past week. No. 2 heavy melting steel prices have receded slightly and are now $13 to $13.50 a ton, delivered, and a sufficient supply is reported to be available at these prices.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.00 to	$12.85
Heavy melting steel (yard)	8.00 to	9.50
No. 1 hvy. breakable cast.	10.25 to	11.00
Stove plate (steel works).	8.00 to	8.25
Locomotive grate bars....	8.25 to	8.75
Machine shop turnings....	7.50 to	8.00
Short shoveling turnings..	7.50 to	8.00
Cast borings (blast furn. or steel works).....	7.00 to	7.75
Mixed borings and turnings	6.75 to	7.75
Steel car axles	18.50 to	19.50
Iron car axles.....	23.00 to	24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)		10.25
Forge fire	9.50 to	10.00
No. 1 railroad wrought...	12.00 to	12.50
No. 1 yard wrought, long..	11.00 to	11.50
Rails for rolling.....	12.75 to	13.25
Stove plate (foundry)....	8.00 to	8.50
Malleable cast (railroad).	13.50 to	14.00
Cast borings (chemical)..	9.50 to	10.00

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$16.00 to	$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	14.00 to	14.50
No. 2 cast (radiators, cast boilers, etc.).....	13.50 to	14.00

Cleveland

Steel Demands Light and Prices Weaken—No Important Gain in Automobile Industry Expected This Year

CLEVELAND, Oct. 15.—Demand for all lines of finished steel continues light. The steel industry has been counting on a revival of automobile manufacturing this month, but a pickup of any proportions is not in sight, and the general opinion is that automobile production will remain rather slow the remainder of the year.

With further retrenchment by some of the car builders to change over to their new models, the production of automobiles is still declining. However, a few of the automobile manufacturers have placed orders for round lots of sheets for November delivery and some increase is looked for in the output of motor cars late in November.

Sheet mills have cleaned up on shipments of material for Chevrolet bodies, and during the week received releases of good tonnages of sheets for bodies for this company's new cars. Shipments of this material are to start Nov. 4. Automobile parts makers as yet have received few orders for parts for new cars.

Steel production has been further curtailed. The leading local producer of steel bars is now operating at about 75 per cent of capacity and some of the sheet and hot and cold-rolled strip mills are down to about 50 per cent.

While there are still price irregularities, the market shows little change in this respect from a week ago. The steel bar price situation appears to have been clarified by the adoption of a 1.90c., Cleveland, base by local mills. Some weakness has developed in plates.

Pig Iron.—The Ford Motor Co. on Saturday purchased 17,000 tons of basic pig iron for October shipment. While the source of the iron was not announced, it is understood that it will be shipped by water and presumably will come from a Lake furnace. Additional purchases of high silicon foundry iron have been made by the Ford company, making the reported total of 16,000 tons over the past three of four weeks. This company is not yet through buying iron for this year's delivery, but probably will conclude its purchases in time to have the iron shipped by water before the close of the season of Lake navigation. The market was dull the past week, sales by Cleveland interests amounting to 13,600 tons, as compared with over 32,000 tons during the previous week. There is little buying by foundries in the automotive field as these feel the effects of the slackening of the automotive industry. Shipments to automotive foundries are spotty. Consumers in other fields are taking a fair amount of iron and some producers expect to ship a little more this month than in September. Cleveland quotations are unchanged at $18.50, furnace, for outside shipment and $19 for local delivery. While $20, base, is still the ruling quotation in Michigan, this price has been shaded to $19.50, or 50c. has been cut off the silicon extra on some business in central and western Michigan to meet a $19.50 price that is being quoted from Chicago and attributed to sellers of boat iron.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25		$19.50
S'th'n fdy., 1.75 to 2.25...	$19.50 to	20.00
Malleable		19.50
Ohio silvery, 8 per cent...		28.00
Basic Valley furnace.....		18.50
Stand. low phos., Valley..	26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces: $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—There has been a fair amount of late season buying of Lake Superior ore recently for fill-in purposes in lots up to 50,000 tons. Buying is thought to be about over for the season. Shipments show a moderate decline from September.

Semi-Finished Steel.—Specifications for sheet bars gained slightly during the week due to releases from two or three mills that have picked up some new sheet orders from the automotive industry. Shipments are being made against $35 contracts. Wire rods are firm at $40, Cleveland.

Strip Steel.—Demand continues light, both for hot and cold-rolled strip. Some of the hot rolling mills are not operating at more than 60 per cent of capacity and cold-rolling mills are even less favorably situated. Consumers are ordering from hand-to-mouth and not much gain in volume is looked for until the automotive industry picks up. Hot-rolled strip, while untested on round lot business, appears to be holding to the regular quotations of 1.90c., Pittsburgh, for wide and 2c. for narrow strip. Mills are maintaining the 2.75c., Cleveland, price for cold-rolled strip and some are still trying to get 2.85c. for small lots.

Bars, Plates and Shapes.—Demand for steel bars continues light, as mills are not getting much tonnage from the automotive industry. Structural

*Net base, including boxing and cutting to length.

material and plates are in fair demand from manufacturing industries. The building field is very quiet. The Cleveland Water Works Department has taken bids for extensions requiring 4000 tons of plates, and Detroit will ask for bids shortly for five miles of pipe, half 54 in. and half 66 in. of ½-in. plate. The Consumers Power Co., Jackson, Mich., has placed with two mills orders for 1700 tons of sheet steel piling for permanent use in dam work. The Cleveland mill price on steel bars has settled to 1.90c., mill. Pittsburgh district mills are trying to hold to 1.95c., Cleveland, for steel bars for delivery in this territory. Plates have been shaded to 1.90c., Pittsburgh. On shapes, 1.95c., Pittsburgh, is the ruling quotation.

Sheets.—Orders for good-sized lots of sheets have been placed by at least three automobile companies and with this business several mills have considerable more tonnage on their books than at the first of the month. There is fair demand from other sources, including refrigerator, stove and metal furniture manufacturers. No further price weakness has developed. Black sheets are holding at 2.75c., Pittsburgh, and galvanized at 3.50c. Continuous mills are quoting blue annealed sheets at 2.10c. for No. 10 and at 2.25c. for No. 13, and these prices have been shaded $2 a ton for attractive orders in the Detroit territory. However, jobbing mills seem to be holding to regular quotations on blue annealed sheets.

Wire Products.—Demand is dull and prices are still weak, particularly where there is competition from Ohio River and Indiana mills. The ruling quotations are $2.45 a keg for nails and 2.40c. a lb. for wire. Jobbers have sharply reduced prices for shipment out of stock to meet this situation.

Warehouse Business.—The volume is rather light, showing no improvement over last month. Orders are fair in number but are mostly for small lots. There is a good seasonal demand for galvanized sheets. Prices are firm.

Cold-Finished Steel Bars.—Specifications are very light for material used in the automotive industry, but orders from other consumers show some gain. The market is firm.

Coke.—By-product coke for domestic use is moving well and some of the producers have their entire output sold for this month. Prices are unchanged at $4.75, Ohio ovens, for egg and $4.50 for nut size, but producers are talking of an advance Nov. 1. Foundry coke is quiet. Ohio by-product foundry coke is quoted at $8.25 ovens.

Old Material.—The market is weak and very dull. No new demand has come from the mills and dealers are not buying much scrap to fill old orders. Heavy melting steel in lighter grades has declined 25c. a ton and blast furnace scrap has similarly declined, losing a portion of its recent gain. The slowing down in the automotive industry is reflected in a sharp reduction in the amount of scrap coming out of the Detroit territory.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.75 to $15.00
No. 2 heavy melting steel	14.25 to 14.50
Compressed sheet steel	14.75 to 15.25
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.50
Short shoveling turnings	11.50 to 12.00

Rails for rolling	16.25 to 16.50

Philadelphia

Demand for Shapes Improves with Prices Still Unstable—Pennsylvania Rails To Be Allocated This Week

PHILADELPHIA, Oct. 15.—Steel business continues irregular, products such as bars and sheets, which enter into automotive manufacture, being decidedly inactive, while plates and shapes are in moderate demand. Plate orders are limited to small tonnages, but shape mills have had a slight increase in the volume of orders since the beginning of this month. Despite this improvement, shape prices are lacking in firmness and cover a rather wide range.

The Pennsylvania Railroad is expected to allocate its 310,000 tons of rails for next year by the end of this week, and will open bids tomorrow on about 14,000 tons of structural steel for the West Philadelphia terminal viaducts and suburban station. The terminal building itself, which is not yet being inquired for, will require an additional 14,000 tons of steel.

Pig Iron.—Foundry iron is still quoted by eastern Pennsylvania furnaces at $21, base furnace, but with shipments of iron slightly in excess of new contracts an increased willingness has been evident to shade this price by 50c. a ton or more. Competition is still encountered from Southern sellers of pig iron, but the minimum quotation of Birmingham furnaces today is about $13.50, furnace, and certain sellers are maintaining $14 a ton, base. On 100 tons of low phosphorus iron, bids on which were recently opened by the Panama Canal Commission, Washington, the Bethlehem Steel Co. was low bidder and the Delaware River Steel Co. next. No other furnaces quoted on the business. The Virginia furnace will not be ready to go into blast until about the end of this month. Present plans are to offer both sand and machine cast pig iron and compete with the Birmingham producers in the sand cast grade. Consumers of basic in this district are not expected to buy before Nov. 1.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. IX	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Business is limited to small orders, in most cases at the new level of 1.90c. a lb., Pittsburgh, or 2.22c., delivered Philadelphia. Contracts for bars are being generally revised to the new basis, which is apparently firm in this district.

Reinforcing Bars.—Some substantial tonnages of bars are being placed with distributers and both billet steel and rail steel grades are being furnished. Billet steel bars are quoted at 1.95c. to 2.05c., Pittsburgh, or 2.27c. to 2.37c., delivered Philadelphia, usually with no extra for cutting to length. Rail steel bars range from 1.90c. to 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.22c. to 2.27c., delivered Philadelphia, with no extra for cutting to length. Occasionally the rail steel bar quotation is shaded by $1 a ton or more to secure desirable contracts. Pending projects in this district are 500 tons of bars for a sewer and bulkhead on Spring Gar-

den Street, Philadelphia, and 140 tons in a freight warehouse for the Pennsylvania Railroad at Harrisburg.

Plates.—Orders and specifications against contracts are in fair volume, but tonnages are small. Consumers of plates in this district are well engaged, especially boiler shops, most of which have sufficient business to carry them into next year. The price is being maintained at 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Shapes.—Fabricating shops are well occupied, in some cases having enough tonnage for the rest of the year. New fabricated projects are plentiful and shape mills have been booking a slightly increased volume of business this month. Prices, however, are still unstable, ranging from 1.90c., f.o.b. nearest mill to consumer, or 1.96c., delivered Philadelphia, to 2c., f.o.b. mill, or 2.06c., delivered Philadelphia. Occasionally less than 1.90c., f.o.b. mill, is quoted on desirable business.

Sheets.—Black and galvanized sheet prices are lacking in firmness and recent business, although for only moderate-sized tonnages, has been at 2.75c., Pittsburgh, or 3.07c., delivered Philadelphia, for black and 3.50c., Pittsburgh, or 3.82c., delivered Philadelphia, for galvanized. Blue annealed sheets are also inactive, but the prices are unchanged at 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage and 2.20c., Pittsburgh, or 2.52c., Philadelphia, for No. 10 gage blue annealed plates. To preferred buyers, or when competition is encountered from sheets made on the continuous mill, concessions of $2 a ton and more to 2.25c. for No. 13 gage, and 2.10c. for No. 10 gage, are usually made. Automobile body builders are still inactive, while awaiting the specifications on the new models of two prominent makers, with whom they have contracts. Meanwhile, commercial body builders have been increasing their output slightly. Radio manufacturers are becoming less active, as the end of their season of heaviest manufacture approaches.

Imports.—In the week ended Oct. 11, arrivals at this port consisted of 20 tons of structural shapes from Germany and 9 tons of steel rods from Sweden.

Old Material.—A large eastern Pennsylvania consumer of scrap has bought a sizable tonnage of No. 1 heavy melting steel at $15.50 a ton, delivered eastern Pennsylvania. Specification pipe is off 50c. a ton, on the basis of a purchase by a Lebanon, Pa., mill at $14.50 a ton, delivered, and No. 1 heavy melting steel is quotable at $15.50 to $16 a ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$15.50 to $16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50 to 14.25
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	14.50 to 14.75
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.50
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Eastern Mills Oppose Rail-Water Rates

Say Proposed Combinations in Examiner's Report Are Most Favorable to Pittsburgh and Chicago

WASHINGTON, Oct. 15. — Eastern steel manufacturers, through the Bethlehem Steel Co., have filed exceptions with the Interstate Commerce Commission against the examiner's report in the so-called Consolidated Southwestern cases as it would affect iron and steel rates from interior trunk line points to interior Southwestern points, a suggested basis for which was incorporated in the Bethlehem brief.

The contention was made that the proposed rates would subject Eastern mills to excessive and prejudicial rates in exacting the full combination of the locals to interior Southwestern points while according to Pittsburgh and other competing origins through rates less than their combinations. The Eastern steel shipper, it was stated, is vitally interested in securing rates to the Southwest by way of the ocean routes which are no higher than is reasonable and nonprejudicial as compared with rates from competing origins.

The following table was cited to show the rates in cents per 100 lb. on structural steel to Dallas that would result if the report is approved:

From	Rail-Water Rail Combination	Effective Rate if Proposed Report is Approved	Difference
Pittsburgh	100.5	93	7.5
Chicago	93	71	22
Steelton	84	84	0
Bethlehem	84.5	84.5	0
Baltimore	75.5	75.5	0

It was pointed out that Pittsburgh would be brought within 15.5c. of Baltimore, while the present local rate is 31c., and would be brought within 8.5c. of Bethlehem, while the present difference in their rates to Philadelphia is 19c., and under the adjustment prescribed in the Eastern general steel rate case it will be 17c. Bethlehem, Steelton, Baltimore and all similar Eastern points, it was declared, will pay their full combinations, while Pittsburgh and Chicago will pay 7 per cent and 23 per cent less than their respective combinations.

Rates suggested for iron and steel articles to Dallas were: From Pittsburgh, 90c.; from Steelton, 76c.; from Bethlehem, 73c., and from Baltimore, 70c. It was declared that the suggested basis would treat all shippers and destinations alike as to the water factor in their through rates. The rates proposed on iron and steel articles generally are: From Pittsburgh, 93c.; from Steelton, 86c.; from Bethlehem, 82.5c. and from Baltimore, 75.5c. The per cent of combinations under the suggested basis would be 90 for Pittsburgh; 88.4 for Steelton; 88.4 for Bethlehem and 92.7 per cent for Baltimore.

Youngstown Mills at 75 Per Cent

YOUNGSTOWN, Oct. 15.—Steel makers in this district believe that the low point in the current automobile demand has been passed and that improvement will be registered from now on. Independent steel companies are averaging 75 per cent operation. The number of active sheet mills shows a moderate increase this week.

Ford to Have Record Size 1350-Lb. Boilers

The Ford Motor Co., Detroit, has bought of the Combustion Engineering Corporation, New York, for the Fordson plant two steam generating units, designed for 1350 lb. steam pressure superheated to 750 deg. Fahr. Each unit will have a maximum capacity of 700,000 lb. of steam an hour, a capacity believed to be the highest yet built for pressures as high as 1350 lb.

The boiler units will be fired by pulverized coal, the fuel entering the furnaces tangentially at the corners to give a turbulent mixing action of fuel and air for combustion. The furnaces will be of the all metal, water-cooled type and air preheaters will be installed to use the heat of the exit gases for preheating the air used for combustion.

Newton Steel Earnings $472,770 in Third Quarter

Net profits of the Newton Steel Co. for the third quarter totaled $472,770, after all charges, comparing with net of $799,923 for the second quarter and $719,692 for the first quarter. The company's statement shows a deduction of $64,468 for the quarter for Federal income taxes.

H. D. Conkey & Co., Mendota, Ill., manufacturer of overhead traveling crane equipment, has appointed the Cleveland Tool & Supply Co. as its agent in the Cleveland district.

Pacific Coast

Long Beach, Cal., Places 4285 Tons of Cast Iron Pipe—Los Angeles Building Takes 3000 Tons of Steel

SAN FRANCISCO, Oct. 12 (*By Air Mail*).—The United States Pipe & Foundry Co. booked 4285 tons of cast iron pipe for Long Beach, Cal. The McClintic-Marshall Co. was awarded 3000 tons of structural steel for a Los Angeles office building. These were the outstanding awards of the week.

Prices on steel products are holding fairly well, weakness in plates being the only marked divergence from levels which have been in effect for some time.

Pig Iron.—The pig iron market is without feature. Melters are taking only small tonnages.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Pending business in reinforcing steel is not large. The week's awards included 175 tons for a court house at Olympia, Wash., 200 tons for a market building in Seattle and 100 tons for an office building in Bellingham, Wash. Bids were opened this week on 363 tons for the approach to the West Spokane Street bridge, Seattle. Bids will be opened on Nov. 19 on 233 tons for the Lake Union bridge near Seattle. Out-of-stock prices in San Francisco remain at 2.30c., base, on carload quantities and at 2.60c. for smaller lots. In the Los Angeles district, quotations are $2 a ton higher.

Plates.—The recent order of the Pacific Gas & Electric Co. for 55,000 tons of fabricated steel pipe, which was awarded to the A. O. Smith Corporation, Milwaukee, as stated in the Oct. 3 issue of THE IRON AGE, was for 40 miles of 12-in., 80 miles of 16-in., 80 miles of 20-in. and 159 miles of 22-in. for a line to run from Kettleman Hills and the San Francisco district. Plate fabricators on the Pacific Coast bid on this business. Another order which went to the A. O. Smith Corporation, as also stated in the Oct. 3 issue, was for 11,000 tons of 20-in. welded pipe for the Southern California Edison Co., which will build a line from Kettleman Hills to Elk Hills. Bids will be opened on Oct. 24 on 1400 tons of 36 to 48-in. welded steel pipe for Everett, Wash. On orders for lots of ordinary size, the usual quotation is 2.35c., c.i.f., but on especially desirable business prices as low as 2.25c. have been made.

Shapes.—Structural steel shape lettings were heavier than usual this week and included a number of fair-sized projects. The McClintic-Marshall Co. took 3000 tons for an office building on Broadway, Los Angeles, the Consolidated Steel Corporation; secured 1500 tons for the Los Angeles Stock Exchange Building, and the United States Steel Products Co. booked 450 tons and 250 tons respectively for canning plants at Cagayana, P. I., and Cape Haitien, Tahiti, for the California Packing Corporation, San Francisco. New inquiries include 1000 tons for an auditorium at Long Beach, 400 tons for a power house at North Bend, Ore., and 276 tons for a bridge at California Park, Cal. Plain material continues firm at 2.35c., c.i.f.

Cast Iron Pipe.—Cast iron pipe lettings included 4285 tons of 6 to 12-in. Class 150 pipe for Long Beach, Cal., placed with the United States Pipe & Foundry Co., and 353 tons of 2 to 6-in. Class B pipe for Long Beach Boulevard, Compton, Cal., secured by Gadza & Gogo, Los Angeles. Azusa, Cal., placed 110 tons of 4 and 6-in. Class B pipe for Coney Avenue with J. J. Showalter, Los Angeles. C. E. Printiss, San Jose, took 138 tons of 4-in. Class 150 pipe for Pleasanton, Cal. No new inquiries of importance came up for figures during the week.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, 3/16-in. and over	3.15c.
Small angles, under 3/16-in.	3.55c.
Small channels and tees, 3/4-in. to 2 3/4-in.	3.75c.
Spring steel, 1/4-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, 1/2-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Inquiries for First Quarter Appear—Ensley Rail Mill Resumes Operations

BIRMINGHAM, Oct. 15.—Inquiries for pig iron for first quarter requirements are beginning to come in from Eastern and Middle West points. Several round tonnages have been sold recently in competitive territories, but they have been for the last quarter requirements. Stocks at furnaces continue to be reduced by the heavy shipments to other territories. District prices remain on the basis of $14.50 for No. 2 foundry. Prices on iron to outside districts are stronger. The No. 1 furnace of the Republic Iron & Steel Co. was blown in Oct. 14 on foundry iron, making a total of 15 active furnaces in the district. Of this number, seven are on foundry iron, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Demand is undiminished. The rate of new business compares favorably with that of last month. There is no noticeable change in the steady rate of specifying on contracts. Operations were resumed at the Tennessee company's rail mill at Ensley Oct. 14, following receipt of large rail orders, including 62,000 tons for the Louisville & Nashville. Prices on galvanized sheets have been increased $1 a ton to 3.75c. All other prices are unchanged. Structural steel fabricators have not booked any large orders, but small tonnages have been numerous enough to equal current output. Reinforcing bar manufacturers report better business, mostly in small orders. Eighteen open-hearths remain active, the same as last week.

Cast Iron Pipe.—The rate of buying has declined gradually during the past few weeks, and it is now at the low point of the year. Incoming business is less than the output at the plants, and backlogs are thin. Recent bookings have been made up almost entirely of small lots. A project at Dallas, Tex., estimated to require between 12,000 and 15,000 tons of the larger sizes of pipe, will be up for figures the end of this month. Bids are expected to be asked for in the near future on a project at St. Petersburg, Fla., to require about 1000 tons. These are the only projects of importance known to be pending. Quotations continue at $37 to $38 a net ton, Birmingham.

Coke.—Spot delivery for foundry coke is a little stronger. Shipments on contracts continue steady. Quotations have been at $5 a net ton, Birmingham, for almost two years.

Old Material.—Demand for steel grades is growing a little stronger as prospects for an increase in the melt become more certain. Iron scrap remains inactive. Prices are unchanged. In steel lines they show strength and in others they are soft.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Murray Iron Works Co., Burlington, Iowa, has appointed the following sales agents: Isaac Hardeman, Charlotte, N. C.; C. Keiser & Co., Dayton, Ohio; William Rudolph, Los Angeles, Cal.; and P. Schmertz, Detroit.

St. Louis

First Pig Iron Sale for First Quarter Is Made—Coke Demand Heavier—Scrap Still Weak

ST. LOUIS, Oct. 15.—The first sale of pig iron for delivery during the first quarter of 1930 was made by the St. Louis Gas & Coke Corporation—500 tons of foundry iron to an Illinois wheel manufacturer at present prices. Other inquiries for first quarter are pending. Otherwise, it was an uninteresting week, the local maker selling only an additional 2000 tons for shipment during the remainder of the year, including 500 tons each to an Iowa implement manufacturer and to a local jobbing foundry; 600 tons to a machinery manufacturer and 300 tons to a Missouri jobbing foundry. Sales of Southern iron were light as a result of heavy bookings several weeks ago. The market is firm on both Northern and Southern makes. Shipments of the local maker have averaged 1118 tons daily since Oct. 1.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—With other lines quiet, interest is centered in buying of rails. The St. Louis-San Francisco Railway, as noted, has tentatively placed 30,000 tons for 1930 with the Tennessee Coal, Iron & Railroad Co. It is understood that other railroads are working on their budgets, which will be approved probably about Nov. 1, and the impression is that purchases will be equal to last year's. There is little doing in plates, shapes and bars. The structural trade is dull, and fabricators are in need of orders.

Coke.—A steady increase in the demand for coke is noticed. Domestic coke buying exceeds the by-product output in the district, and the increasing melt is helping the sale of foundry grades. Demand for furnace coke by smelters is heavy, one factor increasing its schedules for October from 1000 tons to 1500 tons.

Old Material.—While prices of old material are unchanged, the market still is weak. There was some buying of rolling mill grades during the week and one consumer bought a small tonnage of steel grades. While the movement of scrap iron from the country districts has been cut down as the result of lower prices, railroad lists are heavy, including the following: Chesapeake & Ohio, 8981 tons; Louisville & Nashville, 8000 tons; Atchison, Topeka & Santa Fe, 6235 tons; Southern Pacific, 3450 tons; Texas & Pacific, 3120 tons; Terminal Railway Association (St. Louis), 2350 tons; International-Great Northern, 1500 tons; Chicago & Alton, 1230 tons; Chicago, Rock Island & Pacific, 180 carloads; St. Louis-San Francisco, 71 carloads; Nickel Plate, 41 carloads; Chicago & Eastern Illinois, 18 carloads; Nashville, Chattanooga & St. Louis, 14 carloads; Pullman Co. (St. Louis), 11 carloads, and Chicago, Milwaukee, St. Paul & Pacific, 9 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.50 to $14.00
No. 2 heavy melting or shoveling steel	13.00 to 13.50
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	15.50 to 16.00
Railroad springs	17.75 to 18.25
Bundled sheets	10.00 to 10.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	16.00 to 16.50
Machine shop turnings	7.50 to 8.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	12.25 to 12.75
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Boston

Pig Iron Sales Less Than 5000 Tons—Scrap Market Dull and Prices Decline Further

BOSTON, Oct. 15.—The Universal Winding Co., Providence, R. I., has bought 600 tons of Buffalo pig iron, silicon 2.50 to 3 per cent, and 400 tons of New York State No. 2X iron. A Massachusetts pump manufacturer bought 450 tons of Buffalo iron and some imported iron, while the Mystic Iron Works disposed of one 500-ton lot and another of 300 tons. Otherwise, business was confined to comparatively small tonnages, the aggregate of all sales falling under 5000 tons. There are no inquiries of importance in the market. Foundries that have not purchased fourth quarter iron apparently are in no hurry to do so. While Buffalo furnaces are maintaining $18 a ton, base furnace, on rail-and-water shipment iron, that price can be bettered on all-rail business, and some furnaces have been disregarding silicon differentials. The Mystic Iron Works sales the past week were at prices ranging from $20 to $20.75 a ton, furnace.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Cast Iron Pipe.—Ayer, Mass., has awarded 125 tons of 6 and 8-in. pipe to the Warren Foundry & Pipe Co., and Foxboro, Mass., 100 tons of 6-in. to the McWane Cast Iron Pipe Co. No other municipal business has been placed openly, but no less than a dozen towns and cities have placed orders for lots of a carload or more. Prices on domestic pipe are well maintained, especially on small dimensions. Quotations made openly are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16-in. and larger, $39.10 to $40.10. Business for next spring delivery is shaping up well. Already the following municipalities have announced plans for work then: North Attleboro, Mass.; North Kingston, R. I.; Westwood, Mass.; Dighton, Mass.; Brownville, Me.; Lenox, Mass.; Sudbury, Mass. The Worcester Gas Light Co., Worcester, Mass., has bought a round tonnage of steel pipe and is in the market for additional tonnages.

Reinforcing Bars.—The largest individual sale of billet steel bars the past week was 215 tons for a local bank building. Competition for this tonnage was keen. Mill representatives are quoting 2.66½c. a lb., base, from local stock, but that price has been shaded. The market for rail steel bars continues quiet at 2.26½c. a lb., base, delivered common Boston freight rate points.

Coke.—New England by-product coke ovens are devoting most of their attention to domestic fuel, demand

for which has been large the past week owing to a cold snap. Shipments of foundry coke on contract are steady, and the price remains at $11 a ton, delivered within a $3.10 freight rate zone.

Old Material.—Prices of old material continue on the downgrade. The weakness is ascribed to the softness of prices in the Pittsburgh territory and to the lack of buying by steel mills rather than to any pressure to sell. In fact, brokers say it is difficult to pick up more than an occasional carload of scrap at going prices and that owners of material in general are prepared to hold on until market conditions improve. Business in heavy melting steel the past week was practically nil. A small tonnage of steel turnings, mixed borings and turnings, steel mill borings, skeleton and forge scrap changed hands. There is virtually no market for T, girder and rerolling rails, shafting, axles, forge flashings and wrought. Consumers of chemical borings are holding up shipments.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$10.50 to $10.75
Scrap T rails	10.50 to 10.75
Scrap girder rails	9.50 to 10.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	9.00 to 9.50
Forge flashings	9.50 to 10.00
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.50 to 9.00
Shafting	13.50 to 14.00
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.25 to 9.50
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.50 to 9.75

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Cincinnati

Pig Iron Melters Slow in Covering Future Needs—Southern Prices Firmer—Scrap Market Weak

CINCINNATI, Oct. 15.—District consumers of pig iron continue to display reluctance toward entering the market for substantial tonnages, although reports indicate a fairly heavy melt and a sustained demand for castings. As a result, sales of pig iron last week declined sharply, furnaces reporting a total of approximately 3550 tons, of which 1550 was Southern foundry iron and the remainder Northern iron. While the Southern iron sold last week was in small quantities, generally carload lots, and no real test of prices resulted, furnaces maintained quotations at $14 to $14.50, base Birmingham. With surplus stocks of Southern furnaces substantially reduced, the market appears to be strengthening, and prices under $14, even on good tonnages, are less likely. Northern furnaces are adhering to present schedules, and current sales all figure at about $18.50, base, Lake furnace. The largest order of the week was from a central Indiana consumer, which took 400 tons of Northern Foundry iron. The Wickham Piano Plate Co., Springfield, Ohio, is asking for quotations, but no amount of iron is specified. The Favorite Stove Co., Piqua, Ohio, is inquiring for 400 tons of iron with 2.75 to 3.25 per cent of silicon.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89	to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19	to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69	to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19	to 18.19
S'th'n Ohio silvery, 8 per cent	26.89	

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Although new business of district sheet mills last week was approximately 25 per cent below capacity production, backlogs were increased slightly because a good portion of the new specifications was for forward delivery. Accordingly, the anticipated improvement in operating schedules did not materialize, but production at about 75 to 80 per cent is well sustained. Operators continue sanguine that schedules will be increased to full capacity by the first of next month, basing their opinions on the present volume of inquiry and the moderate improvement in the automotive demand. Seven to 10 days is about the average time for shipment of stock material, while three to five weeks is the general promise on special sheets. While prospects are still fairly good in the structural market, the current volume of business of district steel fabricators is small and competition is keen.

Coke.—Domestic coke is moving steadily, district oven representatives reporting about 3000 tons in miscellaneous lots as last week's total. By-product foundry coke is going forward at a good rate on contract, but new business is in small quantities.

Old Material.—Although the supply of good scrap is not large, the situation is a trifle easier than a week ago. The continued pressure on prices by the mills has given the market a tone of softness, and, accordingly, dealers are bidding 25c. a ton less on heavy melting steel and No. 2 wrought than a week ago. Demand for the cast iron grades has improved and, since these grades did not advance with the steel grades, prices are unchanged.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.

No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

German Cable Exports Gain

HAMBURG, GERMANY, Sept. 30.—Exports of cable continue to increase. The total in the first eight months of this year was 38,100 tons, compared with 49,000 tons in all of 1928, 42,000 tons in all 1927 and 31,800 tons in all of 1926. Shipments of cable to South American markets registered a considerable gain in the first seven months of this year, Argentina receiving 8828 tons compared with 5139 tons in the same period of 1928. The total value of cable exported in the first eight months of this year was about 40,000,000 m. ($9,520,000).

The Central Iron & Steel Co., Harrisburg, Pa., has moved its Boston office from 131 State Street to the Statler Building, Park Square. G. T. Armstrong is district manager.

Buffalo

Ford Motor Co. Buys Pig Iron—Mill Operations Show No Gain—Large Purchase of Steel Scrap

BUFFALO, Oct. 15.—The Ford Motor Co. has placed a tonnage of high silicon malleable pig iron with a Buffalo furnace for water shipment, and is reported to be in the market for an additional tonnage of the same grade of iron, which will probably be placed with another maker. The exact amount of the iron placed is not known, but it is reported to be around 5000 tons. The price was not disclosed. Inquiry for pig iron has fallen off, with a total of 3000 tons reported. Included in this is one lot of 1000 tons of foundry iron for New England shipment. The Worthington Pump & Machinery Corporation, which bought 1600 tons last week, is understood to have placed part of this iron with a Buffalo furnace.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—Operation of Buffalo mills shows no increase over the past week, with 70 per cent the average. A Buffalo fabricator took 170 tons of structural steel for a new job at the Elmira Reformatory, and an inquiry is out for 200 tons of structural for a school in the town of Amherst. The reinforcing bars for the new Attica prison, totaling 2400 tons, are understood to have been placed with a Chicago company.

Old Material.—A Buffalo steel plant has bought a large tonnage of No. 1 and No. 2 heavy melting steel, paying $15.50 for the No. 1 steel and $14 for No. 2. A sale of considerable tonnage of stove plate is noted at $12.75. It is probable that about 5000 tons was involved. There is a fair demand for malleable scrap. One of the railroads recently closing a list obtained $20, Buffalo, for this scrap, though all of it went out of town. A sale of 1000 tons of cast iron wheels at $13.50 is noted, and a new borings order is out at $12. Dealers are expecting that another tonnage of No. 1 machinery cast and No. 1 heavy melting steel will be purchased within a week. Stocks in dealers' yards are heavy, and this also applies to most of the consumers. The largest consumer in the district reports that its stock of scrap is the heaviest of any time in months, receiving as high as four boat loads of material a week from Detroit. Its total of boat shipments during the season runs well over 200,000 tons.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.50 to $16.50
No. 2 heavy melting steel	14.00 to 14.50
Scrap rails	16.00 to 16.50
Hydraul. comp. sheets	14.25 to 14.50
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.75 to 16.00
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	8.00 to 8.50
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	18.00 to 18.50
Coil and leaf springs	18.00 to 18.50
Rolled steel wheels	18.00 to 18.50
Low phos. billet and bloom ends	19.00 to 19.50
Electric Furnace Grades:	
Short shov. steel turnings	12.50 to 13.00
Blast Furnace Grades:	
Short mixed borings and turnings	11.50 to 12.25
Cast iron borings	11.50 to 12.00
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	15.50 to 16.00
Stove plate	12.50 to 12.75
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	13.50
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Canada

Pig Iron Prices Are Reduced $1 a Ton

TORONTO, ONT. Oct. 15.—A reduction of $1 a ton in Canadian pig iron prices, effective in both Toronto and Montreal markets, has been announced. This cut was made in an effort to shut out Buffalo competition in the Toronto market and Port Henry competition in the Montreal district. With Buffalo iron quoted at $18, the price laid down to consumers in Toronto, duty and freight paid, is approximately $24 a ton, whereas the drop in the Canadian price brings the local quotation to $23.60 for No. 1 iron. United States producers, however, continue to supply the Canadian agricultural implement industry, as iron for these plants enters the country free of duty. A falling off in demand for pig iron has occurred. Curtailment is directly due to the decline in forward delivery contracts. Most of the melters who place quarterly contracts are now covered to the end of the year. Spot demand, however, is well sustained and showing improvement in some localities. The Algoma Steel Corporation, Sault Ste. Marie, Ont., has blown out one of its blast furnaces and now has two stacks operating, making a total of eight active furnaces of a total of 11 in Canada.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—Demand has declined during the past two weeks, but fabricators are still running full time and report large backlogs.

Old Material.—Business failed to show improvement during the week, although sales are holding at a level higher than a year ago. Prices are firm.

Dealers' buying prices:

	Per Gross Ton

Fabricated Structural Steel

Thirty Per Cent of Lettings, Totaling 23,000 Tons, Are for Pacific Coast Work

APPROXIMATELY 30 per cent of the structural steel lettings in the past week, totaling 23,000 tons, were for construction work on the Pacific Coast. The tonnage in the aggregate was about evenly divided between industrial structures and buildings for other purposes. Thirty-six hundred tons for a power house at Powerton, Ill., and 3000 tons for an office building at Los Angeles, Cal., were the largest awards.

Inquiries, at 49,000 tons, were less than half of those of the previous week. Almost 20,000 tons of fresh inquiries came out in the New York district, where business in prospect is unusually heavy. Among the new jobs on which bids are being taken are a New York office building, requiring 9400 tons, a viaduct and suburban stations at Philadelphia for the Pennsylvania Railroad, 14,000 tons, and a New York subway section, 6800 tons. Awards follow:

SPRINGFIELD, MASS., 100 tons, warehouse for Gilbert & Barker Mfg. Co., to Palmer Steel Co.

HOLYOKE, MASS., 100 tons, paper plant, to Haarmann Steel Co.

BOSTON & ALBANY RAILROAD, 500 tons, roundhouse at Springfield, Mass., to Haarmann Steel Co.

STATE OF NEW YORK, 125 tons, highway bridges, to American Bridge Co.

NEW YORK, 500 tons, Roosevelt Memorial at Seventy-seventh Street and Central Park West, to Easton Structural Steel Co.

NEW YORK, 2300 tons, apartment building at Park Avenue and Seventy-third Street, to A. E. Norton, Inc.

NEW YORK, 1200 tons, apartment building on Seventy-second Street, to Paterson Bridge Co.

BOUND BROOK, N. J., 435 tons, building for Calco Chemical Co., to Levering & Garrigues Co.

PHILADELPHIA, 350 tons, alteration work for Corn Exchange National Bank & Trust Co., to McClintic-Marshall Co.

PHILADELPHIA, 160 tons, bridge for Pennsylvania Railroad, to McClintic-Marshall Co.

PENNSYLVANIA RAILROAD, 700 tons, work in West Philadelphia, to McClintic-Marshall Co.

CHESAPEAKE & OHIO RAILROAD, 700 tons, bridge at Ceredo, W. Va., to American Bridge Co.

AMBRIDGE, PA., 150 tons, electric welding building for National Metal Molding Co., to Jones & Laughlin Steel Corporation.

ROME, N. Y., 200 tons, New York Central grade crossing improvement, to McClintic-Marshall Co.

ELMIRA, N. Y., 170 tons, shop for Elmira Reformatory, to Kellogg Structural Steel Co.

BUFFALO, 800 tons, Buffalo *Courier-Express* building, to McClintic-Marshall Co.

CLEVELAND, 270 tons, Lakewood Land & Securities Co. Lakewood store for Bailey Co., to Kilroy Structural Steel Co.

RIVER FOREST, ILL., 300 tons of steel and 100 tons of castings for Bowman Dairy Co., to A. F. Anderson, Chicago.

POWERTON, ILL., 3600 tons, power house, to Mississippi Valley Structural Steel Co.

JANESVILLE, WIS., 700 tons, Monterey overhead bridge, to Lakeside Bridge & Steel Co.

MILWAUKEE, 130 tons, Oklahoma Avenue bridge, to Worden-Allen Co.

MADISON, WIS., 650 tons, University of Wisconsin field house, to Mississippi Valley Structural Steel Co.

TWO RIVERS, WIS., 200 tons, Hamilton Mfg. Co., to Vulcan Mfg. Co., Fond du Lac, Wis.

STEVENS POINT, WIS., 200 tons, Whiting Plover paper mills, to Wausau Iron Works.

GREAT NORTHERN, 400 tons, tender tanks, to Williamson Brothers Boiler Works.

ILLINOIS CENTRAL, 120 tons, bridge, to American Bridge Co.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 275 tons, bridges, to American Bridge Co.

UNION PACIFIC, 425 tons, bridges, to an unnamed bidder.

DENVER, 1200 tons, viaduct, to American Bridge Co.; previously reported to an unnamed bidder.

OAKLAND, CAL., 150 tons, apartment building on Lenox Avenue, to Herrick Iron Works.

OAKLAND, 140 tons, hotel, San Pablo and Twenty-fourth Streets, to Herrick Iron Works.

OAKLAND, 120 tons, factory for Wills Motor Co., to Pacific Coast Engineering Co.

OAKLAND, 240 tons, transit shed No. 2 for Port Commission, to Pacific Coast Engineering Co.

SAN FRANCISCO, 450 tons, canning plant at Cagayana, Philippine Islands, for California Packing Corporation, to United States Steel Products Co.

SAN FRANCISCO, 250 tons, canning plant for California Packing Corporation, Cape Haitian, Tahiti, to United States Steel Products Co.

LOS ANGELES, 3000 tons, office building, Ninth Street and Broadway, to McClintic-Marshall Co.

LOS ANGELES, 1500 tons, Los Angeles Stock Exchange Building, to Consolidated Steel Corporation.

TACOMA, WASH., 150 tons, hangar, to Star Iron Works; previously reported to an unnamed bidder.

TACOMA, 150 tons, smelter addition, to Star Iron Works.

MARSHFIELD, ORE., 400 tons, power house, to an unnamed bidder.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 9400 tons, Salmon Building at Fifth Avenue and Forty-second Street.

NEW YORK, 6800 tons, section 7, route 108, of subway in Queens; bids due Oct. 25.

NEW YORK, 2300 tons, apartment building at 895 Park Avenue.

NEW YORK, 1000 tons, apartment building at 992 Park Avenue.

BROOKLYN, 4000 tons, Kings County Hospital; new bids being taken.

PENNSYLVANIA RAILROAD, 14,000 tons, viaduct and suburban stations at Philadelphia.

PASSAIC, N. J., 1000 tons, building for United States Rubber Co.

PASSAIC, N. J., 250 tons, Young Women's Christian Association Building.

PHILADELPHIA, 1500 tons, junior high school.

FORT WAYNE, IND., 800 tons, theater.

LANSING, MICH., 1700 tons, office building for R. E. Olds Co.

CHICAGO, 900 tons, Swedish Engineers' Society Building.

CHICAGO, 500 tons, 124th Field Artillery Armory; Great Lakes Construction Co., general contractor.

CHICAGO, 950 tons, Wieboldt department store on Sixty-third Street.

MILWAUKEE, 4000 tons, Northwestern Mutual Life Building; plans out.

OMAHA, NEB., 2000 tons, addition to Union Pacific Station.

EVERETT, WASH., 1400 tons plates for pipe line; bids Oct. 24.

NORTH BEND, ORE., 400 tons, power house; bids being taken.

LONG BEACH, CAL., 970 tons, municipal auditorium; bids being taken.

PHOENIX, ARIZ., 171 tons, bridges on Holbrook-Lupton highway; bids Nov. 4.

SACRAMENTO, CAL., 276 tons, overhead crossing at California Park; bids Nov. 6.

Fire Protection and Prevention

(*Concluded from page* 1042)

stalled; but if this is not advisable the alarm may be sounded by ringing a bell or by word of mouth. Alarms for fire-drills should be sounded only by the fire marshal. Upon the sounding of an alarm in case of actual fire the fire marshal assumes control of the situation and directs the fighting by orders to the squad captains. Upon arrival of the city fire department that control is relinquished and the authorities take full charge.

Instruction of Employees Is Essential

We are particular about educating employees along the lines of (accident) safety and conducting safety campaigns, both to prevent accidents and to treat them when they occur. An educational and instructive campaign to prevent fires and to plan what to do when they occur is no less important. Such education should be along the lines of fire prevention, fire fighting and obeying fire regulations. The average workman needs such instruction just as much as a child. Employees like to know that there is adequate fire protection and that they can leave the building with safety in case of a fire.

A campaign to prevent fires is necessary as a prerequisite to saving property and human life. Losses from this cause frequently go beyond the individual plant suffering from fire loss, because often one or more other establishments depend upon goods produced by the plant to maintain production. On the other hand, one or more establishments may depend largely upon goods consumed by the plant to keep them running at full capacity. Industry must insist on fire protection, to protect itself from destruction and the waste of material wealth.

Non-Ferrous Metal Markets

Tin at Lowest Level Since 1924—Other Metals Quiet and Firm

NEW YORK, Oct. 15.

Copper.—Despite September copper statistics favorable to sellers and made public on Oct. 11, demand continues very light. The statistics show a decrease of nearly 10,000 tons in refined copper stocks and an increase of about 11,000 tons in blister stocks. Thus, the net increase of copper above ground was only about 1000 tons. The drop in stocks was influenced by a two weeks' strike at a New Jersey refinery. September shipments increased less than 2000 tons. It was thought that buying would increase after the announcement of favorable statistics, but there has been very little change in the week. The larger part of the week's selling was to foreign consumers, buying by domestic melters continuing in moderate volume. Prices are unchanged, with electrolytic copper quoted at 18c., delivered in the Connecticut Valley, and Lake copper at 18.12½c., delivered. Copper Exporters, Inc., continues to quote 18.30c., c.i.f. usual European ports.

Tin.—At 42.25c. yesterday and today, spot Straits tin, New York, sold at the lowest price since June 11, 1924, when the quotation was 42.12½c. Sales for the week ended Saturday, Oct. 12, were about 1000 tons, but yesterday the market turned active because of a big break in London prices and 500 tons changed hands, with consumers the principal buyers. In London, sales included deliveries through May. Today demand let up and the market was very quiet. When tin in London declined to £200 a ton recently, the group became buyers but yesterday, when the market turned weak, they did not support it and quotations dropped to the lowest point in several years. Today the London market turned upward, due to buying by a large London house credited as acting for the group. Prices today were £191 2s. 6d. for spot standard, £195 15s. for future standard and £195 12s. 6d. for spot Straits, all considerably lower than a week ago. The Singapore market today was £197 5s. London warehouse stocks, at 12,712 tons, were again reported as the largest in history.

Lead.—Conditions have changed little from those ruling a week ago. Buying for November continues with some purchases for October delivery, but the total volume is not large.

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Oct. 15	Oct. 14	Oct. 11	Oct. 10	Oct. 9
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½

- Lead, bar ..... 9.62½c. to 10.12½c.
- Antimony, Asiatic ..... 10.50c. to 11.00c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) .. 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 29.50c. to 30.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 48.00c.
- Tin, bar ..... 50.00c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 8.00c. to 8.25c.
- Lead, American pig ..... 7.55c. to 7.75c.
- Lead, bar ..... 9.75c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.75c.
- Babbitt metal, high grade ..... 52.00c.
- Solder, ½ and ½ ..... 30.25c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	15.00c.	16.50c.
Copper, hvy. and wire	14.75c.	16.25c.
Copper, light and bottoms	12.75c.	14.00c.
Brass, heavy	8.25c.	9.25c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.50c.	6.00c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.00c.
Sheet aluminum	13.75c.	16.00c.
Cast aluminum	12.00c.	14.00c.

Prices are unchanged, with the leading producer at 6.70c., St. Louis, and the American Smelting & Refining Co. at 6.90c., New York, as its contract price.

Zinc. — Conditions are somewhat mixed as to prices. Leading producers still maintain 6.80c., East St. Louis, as their quotation for prime Western, and it is known that substantial sales have been made during the week at that level. There have also been some sales of small amounts at 6.75c. It is known that stocks in consumers' hands are very low in some cases. Should these be replenished, it is contended that there will by no means be enough metal under 6.80c. to supply the demand, and this demand must materialize before long. It was expected to appear before this. Mining of ore has been resumed in the Tri-State district, and production last week was estimated at about 13,000 tons, which is close to the output previous to the curtailment. Shipments were more than 12,100 tons and sales about 10,700 tons, with the surplus estimated at 41,612 tons, compared with about 47,000 tons a week ago. The quotation is still $44, Joplin.

Antimony.—Because China is again facing a revolution with the possibility of a demoralization of its trade with other countries, a large importer in New York has sent out a circular to the effect that, while there is no indication of an early shortage, conditions in China could lead to an advance in price. New York dealers are offering Chinese antimony at a level somewhat lower than it can be purchased in China. A good buying for November-December arrivals as an insurance against contingencies in China is not unlikely. Quotations today are 8.50c., New York, duty paid, for all positions.

Nickel. — Wholesale lots of ingot nickel are quoted at 35c. per lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 15.—Prices generally are firm with the exception of tin and antimony, which are weak under the influence of foreign markets. Sales are in fair volume. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 43.25c.; lead, 6.80c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.37½c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper, bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Santa Fe Purchases 5805 Cars, Southern 3500, Baltimore & Ohio 1000

WITH orders having been placed for 11,579 cars and with inquiries having appeared for 5860 cars, the past week was one of the most active of the year in the railroad equipment market. The Santa Fe and the Southern bought 5805 and 3500 cars respectively, the purchase of the latter having been in addition to the 1500 cars contracted for the previous week. The Great Northern will build 1300 cars in its own shops. The Baltimore & Ohio has ordered 1000 cars and 1500 car bodies.

Outstanding among inquiries are 3815 cars for the St. Louis-San Francisco and 2060 for the Argentine State Railways. The Burlington is asking for bids on 20 locomotives and the Seaboard Air Line on 15. The Chicago, Indianapolis & Louisville is expected to purchase 10 locomotives. Details of the week's business follow:

Interstate Commerce Commission has granted authority to Chicago, Indianapolis & Louisville Railroad to issue equipment trust certificates to the value of $520,000 to be applied toward purchase of 10 locomotives at total cost of $650,850.

Southern has ordered 3500 steel frame automobile cars from American Car & Foundry Co., in addition to 1500 hopper cars from Pressed Steel Car Co., as reported last week.

Santa Fe has purchased 1500 box cars, 500 refrigerator cars, 10 chair cars, 10 smoking and five dining cars, two observation cars, 19 mail and baggage, two gas-electric and three mail and smoking cars from Pullman Car & Mfg. Corporation, 200 gondola cars from Standard Steel Car Co., 500 box and 500 automobile cars from Pressed Steel Car Co., 300 stock cars from Pennsylvania Car Co., 1000 box cars from General American Car Corporation, 300 gondola, 500 box, 200 ballast, 104 caboose and 150 flat cars from American Car & Foundry Co. One hundred tank cars with cast steel underframes are still to be placed.

St. Louis-San Francisco is in the market for 2500 box, 800 gondola, 500 automobile, 10 baggage and five baggage and mail cars.

Great Northern will build 30 locomotives, 1000 box and 300 ore cars in its own shops, and will buy 1000 gondola cars.

Baltimore & Ohio has ordered 1500 box car bodies from Standard Steel Car Co. and 1000 steel gondola cars from Bethlehem Steel Corporation.

New York, New Haven & Hartford is inquiring for 12 steel underframes.

St. Louis-San Francisco has ordered 10 box car underframes from American Car & Foundry Co.

Columbian Gasoline Corporation has ordered 25 tank cars from General American Tank Car Corporation.

Republic Iron & Steel Co. has ordered 43 gondola car bodies from Pressed Steel Car Co.

Argentine State Railways are inquiring in the American market for 1102 box cars, 500 gondola cars, 398 platform cars and 60 caboose cars.

Burlington is asking for prices on 12 4-6-4 and eight 4-8-4 type locomotives.

Seaboard Air Line will buy four Mikado, five switch and six Decapod type locomotives.

Reinforcing Steel

With Awards of 3000 Tons, Week Has Been Quiet

REINFORCING steel awards in the past week totaled only 3000 tons. With the exception of 600 tons for a sewage disposal plant at Chicago, lettings ranged from 100 to 300 tons each. Awards follow:

STONECOE, N. Y., 900 tons, building for New York Traprock Co., to Concrete Steel Co.

ALLANTOWN, PA., 100 tons, bridge at Wyoming Street, to Taylor-Davis Co.

BOSTON, 215 tons, banking building, to Joseph T. Ryerson & Son, Inc.

NORWALK, CONN., 150 tons, sewage disposal plant, to Concrete Steel Co.

GLENCOE, N. Y., 100 tons, grade school, to Kalman Steel Co.

PASSAIC, N. J., 100 tons, addition to United States Rubber Co.'s plant, to Concrete Steel Co.

WANAQUE, N. J., 150 tons, reservoir, to Concrete Steel Co.

PALISADES PARK, N. J., 200 tons, bridge, to unnamed fabricator.

ATTICA, N. Y., 2400 tons, new State prison, to American System Co., previously reported placed with the Bourne-Fuller Co.

BUFFALO, 240 tons, *Courier-Express* building, to Joseph T. Ryerson & Son, Inc.

SOUTH BEND, IND., 100 tons concrete mesh, to a general contractor by Concrete Engineering Co.

CHICAGO, 600 tons, Northwest sewage treating plant, to Concrete Steel Co.

CHICAGO, 125 tons, building for the Kroeger Grocery Co., to an unnamed bidder.

CHICAGO, 285 tons, Parker Junior High School, to Calumet Steel Co.

CLAYTON, MO., 125 tons, St. Louis County hospital, to Missouri Rolling Mills Corporation.

SEATTLE, 200 tons, market building on Third Street, to Pacific Coast Steel Co.

BELLINGHAM, WASH., 100 tons, office building for Puget Sound Light & Power Co., to Pacific Coast Steel Co.

OLYMPIA, WASH., 175 tons, Thurston County Court House, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

HARRISBURG, PA., 140 tons, freight building for Pennsylvania Railroad.

PHILADELPHIA, 500 tons, sewer and bulk head on Springgarden Street.

OLYMPIA, WASH., 233 tons, Lake Union bridge; bids Nov. 19.

Non-Ferrous Ingot Metal Unfilled Orders

CHICAGO, Oct. 15.—On Oct. 1, unfilled orders for brass and bronze ingots and billets on the books of the members of the Non-Ferrous Ingot Metal Institute amounted to a total of 16,246 net tons, according to an announcement of the Institute issued today. On Sept. 1, the unfilled orders were 15,065 tons.

PERSONAL

S. L. BENGTSON, of the International Construction Co., London, England, which has been appointed consulting engineer on the new iron and steel plant to be erected at Pretoria, South Africa, by the South African Iron & Steel Corporation, will arrive in New York, Oct. 22, on the Majestic, for a short tour of American steel centers. He will make his headquarters at the National Bank of South Africa, 44 Beaver Street, New York.

—

M. E. DANFORD, for some seven years works manager of the Middletown division of the American Rolling

M. E. DANFORD

Mill Co., Middletown, Ohio, has been appointed assistant vice-president of the company. He has been connected with the company since Feb. 1, 1910.

—

E. J. MOHR, for many years sales manager for the Kinite Corporation, Milwaukee, has become manager of industrial sales for the Gunite Corporation, Rockford, Ill.

—

DR. RICHARD MOLDENKE, consultant in foundry operations, Watchung, N. J., spoke on the evolution of the foundry at the first fall meeting of the Philadelphia Foundrymen's Association, Oct. 9, at the Manufacturers Club, Philadelphia.

—

DWIGHT CLARK WHEELER, who has been prominently identified with the growth of the Acme Shear Co., Bridgeport, Conn., has been elected president of that company.

—

HEINRICH CALLOW, president, Callow & Co., Bielefeld, Germany, machinery manufacturers, is spending several weeks in the United States visiting industrial plants.

—

ROBERT C. NORTON, Oglebay, Norton & Co., ELTON HOYT, II, Pickands, Mather & Co., and T. P. DURELL, president American Fork & Hoe Co., have been elected directors of the American Shipbuilding Co. Mr. Hoyt fills the vacancy caused by the death of Henry S. Pickands.

—

A. E. MCKINSTRY, vice-president International Harvester Co., Chicago, was elected president of the National Association of Farm Implement Manufacturers at its thirty-sixth annual convention, held in Cleveland last week. H. G. NEWCOMER, president, Eureka Mower Co., Utica, N. Y., was named executive chairman.

—

T. H. KING and WILLIAM J. LEPPERT have organized the Maryland Machinery Co., with offices in the Snow Building, Baltimore. The company will represent manufacturers of machine tools, woodworking machinery, power transmission machinery and steam pumps in Maryland, Virginia and the District of Columbia. Mr. King was for many years with the Landis Tool Co. and the Wayne Tool Co., Waynesboro, Pa. Mr. Leppert was for a number of years with the Aumen Machinery Co., Baltimore.

—

KENNETH B. LEWIS, manager of sales, wire machinery department, Morgan Construction Co., Worcester, Mass., is returning from Mexico this week. He has been there in the interests of the company in connection with the installation of multiple-head drawing blocks of the Morgan-Connor type.

—

C. E. RUTH, formerly in the engineering department of the Rust Engineering Co., Pittsburgh, has become district sales manager for northern Pennsylvania, Ohio, western New York and Ontario, of the Homestead Valve Mfg. Co., Coraopolis, Pa.

—

GEORGE M. DEMOREST, who has been engaged in sales promotion work on speed reducers, power transmission and conveyor equipment for over 12 years, has been appointed Pittsburgh district representative for the Palmer-Bee Co., Detroit.

—

ROBERT E. MCGILL and EDWARD R. BRAZEL have been appointed Western manager and district manager respectively with offices in San Francisco, for Aluminum Industries, Inc., Cincinnati, to handle the distribution of Permite-Diamond products.

—

ALEXANDER F. JENKINS, president Alexander Milburn Co., Baltimore, sailed Oct. 12 for England.

—

HARRY W. CROSS, for the past five years vice-president of the Arch Machinery Co., Pittsburgh representative of Manning, Maxwell & Moore, Inc., New York, has been appointed works manager of the latter company's Putnam Machine Works, Fitchburg, Mass., succeeding W. O. FORMAN, who has resigned.

—

A. H. D'ARCAMBAL, consulting metallurgist, Pratt & Whitney Co., Hartford, Conn., will address the Worcester chapter of the American Society for Steel Treating, Oct. 17, at Rebboli's Restaurant, Worcester, Mass. His subject will be "The Machineability of Metals."

—

CHARLES REES, who has been consulting engineer to the Vanadium Corporation of America, New York, since 1923, has been appointed vice-president, in charge of mining operations. After his graduation from the University of Wisconsin, he engaged in mining activities for various com-

CHARLES REES

panies, including the Minnesota Iron Mining Co., the Oliver Iron Mining Co. and the Midvale Steel & Ordnance Co.

—

W. WORLEY KERLIN, research chemist, Enterprise Sand Co., Conneaut, Ohio, will speak on "Grain Sizes and Its Effect on the Properties of Molding Sand" at the regular monthly meeting of the Pittsburgh Foundrymen's Association, to be held at the Fort Pitt Hotel on Oct. 21.

—

G. H. HEDRICK, recently vice-president of the Thomas Spacing Machine Co., has been appointed chief engineer of the Gem Mfg. Co., Pittsburgh, maker of railroad sheet metalware and special stampings.

—

H. A. BRASSERT, president, H. A. Brassert Co., Chicago, has returned from England, where his firm has been retained as consultant for a number of iron and steel companies of England and Scotland.

—

JOSEPH F. PFLUM has been appointed representative in the Dayton and Cincinnati districts, with offices at 3721 St. Lawrence Avenue, Cincinnati, by the Reed-Prentice Corporation, Worcester, Mass.

CLINTON S. DARLING, for several years in charge of sales in the western territory for the Pennsylvania Crusher Co., Philadelphia, has been appointed assistant to COL. GUILFORD C. BABCOCK, president, 4-One Box Machine Makers, Rockaway, N. J., the licensing company for the manufacture and sale of 4-One wirebound boxes.

—

JAMES F. CROFT, who resigned as metallurgist for Mackintosh-Hemphill Co., Pittsburgh, on Sept. 15, has become metallurgist, in charge of the roll department, of the Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa.

—

J. P. GILL, metallurgist for the Vanadium Alloys Steel Co., Latrobe, Pa., will address the New Haven chapter of the American Society for Steel Treating on "Tool Steels—Their Manufacture, Inspection and Selection" in the Bristol Mfg. Co. auditorium, Waterbury, Conn., Oct. 17.

—

ERNEST MOELLER has been elected president of the newly-formed Industrial & Combustion Engineering Corporation, 303 Protective Life Building, Birmingham. Vice-presidents are GEORGE C. MAPES and LOUIS LYON, JR.

—

IRWIN B. LAUGHLIN, who has been appointed United States Ambassador to Spain by President Hoover, was formerly identified with the Jones & Laughlin Steel Corporation, Pittsburgh, having served as treasurer of the company until 1903, when he resigned to enter diplomatic service.

—

WALTER C. ALLEN, president, Yale & Towne Mfg. Co., Stamford, Conn., has been made a director of the Western Electric Co., Inc.

—

BRADLEY STOUGHTON, professor of metallurgy, Lehigh University, Bethlehem, Pa., has been awarded the Grasselli Medal for 1929 for his paper "Light Structural Alloys" written several years ago. The formal presentation will be made on Nov. 8 by the American Chemical Society.

Wages of European Steel Workers Advancing

HAMBURG, GERMANY, Sept. 30.—Wages continue to advance in the European steel industry. Wages in Luxemburg were increased 5 per cent in September, the second advance this year, and Czechoslovakian steel producers have granted an increase of 2½ to 5 per cent and a larger bonus for overtime work, effective Oct. 1. Polish steel workers are seeking a 10 per cent wage increase, and it is believed probable that the mills will agree to advances of 5 to 7½ per cent. Steel workers in Belgium and employees in the heavy hardware industry in Germany are seeking further wage increases.

OBITUARY

DAVID L. EYNON, president Pittsburgh Rolls Corporation, Pittsburgh, whose sudden death on Oct. 5 was mentioned in THE IRON AGE last week, had long been prominently identified with the roll industry in this country. He was one of a group of Welshmen who have contributed heavily to the development of roll turning, roll design and rolling mills in the United States, which among others included the late D. R. Mathias, who had a prominent part in the construction of the mills of the Illinois Steel Co., and James E. Jones, who now is superintendent of the roll department,

D. L. EYNON

South works, Illinois Steel Co., Chicago. Mr. Eynon, who was born in Dowlais, Wales, in 1861, came to this country when he was 18 years of age and located in Philadelphia, where he joined his cousin, William D. Eynon, then in charge of the roll shop of Hughes & Patterson. He left that company a few years later to take a position with the Pencoyd Iron Works, now the Pencoyd works of the American Bridge Co. His next connection was with a rolling mill company in Bridgeport, Conn., following which he went to the Colorado Fuel & Iron Co., Pueblo, Colo., and became associated with James E. Jones. In 1904, after a brief identification with the Jones & Laughlin Steel Co., Pittsburgh, he joined the Phoenix Roll Works, Pittsburgh, as superintendent. When that company was reorganized in 1917 as the Pittsburgh Rolls Corporation, he became its first president.

—

HARRY SHEAFF PAUL, for many years president of the Verona Tool Works, Verona, Pa., died on Oct. 10, at his home in Oakmont, Pa., aged 73 years. He was born at Pittsburgh, and became associated with the Verona company soon after leaving school. He served for a time as superintendent and later became president, having served in that capacity for 30 years prior to his retirement 10 years ago. He had been active in political and financial circles in western Pennsylvania.

—

GEORGE F. ERNST, sales manager of the A. Leschen & Sons Rope Co., St. Louis, died in that city on Oct. 9, aged 64 years.

—

FRANCIS WILLIAM GILBERTSON, chairman of the board and managing director, W. Gilbertson & Co., Ltd., Pontardawe, Glamorgan, Wales, died Oct. 8, aged 56 years. He was closely associated with the Welsh steel, tin plate and galvanizing industries for many years, was chairman of the Swansea Metal Exchange, had been a member of the Iron and Steel Institute since 1896, and was a past member of council of the institute.

—

JOHN WILLIAMS, managing director, Clayton Tin Plate Co., Ltd., Pontardulais, Wales, died Oct. 8, aged 69 years. He was one of the pioneers of the Welsh tin plate trade and a member of the Iron and Steel Institute since 1908.

—

FRANK HENDERSON, manager of the Cleveland office of the Combustion Engineering Corporation, died suddenly on Sept. 25, aged 53 years.

—

STEPHEN BALKWILL, president, Balkwill Manganese Crossing Co., Cleveland, and associated with the Cleveland Frog & Crossing Co. for 23 years, died Oct. 9, aged 58 years. His business connections also included a part ownership in the Cleveland Steel Casting Co. He attended Case School of Applied Science, Cleveland, and was a member of a number of engineering societies.

—

FREDERICK KAHL, owner and founder of the Frederick Kahl Iron Foundry, Detroit, died at his home in Detroit on Oct. 11, aged 72 years. In his youth Mr. Kahl entered the employ of the Frontier Iron Works in Detroit. In 1888 he organized his own company, of which he was the active head until illness compelled him to retire two years ago.

—

WILLIAM D. JOHNSON, president of the Milwaukee Boiler Co., Milwaukee, which he founded, died Oct. 7, following an illness of one year, which did not bar him from retaining active charge of the business until a few weeks before his death. He was born in Milwaukee in 1869.

—

JOSEPH E. HUSTON, secretary and treasurer, Connersville Blower Co., Connersville, Ind., died of a heart attack at his home in Connersville, Sept. 22, aged 67 years. He had been connected with the company since its inception in 1893.

—

GEORGE B. CURTIS, vice-president and treasurer of the St. Louis Struc-

tural Steel Co., East St. Louis, Ill., died in his home there of heart disease after an illness of several weeks, aged 57 years.

—

W. A. KINGSLEY, for many years active in the iron and steel industry, died suddenly at Orlando, Fla., on Oct. 12. He began his business career nearly 50 years ago with the Pomeroy Iron & Steel Co., Pomeroy, Ohio, of which he was general manager. Later he went with the Union Iron & Steel Co., Youngstown, and when that company was taken over by the Carnegie Steel Co., he was made general manager of the hoop mills in the Youngstown district. Upon the formation of the Steel Corporation, he became manager of sales at Chicago for the American Steel Hoop Co. Later he served as manager of the General Fireproofing Co., Youngstown, and prior to this retirement, held a similar position at the Garry Iron & Steel Co., Cleveland.

—

R. W. BELL, formerly general superintendent of motive power for the Illinois Central, died suddenly Oct. 14. He retired from active service Oct. 1.

—

WILLIAM PAUL MARTIN, chairman of the board of directors of the Stromberg Electrical Co., Chicago, died of heart disease Oct. 14, aged 63 years. He was formerly general manager of the Union Carbide Co. and of the Peoples Gas Light & Coke Co., Chicago.

Chicago's Expansion in Steel Production

President Buffington of Illinois Steel Co. Tells of Its Beginnings and Growth

THE value to a community of an ample supply of iron and steel is universally recognized, and the extent of its development is regarded as a measure of community strength and commercial importance, said E. J. Buffington, president, Illinois Steel Co., in an address delivered Oct. 16 before the Chicago Association of Commerce.

The beginning of the industry in Chicago was about contemporaneous with the invention and use of the Bessemer process. In 1857 Capt. E. B. Ward, owner of a small iron furnace and bloomery in Wyandotte, Mich., built a blast furnace and rolling mills in Chicago on the north branch of the Chicago River. The plant was known as the North Chicago rolling mill. In 1864 the first steel ingots made in this country by the Bessemer process were produced in an experimental plant at Wyandotte, sent by sailing vessel to the North Chicago rolling mill and there were rolled into rails. These were the first steel rails made in the United States.

In 1869 ownership of the several plants in Chicago, Joliet and Milwaukee, was consolidated into one company and incorporated as the Illinois Steel Co. This was the first merger of important steel-producing interests in the United States, a forerunner of subsequent larger mergers which integrated a large part of the industry into companies owning many plants and large supplies of practically all essential raw materials.

Growth and development of the industry, especially during recent years, has been more rapid in the Chicago district than elsewhere in the United States. Between the years 1912 and 1928 annual steel production in the United States as a whole increased from 30,000,000 tons to approximately 50,000,000 tons, equivalent to an increase of 60 per cent, while production in the Chicago district increased from 4,400,000 tons in 1912 to over 9,000,000 tons in 1928, or nearly 107 per cent.

It is estimated that the iron and steel industry in the Chicago district employs about 75,000 workmen and disburses payrolls aggregating $150,000,000 annually. Production last year of over 9,000,000 tons of steel in the Chicago district required the assembly of approximately 60,000,000 tons of raw materials.

Nine-Month Record in Fabricated Steel

WASHINGTON, Oct. 15.—Fabricated structural steel orders reported in September totaled 246,016 tons, or 82 per cent of the capacity of the 296 firms making returns to the Department of Commerce. Bookings reported in August were 300,008 tons, according to 223 firms, representing 95 per cent of their capacity.

Computed orders were 315,700 tons in September, compared with 365,750 tons in August. Computed shipments were 319,550 tons, or 83 per cent of capacity, against 346,500 tons, or 90 per cent of capacity in August.

Computed bookings for the first nine months of the current year were 2,952,950 tons, against 2,553,750 tons for the corresponding period of last year. Computed shipments were 2,671,900 tons and 2,252,250 tons respectively.

Both orders and shipments, on the computed basis, were higher for the nine-month period than ever before.

Navy Calls for Bids on 21,490 Tons of Steel

WASHINGTON, Oct. 15.—The Navy Department has sent out schedules to steel manufacturers covering requirements for the three light cruisers being built in navy yards, and will open bids on Nov. 1 for approximately 7800 tons of special treatment plates and on Nov. 5 it will open bids for 8593 tons of medium plates, 637 tons of high-tensile plates, 3800 tons of medium shapes and 300 tons of high-tensile shapes.

Europe's Steel Cartels Face Critical Situation

LONDON, ENGLAND, Oct. 7.—It now leaks out that the steel conference at Vienna [see page 1080, this issue] came near being a failure. The final agreements were the result of compromises, and the extreme feeling now is that if the European steel industry does not brace up in the next three or four months the rail cartel as well as the general steel cartel may expire.

Increased quotas were demanded by the Belgians and by most of the Germans and increased total tonnages. In the German delegation there was a split as to the allotments among the German plants — differences which some think will take five or six months to settle. The French, on the other hand, asked for lower rollings by 10 per cent or so.

The situation was saved, at least temporarily, by proroguing the meeting to Dec. 14 at Düsseldorf, by provisionally continuing the cartel until March 31, by agreeing to hold the fourth quarter rollings at the third quarter basis and by reducing penalties for exceeding quotas to 25 per cent of the previous amounts.

Malleable Castings Well Above Last Year

WASHINGTON, Oct. 15.—Orders for malleable castings in September totaled 50,464 net tons, against 61,982 tons in August, according to reports received by the Department of Commerce from the principal manufacturers. Production amounted to 57,380 tons, representing 59.7 per cent of capacity, against 68,651 tons, or 70 per cent of capacity. Shipments were 61,492 tons, compared with 69,240 tons.

Orders for the first nine months of the current year were 638,336 tons, against 572,264 tons for the corresponding period of last year. Production was 664,772 tons, compared with 586,453 tons last year.

Higher Factory Earnings

Average weekly earnings in representative New York State factories are reported by the State Industrial Commissioner at $30.08 for August. This is nearly 1 per cent above the $29.80 for July and, with the exception of the $30.35 last March, it was the highest for any month so far this year. With the further exception of $30.12 last December, it is the highest for any month on record.

Pig Iron Most Active Item in Europe

British, Belgian and German Operations Heavy—Larger Production of Steel in Several Quarters—Wire Situation Tense

(*By Cable*)

LONDON, ENGLAND, Oct. 14.

PIG IRON demand is sustained and supplies are going into direct consumption, but steel output declined in September and, with export demand for pig iron poor, furnaces are somewhat apprehensive of the future. Cleveland furnaces are generally well sold for the current month, but increasing costs are a disquieting factor.

Hematite iron is active in both the home and export markets so that October deliveries have become less easy to obtain. Prices are unchanged, but concessions are less common.

Finished steel is dull. Some small business has been taken for India and Canada, but export demand is generally quiet. In the domestic market fresh ship contracts are releasing more steel tonnage, but plate mills, especially, are still in need of work.

September exports of pig iron were 32,500 tons of which the United States received 65 tons. Total exports of iron and steel were 299,500 tons.

Continental steel sales here are quiet and prices sagging, especially in semi-finished material and merchant bars. Welsh consumers have bought some sheet bars, but other consuming industries show but little interest in foreign material.

Tin plate demand is good, with 19s. to 19s. 3d. ($4.60 to $4.66) per base box, f.o.b. works port, paid for substantial quantities. Mills are well sold ahead and the general outlook is bright.

Galvanized sheets are quiet and prices easier. Black sheets, Japanese specifications, continue inactive.

Dorman, Long & Co. and Bolckow, Vaughan & Co. have officially announced a plan for merger of their interests, which provides for exchange of shares. The total capital of the new corporation will exceed £17,000,000 ($82,450,000).

Cartel Meeting Results in Compromises

Extended Six Months for Discussion—Reduction of German Penalties Equivalent to Quota Increase

DÜSSELDORF, GERMANY, Sept. 30.—The provisional extension of the International Steel Cartel until March 31, 1930, gives more time to the commission appointed to prepare a definite renewal plan. The official statement of the Vienna meeting of the cartel was that "all groups showed a conciliatory spirit and the unanimous wish is to attain a definite agreement as soon as possible."

From unofficial sources it appears that the meeting was not nearly so satisfactory as the public announcements imply. Opposition developed to the German demand for an increased allotment and a compromise was reached by reducing the German penalties for excess output to 25 per cent of the former amounts. Germany had been paying $1 a ton for overproduction up to 7½ per cent in excess of the quota, $2 a ton on the next 2½ per cent of excess output and $4 a ton on production over 10 per cent more than the quota. Under the provisional agreement for the next two quarters, Germany will pay only 25c. a ton on the first 7½ per cent of excess tonnage, 50c. a ton on the next 2½ per cent of excess and $1 on production over 10 per cent.

In certain quarters it is pointed out that these penalties are so small that, although the German allotment has not been increased, German producers may exceed their quota to a greater extent than formerly at a lower cost in fines. The fact that the total annual allotment for the entire cartel has been continued at 32,000,000 tons is causing some speculation in the steel industry as to future results of what has already been found to be excess production. It is believed that any effort to stabilize export prices, as has been suggested, will prove impossible with such a heavy production program effective.

Extension of the cartel for another

six months gives time for negotiating the renewal of the German domestic syndicates. It is believed that the Ingot Steel Syndicate (Rohstahlgemeinschaft) will have been renewed by the end of the year. Many of the German selling syndicates expire about the middle of next year and their renewal depends largely upon an agreement between the Friedrich Krupp A. G. and the Mannesmann Tube Co.

Wire Competition in Europe Brings Low Prices

HAMBURG, GERMANY, Sept. 30.—While the volume of business in the wire market on the Continent has been increasing, prices have been steadily declining. According to a report of the German Wire Manufacturers' Syndicate, orders during the first three weeks of September exceeded the August total, which was about 15 per cent larger than in July. Prices, however, are receding and galvanized wire has declined to £9 4s. per ton (2.02c. per lb.), bright wire to £7 5s. per ton (1.59c. per lb.) and barbed wire to £11 10s. per ton (2.53c. per lb.). Belgian mills are shading these prices in some cases by several shillings a ton.

The situation in the wire netting market is not much better than in wire. The discount from the British standard list is now 84 to 84¼ per cent, a record low price. Competition among Continental makers of wire netting has become so severe that certain mills have found it impossible to compete and Austrian and Czechoslovakian makers have withdrawn from the market. British manufacturers are also affected and, with their quotations 15 to 20 per cent higher than the Continental prices, are unable to sell wire netting except in such of their own markets as provide a preferential duty on British products.

Italy Plans Regulation of Iron and Steel Industry

WASHINGTON, Oct. 11.—Considerable progress has been made toward outlining a plan to survey the entire Italian iron and steel industry for the purpose of determining the relationship of all its operations, according to an announcement forwarded to the Department of Commerce. One of the chief aims will be to find a means of restraining competition between individual producers, a condition which is reported to have led to serious disorganization in the domestic markets.

Meetings in connection with the survey have been attended by Government officials, representatives of industry and by Professor Guarnieri, commissioner of the National Fascist Metallurgical Association. As a result, it has been decided to take concerted action, with the support of the Italian Government, to reduce costs, systematize production, promote specialization and more efficient operation of plants, and to eliminate unnecessarily long and costly transportation of material and products. This extensive program is said to cover only immediate purposes. Later an effort will be made to regulate the local market and stabilize prices "to the mutual benefit of both the producers and the consumers."

Japanese Steel Imports Increasing

YOKOHOMA, JAPAN, Sept. 17.—Efforts to restrict importation of foreign steel appeared somewhat successful in 1928, but in the first half of this year steel imports registered a considerable increase. A total of 60,690 tons of steel bars was imported in the six months, an average of more than 10,000 metric tons monthly, compared with an average in 1928 of slightly less than 5000 tons a month. Imports of angles in the first half of this year totaled 14,242 metric tons, an average of 2372 tons a month, compared with about 1500 tons a month last year. The only exception to this increase was rails, the imports of which decreased from an average of 3611 tons a month in 1928 to 2828 tons a month in the first half of this year.

International Tube and Wire Rod Cartels Renewed

LONDON, ENGLAND, Sept. 30.—A feature of the conference of the International Wire Rod Cartel at Brussels was the agreement of the French members to an extension of the cartel until the end of 1930 without any stipulation that a French wire manufacturers' syndicate must be established by that time.

Although no changes were decided upon at the recent meeting of the International Tube Cartel, it is understood that some serious differences of opinion have developed between the Continental producers and the British, American and Canadian manufacturers of tubes. Also, German mills are dissatisfied with their production quota.

Germany Expects Orders from Persian Railroad

HAMBURG, GERMANY, Sept. 30.—Contracts for locomotives, cars and track equipment are expected from Persia. The Julius Berger A. G. is the contractor on the northern section of the Persian railroad, which will be 1600 km. (994 miles) long and is to be completed by the end of 1932. The German contractor announces that the first 85 km. (53 miles) of the road has been finished and the Persian Government will shortly inquire for the necessary equipment and rolling stock for that section.

The American Ceramic Society will hold its thirty-second annual meeting in the Royal York Hotel, Toronto, Canada, the week of Feb. 16, 1930.

British Iron and Steel Output in September

LONDON, ENGLAND, Oct. 12. (By Cable).—Pig iron production in September was 664,600 gross tons and that of steel ingots and castings 847,900 tons. This is the third largest pig iron output this year while the steel production is the second largest. The peak in steel was at 859,900 tons in March.

Comparison of recent output with other periods is as follows:

	Pig Iron, Gross Tons	Steel Ingots and Castings, Gross Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—Av. monthly..	550,900	710,400
1929—Av. first half..	599,600	813,800
1929—August	682,000	753,300
1929—September ...	664,600	847,900

India and United States Ship Scrap to Japan

YOKOHOMA, JAPAN, Sept. 17.—Imports of iron and steel scrap at Wakamatsu, site of the Government Steel Works, have been large this year, with the United States and India furnishing practically the entire tonnage. In the first six months of this year the Government works received 79,719 metric tons of scrap, of which 38,857 tons was from the United States and 39,050 tons from India. All other countries contributed only 1812 tons of the total. This compares with 77,640 metric tons imported at Wakamatsu in all of 1928.

German Railroads to Spend $50,000,000

HAMBURG, GERMANY, Sept. 30.—The equipment purchasing program of the German Railroad Corporation for the first half of 1930 has been announced and includes 50 express locomotives, to cost about 7,000,000 m. ($1,666,000); passenger and freight cars, calling for a total expenditure of 70,000,000 m. ($16,660,000), and track equipment valued at about 140,000,000 m. ($33,320,000).

Belgium Importing More Pig Iron

WASHINGTON, Oct. 15.—The demand of the Belgian iron and steel industry for foreign pig iron is steadily growing, according to a report received by the Department of Commerce from Berlin. During the first seven months of 1929, pig iron imports into Belgium, including Luxemburg, totaled 407,000 metric tons, compared with 281,000 tons for the corresponding period of last year.

Exports of pig iron from Germany during the seven months of the current year were more than 135,000 metric tons.

Machinery Markets and News of the Works

Tool Prospects Are Bright

Builders Have Three Months' Backlogs—Norfolk & Western Puts Out Inquiry

ALTHOUGH machine tool sales have been only moderate in volume, prospects for increased buying have brightened as a result of interest stimulated by the National Machine Tool Exposition at Cleveland.

Despite the fact that the index of the National Machine Tool Builders' Association shows that September orders were the lowest of the year, the ratio of unfilled orders to shipments, at 2.76, reached a new high level, indicating that manufacturers have backlogs representing nearly three months' full operations.

The slackening in demand is attributed in large measure to the almost total absence of automobile companies from the market. A large percentage of the total machine tool business in the past few years has come from the motor car industry and the temporary halt in bookings from that source has made it necessary for builders to look to other fields for current orders.

Signs of a revival of interest on the part of railroads have appeared. The Norfolk & Western has put out an inquiry for 33 tools and a number of miscellaneous equipment items. The Santa Fe and the Chicago, St. Paul, Minneapolis & Omaha also are taking bids on a few machines.

The Pullman Co. is reported to have closed for tools for its Buffalo plant. A leading can maker is expected to buy a liberal amount of machine tool equipment for its Cincinnati plant, which is engaged in the manufacture of can making machinery. The Westinghouse company's fourth quarter list is now out and some items already have been purchased.

The International Harvester Co. has bought $100,000 worth of reconditioned tools for installation in its Weber works at Chicago.

New York

NEW YORK, Oct. 15.—Machine tool buying in this district, which fell off somewhat in the two weeks preceding the National Machine Tool Exposition and in the week in which the exposition was taking place, revived considerably in the past week. Nearly all machine tool sellers who visited the exposition brought back a number of tentative orders and a fresh accumulation of prospects. If most of these promises of business mature, the machine tool industry will get a good volume of orders from this district during the next several weeks.

New York City Airport, Inc., care of Lawrence Halleran, Halleran Agency, 63 Broadway, Flushing, L. I., real estate, recently formed by Mr. Halleran and associates, has acquired 305 acre tract between Flushing and College Point, as site for airport, with facilities for seaplanes. Plans will be prepared at once for group of hangars to house more than 100 airplanes, machine and repair shop, service plant, oil storage building and other units, to cost more than $750,000 with equipment. Mr. Halleran will be president of new organization; Henry J. Dooley, vice-president; and E. E. Stapleton, treasurer.

Brooklyn Union Gas Co., 1721 Sheepshead Bay Road, Brooklyn, has plans for a two-story equipment repair, storage and distributing plant, including automobile service and repair shop for motor trucks, to cost over $200,000 with equipment. Bloch & Hesse, 18 East Forty-first Street, New York, are architects.

Topping Brothers, Inc., 159 Varick Street, New York, manufacturer of marine and other heavy hardware, has filed plans for addition to seven-story factory, including improvements in present structure, to cost about $300,000. Russell G. Cory, 30 Church Street, is architect and engineer.

Remington Automatic Quotation Board Co., New York, recently formed as a subsidiary of Remington Arms Co., 25 Broadway, has arranged for sale of stock issue to total $1,700,000, part of proceeds to be used for manufacturing. Company will specialize in production of automatic-operated stock exchange and other record boards. Manufacture will be carried out under direction of parent company, with main plant at Ilion, N. Y. Milton Reynolds is president.

T. F. Farrell, commissioner of canals and waterways, State Public Works Building, Broadway, Albany, N. Y., will receive bids until Nov. 1, for two hydraulic turbine units for use at Fort Edward, N. Y., with accessories, to cost $6,500,000.

J. S. Kennedy, 157 Remsen Street, Brooklyn, architect, has plans for eight-story automobile service, repair and garage building, 100 x 160 ft., to cost more than $300,000 with equipment.

Board of Trustees, New York Trade School, First Avenue and Sixty-seventh Street, New York, has awarded general contract to William Crawford, 7 East Forty-second Street, for two and one-half story addition, 200 x 225 ft., to cost $500,000 with equipment. William Miltenberger is architect for board.

American Can Co., 120 Broadway, New York, has approved plans for immediate erection of plant unit at Simcoe, Ont., where property recently was acquired, to cost more than $300,000 with equipment.

Western Electric Co., 195 Broadway, New York, manufacturer of telephone equipment, sound-producing mechanisms for motion pictures, etc., is disposing of stock issue to total $30,000,000, part of proceeds to be used for plant expansion.

New York Power & Light Corporation, 126 State Street, Albany, N. Y., a subsidiary of Mohawk-Hudson Power Corporation, same address, plans extensions in hydroelectric generating plant at Spier River Falls, on Hudson River, to cost over $1,000,000 with transmission lines.

Wallace & Tiernan Co., Inc., 11 Mill Street, Belleville, N. J., manufacturer of chlorine control equipment and parts, etc., has acquired local property for expansion. Present structure will be razed and plans drawn for new unit, to cost more than $75,000 with equipment.

Packard Motor Car Co., Broadway and Sixty-first Street, New York, and 198 Central Avenue, Newark, has superstructure under way for three-story service, repair and sales building, 183 x 200 ft., at 637-43 Central Avenue, to cost more than $400,000 with equipment. Present plant will be removed to new location. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Sonatron Tube Co., 57 State Street, Newark, manufacturer of radio tubes and equipment, has plans for a six-story addition, 70 x 120 ft., to cost over $100,000 with machinery. Siegler & Greenberg, 164 Market Street, are architects.

American Machinery Supply Corporation, care of Charles J. McPhillips, Liberty Trust Building, Philadelphia, president, has leased two-story factory at 49-55 Frelinghuysen Avenue, Newark, for local plant, part of unit to be used for storage and distribution.

Kolster Radio Corporation, 200 Mount Pleasant Avenue, Newark, manufacturer of radio equipment and parts, is arrang-

ing for increase in capital from 1,000,000 to 1,500,000 shares of stock, no par value, part of proceeds to be used for expansion. Company recently merged with Earl Radio Corporation, 122 East Forty-second Street, New York.

Radio Corporation of America, Inc., Woolworth, Building, New York, manufacturer of radio broadcasting equipment, etc., is said to be planning two-story and basement experimental plant at Bound Brook, N. J., to cost about $60,000 with equipment.

Cleveland

CLEVELAND, Oct. 14.—The machine tool market was dull the past week. The spurt of buying that was expected to follow the machine tool show in Cleveland has not yet materialized. However, it aroused a great deal of interest in the new equipment exhibited and in addition to a good volume of orders placed developed numerous prospects for business as well as definite inquiries that are still pending. These are expected to stimulate activity in the next few weeks. Among the most active prospects is the American Can Co., which is in the market for considerable machinery for its Cincinnati plant. The automotive industry is buying practically no machine tools at present and the dullness of the market is largely due to lack of activity in that field.

Ohio Seamless Tube Co., Shelby, Ohio, will complete its $400,000 plant extension program about Dec. 1. It is expected that new equipment will be in operation by first of year, increasing plant capacity about 40 per cent.

Newburgh Steel Co., 6318 Kinsman Road, Cleveland, will take bids for one and two-story addition to cost about $50,000 with equipment. George S. Rider Co., Marshall Building, is architect and engineer. Maurice Cohen is president.

Cleveland Railway Co., Hanna Building, Cleveland, has awarded general contract to A. A. Lane Construction Co., 1869 East Fifty-fifth Street, for new shops, one-story, 50 x 150 ft., including mechanical repair, forge and tool shops, to cost about $100,000 with equipment.

Middle States Airport Service, Inc., Akron, Ohio, care of C. W. Frank, Akron Savings & Loan Building, architect, has plans for hangar, with repair and reconditioning facilities, at Fulton field, to cost about $70,000 with equipment.

Truscon Steel Co., 6100 Hydraulic Avenue, Cleveland, Hydraulic Pressed Steel Division, is planning one-story addition, 75 x 290 ft., to cost over $60,000 with equipment. Headquarters are at Youngstown.

Willard Storage Battery Co., St. Clair Avenue and East 131st Street, Cleveland, has awarded general contract to H. M. Baruch, Los Angeles, for new plant at Montibello Park, near Los Angeles, to cost more than $400,000 with equipment. All machinery will be electrically operated.

Reliance Mfg. Co., Massillon, Ohio, manufacturer of lock nuts, washers, etc., has awarded general contract to A. F. Wendling Co., 11 Buckius Street, for one-story addition, to cost $45,000 with equipment.

Ohio Seamless Tube Co., Shelby, Ohio, has work under way on expansion to cost over $350,000.

The Crane Market

INQUIRY is improving for overhead traveling cranes and sellers expect some active buying in the next few weeks. Business in locomotive cranes has also shown improvement with a number pending for railroads and more interest in buying shown by the smaller contractors. Included in pending locomotive crane business are two Diesel engine-driven cranes for the Baltimore & Ohio Railroad, a 50-ton and 25-ton cranes for the New York Central Railroad and four crawl-tread cranes for the Amtorg Trading Corporation, New York.

In the Chicago district the Norfolk & Western Railroad will buy a 10-ton, 23-ft. 10½-in. span electric traveling crane, a 20-ton trolley, a 50-ton stationary drop table and eight 4000-lb., 22-ft. lift electric hoists.

Among recent purchases are:

Phoenix Utility Co., 71 Broadway, New York, 27½-ton, 71-ft. 6-in. span, 2-motor, power house crane from Whiting Corporation.

Stevens & Wood, engineers, New York, 10-ton, 31-ft. 6-in. span hand power crane from Whiting Corporation.

Consolidated Gas & Electric Co., Baltimore, small capacity locomotive crane, reported purchased from Koehring Co.

Electric Power & Maintenance Co., Monroe and Eleventh Streets, Toledo, Ohio, has plans for one-story service and repair works, to cost about $50,000 with equipment. Langdon, Hohly & Gramm, Security Building, are architects.

St. Louis

ST. LOUIS, Oct. 14.—Guardian Aircraft Corporation, 2504 Texas Street, St. Louis, manufacturer of airplanes and parts, has plans for one-story plant at Moberly, Mo., to cost over $40,000 with equipment. Ludwig Abt, Reigle Building, Moberly, is architect.

Mid-Continent Petroleum Corporation, 320 North Fourth Street, St. Louis, is considering new oil storage and distributing plant at Hannibal, Mo., to cost about $45,000 with equipment.

Moon Motor Car Co., 4400 North Main Street, St. Louis, is planning to diversify line of production and will use part of plant for manufacture of new automatically operated machine for agricultural service, including parts production and assembling. Company will carry out expansion, continuing production of automobiles, and has arranged for stock issue of 100,000 shares, no par value, to be used in part for such purpose.

Patterson Steel Co., 801 North Xanthus Street, Tulsa, Okla., has plans for storage and distributing plant, 100 x 150 ft., and 33 x 100 ft., to cost about $40,000 with equipment.

Swift & Co., Union Stock Yards, Chicago, have awarded a general contract to James T. Taylor, First National Bank Building, Fort Worth, Tex., for three-story plant at Ardmore, Okla., 76 x 130 ft., to cost about $150,000 with equipment.

Transcontinental Air Transport, Inc., Syndicate Trust Building, St. Louis, and Curtiss Flying Service, same address, with main offices at 27 West Fifty-seventh Street, New York, has asked bids for aircraft buildings at St. Louis air terminal, Highway No. 3, East St. Louis, Ill., including one-story motor torque building, 42 x 45 ft.; one-story repair and reconditioning shop, 120 x 213 ft.; and one-story shop, 50 x 101 ft., to cost over $75,000 with equipment. Kenneth Franzheim, 345 Madison Avenue, New York, is architect.

Davis Boring Tool Co., St. Louis, has been organized to take over and expand company of same name with local plant at 6200 Maple Avenue, manufacturer of special boring tools, reamers, cutters, etc.

Massey-Harris Harvester Co., Fairfax Industrial District, Kansas City, Kan., has awarded general contract to Lonsdale Brothers Construction Co., Bryant Building, for one-story addition to assembling plant, to cost over $40,000 with equipment. W. L. McLean is manager.

Buckley Aircraft Co., 148 North Fountain Street, Wichita, Kan., Roy D. Buckley, president, is considering new one-story plant near airport for parts production and assembling, to cost about $45,000 with equipment.

Missouri & North Arkansas Railway Co., Harrison, Ark., has acquired 7-acre tract adjoining engine shops at Kinsett, Ark., and plans construction of engine house, machine shops, sheds for passenger equipment and other structures, to cost more than $85,000 with equipment.

Evans-Wallower Zinc Co., East St. Louis, Ill., has plans for a lead plant, adjacent to its new electrolytic zinc plant, to cost $1,000,000. It will be operated as a part of present plant and will use virtually same process of manufacture.

Granite City Steel Co., Granite City, Ill., is completing a new machine shop, 150 x 300 ft., at a cost of about $250,000.

Hyman-Michaels Co., Railway Exchange building, St. Louis, has leased 20 acres of ground adjacent to its plant at Granite City, Ill., which will be used as a storage yard for relaying rails and for storage and repair of tank cars.

Buffalo

BUFFALO, Oct. 14.—Plans have been filed by McCauley Metal Products, Inc., 660 Grant Street, Buffalo, for extensions and improvements to cost about $30,000.

General Aviation Co., Syracuse, N. Y., operating an air service, plans removal of headquarters to Elmira, N. Y., where new hangar with repair and reconditioning facilities will be constructed. S. P. Voorhees is manager.

Firestone Tire & Rubber Co., Akron, Ohio, has taken out a permit to erect multi-story factory branch, storage and distributing plant at 1477 Main Street, Buffalo, to cost about $100,000 with equipment.

Hydraulic Transmission, Inc., Canandaigua, N. Y., care of C. W. Willis, 176 East Main Street, Webster, N. Y., recently formed by Maynard E. Estey, R. F. D., Canandaigua, and associates, with capital of $20,000, is said to be planning operation of local plant for production of hydraulic transmission machinery and parts.

Motor Transit Management Co., 1157 South Wabash Avenue, Chicago, has plans for one-story automobile service, repair and garage building at Syracuse, N. Y., to cost about $100,000 with equipment.

Dahlstrom Metallic Door Co., Buffalo Avenue and East Second Street, Jamestown, N. Y., manufacturer of fireproof doors, sash, elevator enclosures, etc., has

plans for two-story addition, including improvements in present plant, to cost about $40,000. Oliver Johnson, Fenton Building, is architect.

Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, is considering expansion at local plant in connection with removal of works of Thomas-Morse Co., Ithaca, N. Y., a subsidiary, to Buffalo, where production will be concentrated. Thomas-Morse Co. specializes in manufacture of all-metal single-motored planes open cockpit observation type, and will continue this line at Buffalo. Contract has recently been secured from Army Department for 70 units of this kind. Lawrence D. Bell is in charge of plant operations. Parent organization is completing plans for establishment of service and repair plants in different parts of country, initial units to be located in Canada and Southern California.

New England

BOSTON, Oct. 14.—Machine tool bookings the past week exceeded those for any week in some time. They included boring mills for 22 weeks' delivery, lathes for April delivery, a jig borer for 32 weeks' delivery, and shapers and milling machines, also for extended delivery. If dealers secure one-third of the business during the remainder of this month on which quotations have been made, October will make a record. Prospective business includes lots of one, two and three machines to the individual buyer and it is estimated that the total number involves nearly 500 tools.

Used tool dealers are having no difficulty in selling every conditioned lathe they can obtain. There is an active demand for shapers and milling machines, as well as horizontal boring mills. One local used tool house is maintaining a night and day force for reconditioning tools.

New England airplane and parts manufacturers continue to operate under pressure. Pratt & Whitney Aircraft Corporation, Hartford, has booked orders for 350 engines and parts having an approximate value of $2,355,000. This company has sufficient business on its books to maintain operations at capacity until June.

Small tool manufacturers in this territory state that 1929 will be the greatest year of production on record.

Lever Brothers Co., Cambridge, Mass., soap, has closed bids on a coal hopper. Purchase of conveying equipment is under consideration.

William E. Arnold Co., 17 Center Street, Malden, Mass., is building a one-story machine shop addition, to cost $30,000 without equipment.

Bay State Abrasive Products Co., Westboro, Mass., has started work on a one-story, plant, 80 x 100 ft. Some equipment is still to be purchased.

Terry Steam Turbine Co., Hartford, Conn., has plans for a one-story boiler plant, 50 x 50 ft. Bids for equipment will be taken later.

Franklin Foundry, West Glenwood Avenue, Hyde Park district, Boston, last week suffered considerable loss by fire.

United Aircraft & Transport Co., Inc., East Hartford, Conn., has awarded a contract for a power house, 50 x 120 ft.

Atlantic Wire Co., Church Street, Branford, Conn., has begun construction of one-story addition, 60 x 60 ft. Leo F. Caproni, 1056 Chapel Street, New Haven, Conn., is engineer, in charge.

Martin Trailer Co., Westfield, Mass., manufacturer of motor trailers and parts, plans new one-story factory, 80 x 100 ft., to cost about $45,000 with equipment.

New England Power Association, Worcester, Mass., has arranged an expansion program to cost about $60,000,000 over a 36 months' period, including construction of hydroelectric generating plant at Fifteen-Mile Falls, N. H., now in progress, representing an investment of $40,000,000, including steel tower transmission lines. About $15,000,000 will be expended for increased power and transmission facilities in Massachusetts, and $5,000,000 for similar work in Rhode Island for its subsidiary, Narragansett Electric Co., Providence. Frank D. Comerford is president of parent organization.

Cochrane Chevrolet Co., Main Street, Bridgeport, Conn., local representative for Chevrolet automobile, has plans for three-story addition to service, repair and sales building, to cost about $100,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, is architect and engineer.

Strathmore Paper Co., Mittineague, Mass., has plans for addition to mill at West Springfield, Mass., to cost about $140,000 with equipment.

Westfield Mfg. Co., Westfield, Mass., manufacturer of bicycles, children's vehicles, parts, etc., has arranged for a stock issue to total $1,642,000, part of proceeds to be used for expansion.

Sikorsky Aircraft Co., Lordship, Bridgeport, Conn., has plans for one and two-story addition, 200 x 250 ft., to cost over $90,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, is architect and engineer.

F. S. Payne Co., Radcliffe Avenue, Cambridge, Mass., manufacturer of electric power and hydraulic elevators, parts, etc., has awarded general contract to Walsh Brothers, 150 Hampshire Street, for two-story machine shop addition, 50 x 110 ft., to cost about $45,000 with equipment.

Philadelphia

PHILADELPHIA, Oct. 14.—Contract has been let by United Motors Service, Inc., 342 North Broad Street, Philadelphia, an interest of General Motors Corporation, to Golder Construction Co., Insurance Co. of North America Building, for two-story service, repair and sales building, to cost $150,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Board of Education, Nineteenth and Ludlow Streets, Philadelphia, is considering installation of manual training equipment in new four-story junior high school to cost $1,200,000, for which bids are being asked on general contract until Nov. 5. Irwin T. Catharine is architect for board.

Monroe Calculating Machine Co., Inc., 2020 Market Street, Philadelphia, manufacturer of computing machines and parts, with main plant at Orange, N. J., has leased building at 2039 Arch Street, for new local factory branch and distributing plant.

Board of City Commissioners, Ocean City, N. J., has authorized purchase of 130-acre tract on Bay Avenue, as site for municipal airport, and will have plans drawn in near future for hangars, repair and reconditioning shop, oil storage and other field units, to cost more than $85,000.

National Casket Co., 60 Massachusetts Avenue, Boston, has plans for three-story factory branch and distributing plant at Scranton, Pa., to cost over $75,000 with equipment. John H. Weida, 1425 Dickson Avenue, Scranton, is architect.

William J. Kuntz, 544 East Boundary Avenue, York, Pa., and associates have organized Lime & Hydrate Plants Co., to operate a local plant to manufacture equipment for lime production, mechanical dryers, and other products. Samuel LeRoy Jacobs, York, is also interested in new company.

Safe-Guard Check Writer Corporation, 5 Beekman Street, New York, with plant at Lansdale, Pa., has purchased plant and business of Repeater Stamp & Duplicator Corporation, 114 East Thirty-second Street, New York, manufacturer of patented devices for reproduction purposes. Purchasing company will remove New York factory to Lansdale, where increased facilities will be provided. Company recently acquired Hercules Check Certifier Co., manufacturer of check protecting machines and parts, and will develop capacity for this product at Lansdale plant.

W. P. Paul Co., Drexel Building, Philadelphia, manufacturer of forgings, etc., plans rebuilding part of machine shop at 1013 North Front Street, recently damaged by fire.

Chicago

CHICAGO, Oct. 14.—A good sized list of machine tools and mechanical equipment for the Norfolk & Western, several small lot inquiries by Western railroads and more active work on 1930 budgets are reviving interest in railroad buying. The Santa Fe will purchase two shears and and a floor grinder and the Chicago, St. Paul, Minneapolis & Omaha is in the market for an 18 x 3-in. double floor grinder and a 24-in. upright drill press.

Demand for used tools is unabated. The International Harvester Co. has recently closed for $100,000 worth of reconditioned tools which are being placed in the Weber works, Chicago. Fresh inquiries this week have added little to the pending list, which is impressive. New sales were widely scattered and in no larger volume than in the first week of October. Bids are being tabulated on the list issued for a buyer in the Orient. It is reported that the Pullman Co.'s Buffalo list has been closed.

Norfolk & Western List:

One 30 x 36-in. jarring machine.
Two journal truing and axle turning lathes.
One 24-in. x 8-ft. engine lathe.
One 48-in. x 10-ft. gap lathe.
One 90-in. driving wheel lathe.
One heavy-duty turret lathe.
Twenty-eight locomotive blowers, with apron, for 24-in. diameter stacks.
Two 36 x 36-in. x 36-in. x 12-ft. planers.
Two 250 gal. per min. centrifugal pumps, 345-ft. head, water temp. 200 deg. Fahr.
One 600 gal. per min. portable gas-engine driven centrifugal pump.
One four-cylinder single-acting pump, 25 gal. per min., 1500 lb. head.
Three 500-cu. ft. per min. cross-compound compressors, synchronous motor drive.
Five automatic feed water regulators.
Two 400-hp. boilers, 125-lb. pressure.
One 364-hp. boiler, 125-lb. pressure.

One 10-ton crane, 23-ft. 10½-in. span.
One 20-ton trolley crane.
One Whiting 50-ton drop table.
Two 16-in. drill presses.
One 6-ft. radial drill.
Five 18 x 3-in. double-floor grinders.
One internal grinder.
One 7 x 1-in. floor grinder.
One bevel gear cutter.
Eight 4000-lb., 22-ft. lift, electric hoists.
Two drop hammers.
One 8000-lb. steam hammer.
One ¼ to 2-in. pipe cutter.
One 50-ton forcing press.
One 750-ton hydraulic press.
One 36-in. crank shaper.
One 32-in. crank shaper
One pneumatic flanging press, ¾-in., 100 lb. pressure.
One dumping platform electric truck.
One 2½-ton auto truck.
One 1-in. bolt-heading machine.
One car-type core oven 8½ x 17½ ft., 11½ ft. high.
One 15-in. portable disk grinder.
Eight stationary tilting-type brass melting furnaces, 300 lb. per heat.
Miscellaneous list of motors and starters for machine drives, also transformers.

Continental Air Service, Municipal Airport, Chicago, will build a one and two-story hangar, 90 x 120 ft. R. V. Murison, Fisher Building, is architect.

Western Electric Co. has leased three-story building containing about 98,000 sq. ft. of floor area at 620 South Kilbourn Avenue, Chicago, for light manufacturing.

Eaton Metal Products Co., manufacturer of steel tanks, culverts and other metal products, with factories at Omaha, Neb., and Denver, has broken ground for a branch plant at Billings, Mont.

Reed & Prince Mfg. Co., Worcester, Mass., manufacturer of screws, rivets, burrs, nuts and bolts, has purchased 18,000 sq. ft. and a two-story building at 3635 Iron Street, Chicago, and will remove its present office and warehouse at 121 North Jefferson Street to new location.

Marvin Radio Tube Corporation, 1603 South Michigan Avenue, Chicago, has plans for enlargements, including installation of additional equipment, to cost more than $75,000.

Douglas Iron Works, Inc., 1128 South Fairfield Avenue, Chicago, is taking bids on general contract for a one-story plant unit, to cost about $100,000 with equipment. Structure will be used in part for ornamental iron work.

Minneapolis Gas Light Co., 16 South Seventh Street, Minneapolis, Minn., has plans for one-story equipment storage and distributing plant, with mechanical shops, etc., 80 x 200 ft., to cost about $130,000 with equipment.

Cities Service Oil Co., 1745 University Avenue, St. Paul, Minn., is considering one and two-story storage and distributing plant, to cost $100,000 with equipment.

American Steel & Wire Co., 208 South La Salle Street, Chicago, has plans for immediate erection of one-story unit, 80 x 800 ft., at Waukegan plant, primarily for wire drawing, increasing that division by about 25 per cent, estimated to cost $800,000 with equipment.

Atchison, Topeka & Santa Fe Railway Co., Topeka, Kan., and 80 East Jackson Boulevard, Chicago, has awarded general contract to W. A. Smith & Son, Fort Madison, Iowa, for addition to engine house, with shop facilities, at Shopton, Iowa, to cost more than $65,000 with equipment. E. A. Harrison is company architect.

Insulite Co., International Falls, Minn., manufacturer of insulating board products, is planning an expansion at local mill to double present output, to cost more than $100,000 with equipment. Company is a subsidiary of Backus-Brooks Co., Minneapolis.

Binks Mfg. Co., 3114-26 Carroll Avenue, Chicago, manufacturer of spraying equipment and devices, has purchased adjoining factory and will remodel for expansion. Present occupant, Hafner Mfg. Co., manufacturer of mechanical toy railroads and kindred products, will remove to a new plant on Kolmer Avenue, one-story, 100 x 300 ft., to cost about $85,000 with equipment, for which superstructure will soon begin. Austin Co., is engineer and contractor for last noted structure.

Hayes-Custer Stove Co., Empire Street, Bloomington, Ill., is considering one-story foundry addition, to cost more than $30,000 with equipment.

South Atlantic

BALTIMORE, Oct. 14.—Contract has been let by Union Tank Car Co., Fourteenth Street and Fourth Avenue, Baltimore, to Austin Co., Philadelphia, for one-story plant unit, to cost about $40,000 with equipment.

Gulf Refining Co., Frick Annex, Pittsburgh, has acquired waterfront property at Baltimore, vicinity of Frankfurst and Childs Streets, and plans construction of oil storage and distributing plant, with steel tanks and facilities for initial capacity of about 500,000 bbl. Project will include main unit, 150 x 350 ft., and motor truck service, repair and garage building, 75 x 116 ft. Pier, 40 ft. wide and 720 ft. long, will be built, to be provided with conveying, loading and other handling equipment.

Kreider-Reisner Aircraft Co., Inc., Pennsylvania Avenue, Hagerstown, Md., has plans for one-story addition, with two-story section, totaling about 7200 sq. ft. floor space, for expansion in airplane assembling and parts production, to cost about $50,000 with equipment. Company will also build a hangar, 60 x 80 ft., at local airport, with shop and repair facilities. H. Henry Reisner is head.

Southern Building Products Corporation, Savannah Fire Insurance Building, Savannah, Ga., recently formed as a subsidiary of Certain-teed Products Corporation, 100 East Forty-second Street, New York, to manufacture roofing and kindred building products, has awarded general contract to Artley Co., 504 East Bay Street, Savannah, for new local plant, including boiler house, machine shop and auxiliary structures, with storage and distributing facilities, to cost more than $400,000 with equipment. W. G. Will is company engineer in charge.

Nachman-Springfilled Co., 2241 South Halsted Street, Chicago, manufacturer of upholstery and mattress springs, etc., has arranged for establishment of branch plant at Norfolk, Va.

Valliant Fertilizer Co., Marine Bank Building, Baltimore, is considering new two-story commercial fertilizer manufacturing plant at Pocomoke, Md., to cost about $50,000 with equipment.

Keystone Water Works & Electric Corporation, Wilson, N. C., operating electric light and power utilities, ice plants and waterworks in North Carolina, Ohio, West Virginia, Kentucky, Georgia and other States, has disposed of a stock issue totaling $1,300,000, part of proceeds to be used for expansion.

City Council, Rome, Ga., has appointed special committee, headed by Hugh McCarty, to complete plans for a municipal electric light and power plant, to cost over $250,000 with equipment.

Leroi Patent Cup Co., Savannah, Ga., manufacturer of turpentine containers and kindred products for naval stores, is planning one-story addition, to cost about $25,000 with equipment.

Chesapeake & Ohio Railroad Co., Richmond, Va., has work under way on expansion at local engine terminal and shops, including new engine house, with machine, boiler-washing and other shop units, to cost about $800,000 with equipment, including similar expansion at Fulton, now in progress.

Cincinnati

CINCINNATI, Oct. 14.—Although inquiry continues good, the slowness of buyers to close after receiving quotations has caused a slight recession in the volume of new orders in this district. While business in September was good, the total was less than that of August, although slightly ahead of September last year. Fresh bookings the past week were about equal to the preceding week and were mostly for one or two machines. A Chicago buyer is inquiring for several small planers.

The Niagara Machine & Tool Works placed an order with a local manufacturer for one large planer, and the Hamilton Manufacturing Co., Two Rivers, Wis., bought one medium sized planer. An Eastern buyer purchased four 16-in. lathes from a local builder.

Contract for construction of first unit of plant for Crosley Aviation Co. was awarded last week to Austin Co., Cleveland. Building will be one story, 100 x 120 ft.

Exact Weight Scale Co., 265 West Spring Street, Columbus, Ohio, has awarded general contract to E. Elford & Sons, Inc., Columbus, for one-story plant, totaling 35,000 sq. ft. floor space, to cost $100,000 with machinery. Carmichael & Milspaugh, 8 East Long Street, are architects.

Board of Education, Jackson, Ohio, is said to be planning installation of manual training equipment in new three-story high school to cost about $240,000, for which plans are being drawn by Granville Scott, Citizens' Bank Building, Norwalk, Ohio, architect.

Southern Ohio Electric Co., Athens, Ohio, is disposing of bond issue to total $2,487,000, part of proceeds to be used for expansion and improvements in power plants and system. Company is closing negotiations for purchase of plant and property of Chillicothe Electric Railroad, Light & Power Co., Chillicothe, Ohio, and will consolidate; extensions and betterments will be carried out, including transmission line construction.

Knoxville Power & Light Co., Knoxville, Tenn., has awarded a general contract to Gervin Construction Co., 215 North Broadway, for one-story brass foundry and forge shop, to cost about $35,000 with equipment.

Federal Tile Co., North High Street, Columbus, Ohio, manufacturer of roofing tile, etc., has acquired local property as site for new three-story plant, to cost about $100,000 with equipment.

Delco Products Co., 329 East First Street, Dayton, Ohio, manufacturer of isolated electric lighting plants, lighting and starting equipment for automobiles,

etc., has plans for new seven-story unit, to cost about $200,000 with equipment.

Tennessee-Eastman Corporation, Kingsport, Tenn., subsidiary of Eastman Kodak Co., Rochester, N. Y., has approved construction of steam-operated electric power plant at local chemical works, 52 x 100 ft., to cost over $85,000 with equipment. Baker & Spencer, 17 Battery Place, New York, are engineers.

Detroit

DETROIT, Oct. 14.—Wolverine Bolt Co., 9660 French Road, Detroit, manufacturer of bolts, nuts, studs, etc., has awarded general contract to Henry W. Heide, 1243 Rademacker Avenue, for one-story plant unit, to cost about $70,000 with equipment. Mildner & Eisen, Hamm Building, are architects.

Beck, Koller & Co., General Motors Building, Detroit, manufacturer of mechanical equipment, has awarded general contract to Austin Co. for one-story machine shop at Hamtramck, Mich., to cost about $40,000 with equipment.

AC Spark Plug Co., Flint, is planning three-story addition, 100 x 160 ft., to cost about $100,000 with equipment. Several departments, including testing division and laboratories will be removed to new unit and additional equipment provided. Space vacated will be used to manufacture an electric gasoline gage, recently perfected by company. Harlow H. Curtice is vice-president and assistant general manager.

Motor Wheel Corporation, Saginaw Street, Lansing, manufacturer of wire and steel disk automobile wheels, has asked bids on general contract for four-story addition, to cost about $200,000 including equipment.

Interests identified with Detroit Edison Co., 2000 Second Avenue, Detroit, have organized Electro-Master, Inc., to take over and operate electric range manufacturing division of utility company, known as Electrochef, including local plant unit. New company will have assets of about $1,000,000 and will increase production facilities. Warren Noble is president; and Richard B. Marshall, vice-president and general manager.

Ford Motor Co., Detroit, has superstructure under way on new units at aircraft plant at Fort Dearborn, Mich., for production of one all-metal tri-motor airplane per day. It is proposed to remove small parts and forging departments from River Rouge plant to Fort Dearborn as soon as new units are ready.

Page Steel & Wire Co., Adrian, will carry out expansion, including installation of additional machinery for new department for production of a front wheel brake cable for Chevrolet Motor Co., Flint, to cost close to $75,000.

Hayes Body Corporation, Seventh Street, N. W., Grand Rapids, has asked bids on general contract for one-story metal press shop, 175 x 565 ft., to cost about $250,000 with equipment. Fett, Pearson & Goffeney, Associates Building, South Bend, are architects.

Evans Auto Loading Co., Union Trust Building, Detroit, manufacturer of automobile loading decks and equipment, and other loading devices, has disposed of a bond issue of $900,000, part of proceeds to be used for expansion.

Chrysler Corporation, 12200 East Jefferson Street, Detroit, has awarded general contract to W. E. Wood Co., Union Trust Building, for one-story machine shop, 160 x 160 ft., to cost about $85,000 with equipment.

Commerce Pattern Foundry & Machine Co., Grand River Avenue, Detroit, is building an addition to manufacture machine tools, to cost $30,000. Contract for design and construction has been awarded to Austin Co., Cleveland.

Acorn Nut Co., Flint, Mich., has been incorporated with capital of $250,000 to manufacture metal nuts, particularly those used by automobile industry. A new plant erected at Flint is now operating with a daily capacity of 120,000 acorn nuts.

Pittsburgh

PITTSBURGH, Oct. 14.—Machine tool business has been active the past week from both the standpoint of orders and new inquiries. Many local dealers will benefit by orders booked at the machine tool show, while others are now actively engaged in following up leads. The fourth quarter list of the Westinghouse Electric & Mfg. Co. is now out and orders for some of the tools will begin to be placed immediately. The Norfolk & Western has also issued a list, but it is the only railroad which has yet brought out an inquiry of importance. Nevertheless, local dealers look to the railroads for rather heavy purchases in the next three months.

Orders are being placed regularly for equipment for the last steel plant expansion in this district and heavy machinery makers and crane builders are busier than they have been for a long time. Purchases are being made regularly for the McKeesport plant of the National Tube Co., and other Steel Corporation subsidiaries, notably the American Sheet & Tin Plate Co., have been large buyers.

Babcock & Wilcox Tube Co., Farmers' Bank Building, Pittsburgh, an interest of Babcock & Wilcox Co., same address, manufacturer of watertube boilers, etc., headquarters at 85 Liberty Street, New York, has approved an expansion program at Beaver Falls, Pa., to double, approximately, present capacity, to cost more than $400,000.

Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, has work under way on new sheet glass plant at Crystal City, Mo., to cost more than $500,000 with machinery. Company is also building new sheet glass mill at Henryetta, Okla., to cost over $1,000,000 with equipment. Work is in progress on extensions in plant at Mount Vernon, Ohio.

Carbide & Carbon Chemical Corporation, 30 East Forty-second Street, New York, has awarded contract to Kinstrey Co., South Charleston, W. Va., for new plant at that place for production of synthetic alcohol and allied products, consisting of four main units, to cost more than $1,500,000 with machinery.

International Nickel Co., 67 Wall Street, New York, has awarded general contract to Hatfield Construction Co., Fourteenth Street, Huntington, W. Va., for two one-story additions to Huntington mill. Main unit will be 158 x 400 ft., and will be occupied by American Mond Nickel Co., Clearfield, Pa., a recently acquired subsidiary, which will be removed to Huntington and capacity increased for production of cold drawn nickel specialties. Project will cost more than $350,000.

Milwaukee

MILWAUKEE, Oct. 14.—Renewed activity in the machine tool trade indicates fall volume comparable with any during the summer. Much pending business is being closed following the Cleveland show. Some manufacturers of electrical machinery, construction equipment, cranes, tractors and agricultural implements are contemplating expansion, but few of the plans are as yet out of the hands of the draftsmen. Activity in the pattern shops is beginning to be followed by increased production in the foundries.

Quantity production is being slowly resumed in local automobile factories and changed models have necessitated purchase of considerable special equipment. The delivery situation has not improved.

Yates-American Machine Co., Beloit, Wis., has authorized purchase of $250,000 for expansion and modernization of plants at Beloit, Rochester, N. Y., and Hamilton, Ont.

Universal Tool & Die Co., 128 Ferry Street, Milwaukee, is completing new two-story plant, 75 x 150 ft., to cost $50,000.

Pittsburgh Plate Glass Co., paint and varnish division, 205 Pittsburgh Avenue, Milwaukee, has announced $2,000,000 enlargement program for its paint, varnish and lacquer plants at Milwaukee, construction to begin next spring. Ludington Patton is resident vice-president in charge.

Hamilton Mfg. Co., Two Rivers, Wis., manufacturer of dentists' equipment and wood and steel printers' furniture, has let contracts for two-story addition, 65 x 178 ft., to cost about $75,000. W. Frank Dolke, Jr., Chicago, is consulting engineer, and T. W. Suttard, secretary, is in charge.

Barnes-Ames Co., 201 Board of Trade Building, Duluth, Minn., will build new grain elevator at Superior, Wis., next spring to cost about $1,500,000. Arthur P. Barnes is secretary.

Northern Conveyor & Mfg. Co., Janesville, Wis., through the completion of a plant addition, 160 x 200 ft., has doubled its capacity. Additional land has been bought for future extensions to present plant area of 64,000 sq. ft.

Gulf States

BIRMINGHAM, Oct. 14.—Hughes Tool Co., 300 Hughes Street, Houston, Tex., manufacturer of oil well tools and equipment, has plans for one-story addition, 35 x 180 ft., to cost about $50,000 with equipment.

Acme Machine Co., Galveston, Tex., is planning to rebuild part of plant destroyed by fire Oct. 6.

City Council, Shreveport, La., has engaged J. N. Chester, Clark Building, Pittsburgh, engineer, to prepare plans for new municipal pumping plant at Cross Lake, to cost $425,000 with machinery.

Board of Education, Texarkana, Tex., is considering installation of manual training equipment in new high school to cost $150,000, for which plans will be drawn by Witt, Seibert & Halsey, Texarkana, architects.

Atlas Metal Works, Inc., 2601 Alamo Street, Dallas, Tex., has awarded general contract to Austin Brothers, 1815 Coombs Street, for one-story plant unit at West

Dallas, 200 x 210 ft., to cost about $100,000 with equipment.

City Council, Fort Worth, Tex., has plans for new units at municipal airport, including hangar, 80 x 100 ft., with repair and reconditioning facilities, two-story administration building, 45 x 100 ft., and other structures. Fund of $500,000 recently was voted for airport and buildings. C. M. Thelin is city engineer in charge.

Pasotex Petroleum Co., Womble Boulevard, El Paso, Tex., is considering expansion at local oil refinery to increase capacity close to 2000 bbl. daily, developing total output of 5500 bbl. per day; new storage and distributing units will be built. Entire program will cost about $1,000,000 with equipment.

Board of Education, El Paso, Tex., is considering installation of manual training equipment in new two-story high school to cost about $350,000, for which plans are being drawn by Guy L. Frazer, Martin Building, architect; Braunton & McGhee, First National Bank Building, are associate architects.

Sugar By-Products Corporation, 7407 Bordeaux Street, New Orleans, R. E. Blouin, president, has arranged financing to an amount of about $500,000, considerable part of fund to be used for construction of alcohol distilling plant, including by-products factory for production of potash specialties, acids, etc.

City Council, Tampa, Fla., is planning new municipal airport at Ballast Point, Hillsborough Bay district, to cost about $700,000 with hangars, repair and reconditioning shops, oil storage and other units. An additional fund of $50,000 is proposed for improvements at present airport. Special election has been called on Nov. 16 to approve bonds for $750,000.

Central Power & Light Co., San Antonio, Tex., plans extension and improvements in steam-operated electric power plant at Presidio, Tex., including installation of new engine unit and other machinery, to cost over $100,000.

Indiana

INDIANAPOLIS, Oct. 14.—Bendix Aviation Corporation, South Bend, manufacturer of airplane accessories and equipment, a subsidiary of Bendix Corporation, has awarded general contract to H. G. Christman & Co., 306 South Notre Dame Avenue, for one-story addition, 360 x 1000 ft., to cost about $450,000 with equipment.

Blackford Window Glass Co., 537 Willow Street, Vincennes, is considering new unit for production of sheet glass, to cost about $100,000 with equipment. Frank J. Bastin is president.

Indiana Consumers Gas & By-Products Co., Terre Haute, operating by-product gas plants and system, has disposed of a preferred stock issue to total $2,000,000, part of fund to be used for extensions, including construction of new high pressure gas lines, about 78 miles, and increased distributing facilities.

Board of School Commissioners, 150 North Meridian Street, Indianapolis, is considering installation of manual training equipment in three-story and basement Irvington High School, to cost about $750,000, for which bids will soon be asked on general contract. McGuire & Shook, 941 North Meridian Street, are architects.

Time-O-Stat Controls Co., Elkhart, manufacturer of electrically-operated control devices and equipment, has awarded general contract to George C. Kistner Co., 514 South Main Street, for one-story plant unit, to cost about $25,000 with equipment.

D-A Lubricant Co., Twenty-ninth Street and Canal, Indianapolis, has awarded general contract to Brown & Mick, Inc., 1020 East Michigan Street, for two-story and basement oil storage and distributing plant, to cost about $38,000 with equipment.

American Metal Furniture Co., Indianapolis, has awarded contract for erection of a new factory, 150 x 200 ft. Company specializes in furniture for physicians' and dentists' offices.

Peerless Wire Goods Co., Lafayette, manufacturer of wire baskets, bakers' equipment and other products, will erect a new plant, consisting of group of buildings, which will provide 65,000 additional feet of floor space.

Pacific Coast

SAN FRANCISCO, Oct. 10.—Alco Oil Tool Co., Compton, Cal., has awarded general contract to A. R. Eaton, 526 Burton Avenue, for one-story addition, 60 x 350 ft., to cost about $60,000 with equipment.

Fokker Aircraft Co., Glendale, W. Va., has awarded general contract to Eaves Construction Co., 1524 LaBaig Street, Los Angeles, for new airplane manufacturing plant near El Monte, Cal., adjoining airport of Western Air Express, to cost about $300,000 with equipment. Works will include units for parts production and assembling.

Las Vegas High School District, Las Vegas, Nev., plans manual training shop at new high school group to cost $250,000, for which plans are being completed by George Ferris & Son, Reno, Nev., architects.

Imperial Valley Irrigation District, El Centro, Cal., is considering installation of steam-operated electric generating plant with capacity of 6000 kw., using Diesel engine units, instead of group of hydroelectric generating plants, in accordance with recommendations made by Edward Hyatt, State engineer, to cost more than $100,000 with equipment.

State Board of Harbor Commissioners, San Francisco, has plans for extensions and improvements in cold storage and refrigerating plant at Pier 43, to cost about $250,000 with equipment. Frank White, Ferry Building, is engineer.

Olympic Forest Products Co., Port Angeles, Wash., has awarded general contract to Christopher Kuppler, Port Angeles, for two one-story units for local pulp mill, 150 x 370 ft., and 60 x 257 ft., latter to be used in part as a machine works, to cost more than $1,000,000 with equipment. J. H. Bloedel and Joseph Irving head company.

Puget Sound Power & Light Co., Seattle, has arranged for a bond issue of $8,000,000, part of proceeds to be used for expansion in power plants and system. Company is planning for hydroelectric generating plant on Skyhomish River, near Everett, Wash., to cost more than $1,500,000. It is operated by Stone & Webster, Inc., Boston.

Huntington Park Union High School District, Huntington Park, Cal., is considering installation of manual training equipment in new high school at South Gate, to cost $300,000, for which bids will soon be asked on general contract. George M. Lindsey and Erwood P. Eiden, Insurance Exchange Building, Los Angeles, are architects.

Oliver United Filters Co., Fourth and Madison Streets, Oakland, Cal., manufacturer of filtering machinery, parts, etc., is considering new plant in Fruitvale district, to cost over $75,000 with equipment.

McLennan, McFeely & Prior, Ltd., Vancouver, B. C., iron and steel merchant and hardware jobber, has purchased Anderson & Lusby, New Westminster, B. C., and will operate the latter under the name of Anderson & Lusby, Ltd., with L. B. Lusby as director and manager. McLennan, McFeely and Prior, Ltd., was created in June, 1928, through a consolidation of McLennan, McFeely & Co. and E. G. Prior & Co., Victoria, B. C.

Canada

TORONTO, Oct. 14.—Current demand for machine tools is well up to the average for the year, with inquiries in good volume. Railroads are buying for shop replacements and considerable business is pending for plants under construction. The automotive industry is a regular customer and while most of the orders are for one or two tools, total sales show a good average each week. The manufacturing industry as a whole is maintaining a steady demand for machine tools.

Bancroft Light & Power Co., Bancroft, Ont., has plans for construction of a power plant to cost $40,000. Work will be started next spring.

Electric Auto Light Corporation, Toledo, Ohio, has let general contract to Thomas Grace, 291 Christina Street South, Sarnia, Ont., for a one-story plant at Point Edward, Ont.

Thompson Products Co., 2196 Clarkwood Road, Cleveland, will build a manufacturing plant at St. Catharines, Ont., bids to be called Nov. 15. Roberts-Wright Co., Swetland Building, Cleveland, is engineer.

Canadian Metal Window & Steel Products Co., Ltd., 160 River Street, Toronto, has awarded contract to Walter Davidson & Co., 188 Duke Street, for an addition.

St. John Iron Works, Vulcan Street, St. John, N. B., has awarded contract to George Lawson, 51 Wright Street, for a foundry to cost $20,000.

Dominion Coal Co., a subsidiary of British Empire Steel Corporation, has awarded contract to United Engineers & Constructors, Ltd., Montreal, for design and construction of a steam power plant at Glace Bay, N. S.

E. B. Eddy Co., Hull, Que., will build a $1,500,000 paper mill on its property. A survey has been made and plans are being prepared by company's architect, M. Pratt.

Royal Securities Corporation, 244 St. James Street, Montreal, has awarded contract to Morrow & Beatty, Ltd., Peterborough, Ont., for construction of a power development plant at Chats Falls, Que., to cost $2,500,000.

Foreign

PROPERTY at La Plata, Argentina, has been acquired by Goodyear Tire & Rubber Co., Akron, Ohio, as site for new plant to manufacture automobile tires and tubes, to cost more than $3,000,000 with equipment.

Compania Mexicana de Gas, Monterey, Mexico, a subsidiary of Moody-Seagraves Co., Fort Worth, Tex., has begun construction of pipe line from Jennings gas field, Zapata County, Tex., to Monterey, by way of Roma, Tex., about 142 miles, for natural gas supply at Monterey and vicinity, to cost more than $400,000 with booster stations and operating facilities.

American & Foreign Power Co., 2 Rector Street, New York, operated by Electric Bond & Share Co., same address, has concluded arrangements with Minas Geraes State Government, Brazil, to take over and operate electric light, power and traction properties at Belle Horizonte, capital of State. Acquiring company plans expansion and improvements, to cost more than $1,000,000 with equipment; property will be operated in conjunction with other utilities now controlled in that district. American & Foreign Power Co. has also secured a 50 per cent interest in Tata Sons, Ltd., Bombay, India, operating Tata Hydroelectric Agencies, Ltd., furnishing electric light and power at Bombay and vicinity, and will be active in management; expansion is proposed.

Seiberling Rubber Co., Akron, Ohio, manufacturer of automobile tires and other rubber goods, is planning for early establishment of new plant in Germany to manufacture tires and tubes. Entire project is reported to cost about $500,000 with equipment.

Real del Monte Mining Co., Pachuca, State of Hidalgo, Mexico, has plans for extensions and improvements in local gold and silver milling plants and properties, to include new buildings and machinery, to cost about $1,750,000.

New Trade Publications

Triple-Service Boilers.—International Boiler Works Co., East Stroudsburg, Pa. Circulars illustrating and describing a water-tube boiler for domestic use which has within its shell arrangements for heating a house by steam or hot water through the use of gas or oil as fuel, a domestic hot water heater and a garbage incinerator. This boiler is made in 21 sizes ranging from 500 to 12,000 sq. ft. of steam radiation.

Steel Shelving.—General Fireproofing Co., Youngstown, Ohio. A catalog has been issued illustrating over 2000 different combinations of steel shelving which are designated as standard units. The listing of these units, with the price sheet accompanying the catalog, simplifies the matter of selecting and ordering steel shelving.

Firebond High-Temperature Cement.—Harbison-Walker Refractories Co., Pittsburgh. An elaborate booklet of 12 pages tells in pictures and words how the use of Firebond will reduce furnace maintenance costs by prolonging the life of refractory linings. Tables for calculating the quantities of brick required for arches of different spans and thicknesses are published.

Flexible Couplings.—Poole Engineering & Machine Co., Baltimore. Advantages of using Poole flexible couplings are set forth in a 36-page illustrated hand book. Many typical installations are described.

Squirrel Cage Induction Motors.—Century Electric Co., St. Louis. Bulletin No. 6-1 describes type SCN squirrel cage induction polyphase motors.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

WAR between nations is banished by Kellogg treaty, consequently old problems can be approached "from a new angle and in a new atmosphere," to quote the statement issued by President Hoover and Premier MacDonald. Addressing the Senate, the latter said that war is "impossible if you and we do our duty" and endorsed naval parity without reserve.

* * * * *

RADIO successfully broadcast Premier MacDonald's speeches to listeners in England . . . Radio telephone connection has been made between New York and Australia, 15,000 miles. . . . Communications between Spain and South America are much improved by new wire lines between Chile and Uruguay, across the Andes, pampas and Rio Platte, and a beam wireless to Seville, 6,000 miles away.

* * * * *

SHIPMENTS from Winnipeg to England via the Hudson Bay railroad have been commenced by the Hudson Bay Co., which in 1668 started to trade over this route . . . The largest American-built passenger ship, the Pennsylvania, of 33,000 tons, has been built at Newport News and delivered within one year; it will ply between Atlantic and Pacific ports . . . Rolling stock and auxiliary equipment for New York subways costing $20,146,000 will be purchased.

* * * * *

AIRPLANES weighing 50 to 100 tons, to carry 200 persons in regular 36-hr. trans-Atlantic flight, are expected in the near future by Igor Sikorsky . . . French aviators Coste and Bellonte fly 6,160 miles, a record distance, Le Bourget to Manchuria . . . The huge British dirigible R-101 passes preliminary tests and is visited by a million sight-seers.

* * * * *

TRAFFIC on the Philadelphia-Camden bridge has in three years reached the capacity of its approaches; it is carrying about a million automobiles a month, and will pay for itself by 1940, six years ahead of the expected time . . . Purchase of foreign plants by General Motors, said President A. P. Sloan, is not to stifle competition but to provide plants for manufacturing a European car for European markets . . . He expects a steady annual consumption of 5,000,000 cars in America, but executives of Willys-Overland and Reo believe the 1930 production must be kept to 1929 figures to avoid saturation of market.

* * * * *

BUSINESS men are generally optimistic over trade conditions, which compare well with the corresponding period last year, even though the large margins of advance made earlier in 1929 have not been maintained. Wholesale trade, jobbing, retail trade and car loadings show that consumption of goods is pursuing a normal and steady course . . . Sales of life insurance, said to form a new barometer of prosperity, are considerably higher than a year ago . . . Each of the trans-Mississippi "corn and cow States" shows a material decrease in farm mortgage indebtedness since 1925 . . . Pacific coast industrial employment and activity are making records.

* * * * *

CALL money dropped to 5 per cent, the lowest for over a year, and collateral time loans also declined nearly 1 per cent. Easy money is said to be due to closing out of many speculative accounts during the recent stock market slump . . . Sterling crossed par for the first time in 14 months, and gold exports from England abruptly stopped . . . Committees, meeting at Baden-Baden to formulate rules of conduct for World Bank, consider whether the bank should be limited to the duty of handling German reparations, or permitted to serve as an international clearing house to stabilize national currencies and prevent industrial panics . . . Americans subscribed to a third of a billion of dollars in South American governmental bonds last year, a record figure.

* * * * *

COFFEE prices crumbled so rapidly that one day the exchange closed early in accordance with its rule to limit price changes to 2c. in one day. Brokers believe that the Brazilian Government's attempt to peg the price has failed because of expanded production.

* * * * *

RUBBER producers and consumers are planning a central selling organization capable of pooling 20 per cent of the plantation rubber whenever necessary to maintain price. F. R. Henderson, president New York Rubber Exchange, opposes the idea, saying that an open market has kept the price between 18 and 28c., whereas most violent fluctuations (35c. to $1.21) occurred during the British growers' attempt to restrict the output . . . Tire manufacturers have a 16,000,000 inventory, 40 per cent above a year ago, and about a 2-months' supply—said to be without danger as long as crude rubber prices remain steady.

* * * * *

UTILITY earnings (gross) are steadily increasing, year by year. Net earnings are increasing at an even higher rate. For the first eight months of 1926 net was 35 per cent of the gross; now it is 43 per cent.

ESTABLISHED 1855 VOL. 124, No. 17

Studies on Migration of Industry

Industrial Methods of Communities —Reasons Underlying Location or Relocation of Plants—Growth in Smaller Cities

SEVERAL months ago studies were put under way by the Policyholders' Service Bureau of the Metropolitan Life Insurance Co., in conjunction with the Civic Development Committee of the National Electric Light Association, with the object of determining the reasons underlying movement of industries from one community to another and from one general area of the country to another. At the same time, the location of new industries within given areas or communities was studied, as well as the reasons back of the losses, sustained by certain communities, in the industrial fabric of the country.

What follows is taken from a summary of the survey, and from an address delivered by William J. Barrett of the Policyholders' Service Bureau, which was read before the Connecticut Chamber of Commerce, Hartford, last May.

Two forces are causing considerable thought to be given to the subject of industrial development. (1) Many cities have come to realize that their social and economic advancement depends upon the industries within their borders, and are beginning to give attention to those industries and to the securing of additional payrolls. Industry, on the other hand, has been caused to study intensively its present location and, where movement is contemplated, to arrive at a future location by scientific means.

Many of the larger cities, realizing that they cannot depend entirely upon past momentum, have set about actively to exploit their advantages of a large market, established industries, available labor supplies and intensive transportation facilities. Smaller communities have been active in urging the advantages of stable labor and ideal working and living conditions.

Plants Gained by Communities

It has been estimated that nine-tenths of all industries are improperly located. They have been placed where they are by rule-of-thumb methods, for personal reasons, or for other causes of unscientific character. In many cases the inadequacy of present location is a result of changed conditions.

Mergers and consolidations are doing a great deal to focus attention on proper location. Keen competition, foreign and domestic, has caused industry to seek the lowest possible costs, both in production and in distribution. It is realizing that strategic location is an important factor in lowering costs to the consumer.

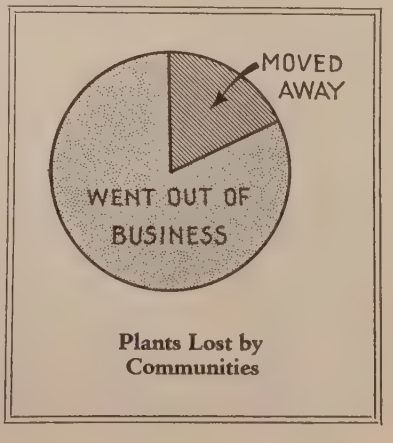
Industrial relocation since the World War has had wide publicity. Among the larger groups of movements have been that of the cotton textile industry to the Southern States, the setting up of an immense rayon industry in the South, development of a large shoe industry in the St. Louis territory, movement of the center of the steel industry from Pittsburgh and development of the Kraft paper industry in the South.

To secure their share of gain in these shifting industries many communities have sought to attract individual plants. Advertising campaigns, offering freedom from taxation, in some cases providing rent-free factories for a period of time, have been among the means used.

How the Survey Was Made

Two general objects of the survey were: (1) To measure for a two-year period, in terms of number of plants and of employees, the extent and nature of certain phases of industrial developments in the United States and Canada; (2) to define the underlying economic reasons which brought about these changes.

In studying the question, information was gathered concerning the name of a company participating in any one of the three items mentioned on page 1090, together with data on the product manufactured, the number of employees, sources of capital



Plants Lost by Communities

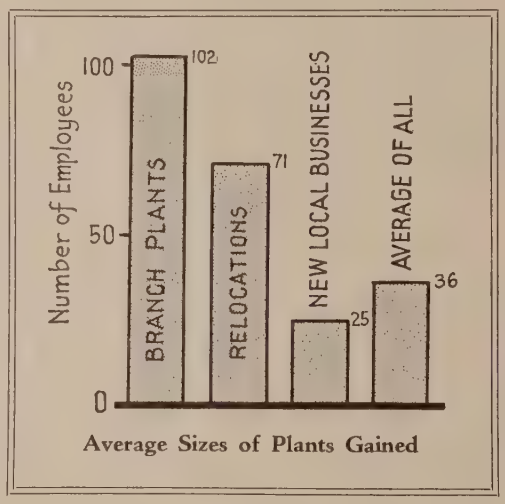
of new local industries and reasons underlying the development. In addition, movements away from a given community and information regarding firms which had gone out of business were sought, but with less success.

Both questionnaire and personal interview were utilized in securing the desired data. It was recognized that there are four distinct types of industrial development:

1. Growth resulting from the acquisition of industries which have moved to a given point from another city—a relocation.
2. Growth through the establishment of branch plants.
3. Growth through the organization of new local industries.
4. Growth through the expansion of existing industries—a phase which was not included in the survey.

Reports were had from 1934 cities or communities in the United States and 150 in Canada, representing 90 per cent of those in the United States with 10,000 or more people and one-third of those having between 2500 and 10,000, together with a large number of smaller communities, and two-thirds of the urban population of Canada. The information covered more than 16,000 firms, employing approximately 600,000 workers. More than 10,000 plants were gained by the 2084 communities.

Bodily shifting of industry from one community to another, although it has assumed much importance in the public eye, is on a relatively small scale. Such relocations account for only 10 per cent of the plants gained by the different communities. New local industries represented over 80 per cent of the growth in number of plants; branch plants were responsible for about 9 per cent. Thus, the outstanding factor in industrial development is the upbuilding of a community by new local industries.



Average Sizes of Plants Gained

Branch plants proved to be larger than any of the others studied, averaging 102 employees. This compares with 71 employees in the average relocation of plants and only 25 in the average of new local plants. The average for all plants gained by communities was 36 employees.

In the two-year period covered by the study the various communities lost 5908 plants, or about 58 per cent as many as the plants which were gained. Of the losses, 82 per cent went out of business; the remaining 18 per cent moved away. The average size of plant lost was 35 employees.

Growth of Industry in Small Places

SMALLER communities are growing in importance as industrial locations. This includes both the isolated small city and the suburban community. Several underlying motives for the growth of industry in smaller communities are: Stable labor supply, good living and working conditions, lack of congestion, ease of transportation and available power. The suburban community offers the advantages of the large city, without its disadvantages.

Cities under 10,000 population received more than one-quarter of all branches reported, more than one-sixth of the relocations and one-tenth of the new local industries. Most frequently mentioned as reasons for this movement were, in order of frequency: Markets, labor, transportation, materials, available factory buildings.

Information on plants lost was difficult to secure. Such communities as have the data do not care to give it out. Information was obtained, however, from plants which had moved, of their reasons for leaving their earlier locations.

One plant locating in a small community found it difficult to hold a supervisory force. These people had become accustomed to the social and recreational advantages of a large city and missed them greatly in the small community.

In another case, a gray iron foundry was located in a small community. The growth of the business was rapid and a considerable expansion was needed shortly. Investigating the labor supplies in the community and adjacent territory, the management found that present requirements were absorbing practically the entire employable population. It thus became impossible to make the needed expansion at that point.

One small community was found so favorable for industries that its industrial development has gone considerably ahead of its size and recreational facilities. It has started to provide such facilities, as a partial result of which land values in the retail business section have gone skyward.

One reason for a recent movement of industries to small cities lies in the fact that many of them have, within the past five years, received the advantages of electric power service formerly enjoyed only by the larger communities. This has made it possible for industries to locate in these smaller places with full assurance of dependable 24-hr. electric service from an inter-connected system. It is significant that the preponderant movement in six of the nine geographical areas is from the larger to the smaller cities.

Middle Atlantic States Gained Most

Of the movement of an industry from one community to another, that between the Middle Atlantic States (New York, New Jersey and Pennsylvania) and New England is of some interest. Practically 86 per cent of the movement into New England was from the Middle Atlantic States, the principal trend being from New York into Connecticut. Conversely, most of the plants moving out of New England went into the Middle Atlantic States.

As a whole, the Middle Atlantic States showed the greatest gains due to relocations of industry, with New England second. The Middle Atlantic States led in new branch factories, with East North Central territory second. The Middle Atlantic States are substantially ahead in establishment of new local plants; New England stands second in this respect.

Cold Worked Gun Forgings

The forgings for guns manufactured during the past year have all been cold worked, according to Major-General C. C. Williams, chief of ordnance, United States Army. At a meeting of the Army Ordnance Association, Oct. 10, he said that 165 forgings have now been produced by this method and not one has failed in service. Watertown Arsenal has continued to make minor improvements in the process and equipment, but the process is now standardized and is highly satisfactory.

Evolves New Beehive Coke Process

Humphreys Coal & Coke Co., After Long Experiments, Obtains Product Meeting New Specifications of Foundries

MORE exacting coke specifications from foundry consumers and growing competition from by-product coke producers have led the Humphreys Coal & Coke Co., Greensburg, Pa., to evolve a process for manufacturing beehive coke comparable with by-product coke in both physical characteristics and chemical analysis. The Humphreys company, a subsidiary of American Radiator Co., with mines and ovens in Westmoreland County, Pa., operates in the famous "Old Basin" Connellsville seam.

During the many years of its history Humphreys beehive foundry coke has enjoyed a good reputation, both for its chemical and physical characteristics. Until recently, however, the coke was manufactured from coal that received no preparation or refinement prior to coking; nor was any effort made to control the porosity and shatter qualities or weight by formulæ in the introduction of air into the ovens. As the coke requirements of modern foundries became more exacting, the company realized that, if it were to supply satisfactorily the foundries of the parent company, as well as a large outside trade, improvements in beehive coke would have to be introduced.

The Humphreys situation was complicated because the company's production of coal is limited under its leasehold to a comparatively small tonnage, equivalent only to the requirements of its battery of 145 ovens. With this limitation there was an additional reason for producing a quality product marketable at a premium price.

What Foundries Now Expect of Coke

A better understanding of the problems that faced the Humphreys company in getting out a product which would meet the test of modern usage is afforded by the following comparison of characteristic specifications of today with those of a few years ago:

Old Specifications

Shatter index (standard of the American Society for Testing Materials used) 60 to 65 per cent on a 2-in. screen

Porosity—its utility not understood.

Weight per cu ft.—its importance not valued.

Ash—less than 12 per cent

Sulphur—less than 1 per cent

Volatile and moisture as low as possible.

New Specifications

Shatter index over 85 per cent.

Porosity variable from 48 per cent to 55 per cent to suit the requirements of the consumer.

Weight per cu. ft.—29 to 33 lb. to suit the requirements of the consumer.

Ash—as low as possible, consistent with structure; preferably less than 10 per cent.

Sulphur—less than 0.75 per cent.

Volatile and moisture low with a correspondingly high fixed carbon, which should be 89 per cent or over.

In setting out to meet the new specifications outlined

GENERAL View of Surface Plant, Showing Pangborn Dust Arresters and Classifiers on Right, Preparation Plant in Center, and Ovens on Extreme Left

on page 1091, the company installed a laboratory at its plant and engaged a chemist and metallurgist. This laboratory is believed to be the first of its kind in the Connellsville district. With the laboratory in operation, a series of experiments covering a period of three years was undertaken. In these experiments the company sought to determine the proper type of mechanical coal cleaning equipment to install, the best size of coal to make the toughest coke in beehive ovens, and the proper size of coal to give the most efficient separation. Exhaustive study was made of the further desulphurization of coke by use of acid in the coal, and methods of introducing air into the ovens to improve and assume control over porosity, weight and shatter index. Nearly all of this work represented pioneering in beehive coke manufacture.

The extent to which the company has been successful in solving these problems is best illustrated by the following typical analysis of its foundry coke:

Shatter Index:			Per Cent
On 3-in. screen	76 per cent	Moisture	0.60
On 2-in. screen	88 per cent	Volatile matter	0.70
Porosity	52 per cent	Fixed carbon	89.55
Weight per cu. ft.	32 lb.	Ash	9.75
		Sulphur	0.66

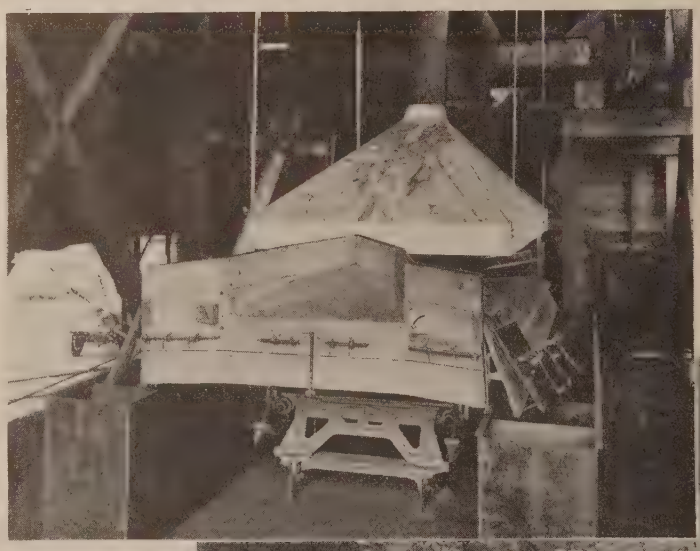
Pneumatic Separation Utilized

After the coal is brought to the preparation plant from the nearby mine, it is first crushed to a proper fineness and then passed over pneumatic separators, furnished by the American Coal Cleaning Corporation. Here a novel arrangement has been introduced by giving all the coal a primary treatment and a portion of it a secondary treatment over the separators. This is done to insure uniform chemical quality. With only one treatment, which is customary, an extra quantity of refuse in the feed coal may not all be eliminated, but with a secondary treatment complete elimination to a predetermined standard is assured. After the coal has been run through the separators, it is given a treatment of acid to reduce further the sulphur content of the resultant coke.

After the coal passes into the ovens and during the entire coking period, operation is regulated with extreme care to insure the proper porosity, weight and shatter index. The porosity and weight per cu. ft. can be and are varied to suit the requirements of the various customers. This diversification ranges in porosity from 49 to 56 per cent, and in weight per cu. ft. from 28 to 34 lb. This effort on the part of the producer to meet the requirements of its customers is another recognition by the Humphreys company of the economies in foundry operation to be derived from the use of the proper kind of coke.

Sea Coal Produced as By-Product

During the process of coal beneficiation by the pneumatic process, considerable fine dust is produced. This is collected by means of Pangborn dust arresters, which have been erected adjacent to the preparation plant, and is classified into two sizes which are marketed as sea



ONE of the Pneumatic Separators in Cleaning Plant. Here all coal is given a primary treatment, and a portion of it a secondary treatment over the separators to insure uniform chemical quality

THE Structure of the Coke Before Hand - Drawing from a Beehive Oven Is Clearly Shown in This View

HAND-Drawing of the Coke Has Little Effect on the Size Because of Its Toughness

coal, or as an alternative can be re-introduced into the coking coal.

The analyses of the two grades of sea coal are:

	Per Cent		Per Cent
No. 1 Grade		Volatile matter	30.5
		Fixed carbon	62.5
Through 100 Mesh	94	Ash	7.00
Through 200 mesh	62	Sulphur	0.80
No. 2 Grade		Volatile matter	31.4
		Fixed carbon	61.55
Through 100 mesh	60	Ash	7.05
Through 200 mesh	20	Sulphur	0.83

While this sea coal might be termed as a by-product of the coal preparation plant, the No. 1 grade is comparable with the highest grades which are manufactured.

Each car of foundry coke is tested for shatter index, porosity and weight per cu. ft. and analyzed for volatile matter, moisture, ash, fixed carbon and sulphur. Through the laboratory close control is maintained over the proper functioning of the coal crushing and coal separation plants, as well as the proper formulæ for air control of the ovens. In fact, the laboratory is used to exercise control over the coal from the mines to the finished coke in cars. Every active working place in the mines is analyzed at stated intervals, and an inactive place is not resumed until a complete analysis is made.

Enlarge Old Motor for Reversing Blooming Mill Drive

BY G. P. WILSON*

REVAMPING of a motor driving a reversing blooming mill at the Indiana Harbor, Ind., works, Youngstown Sheet & Tube Co., to accommodate larger equipment, was recently accomplished by increasing the size of the motor from 5000 hp. at 40 r.p.m. to 8000 hp. at 50 r.p.m. The old motor, installed on the 35-in. blooming mill in 1918, was supplied with power from a 3500-kw. flywheel motor-generator set with two 1750-kw., 600-volt, d.c. generators.

Increasing the power of the motor necessitated the replacement of the present armature copper with greater cross-section, to allow for this increased rating. To improve operating conditions further on the motor, under peak-load conditions, tapered inter-poles were provided on the machine and new compensating and commutating windings. The old shunt field coils were removed and new field coils with improved insulation were provided.

New end bells and baffle plates were installed, which will improve the ventilating condition of the machine. Redesigning the ventilation of the motor in line with present-day practice, and increasing its horsepower to 8000, necessitated increasing the amount of air to the motor from 40,000 cu. ft. to 80,000 cu. ft. a minute.

The increased horsepower rating of the motor required new generators which would have a combined rating of 6000-kw. and a 5000 hp. driving motor for these generators. The speed of the mill motor was raised from 40 to 50 r.p.m. by increasing the voltage of the generators from 600 to 700. The new set and the revamped motor are provided with a new control, and a foot-operated master switch replaces the old hand-operated master switch. The field relays for the motor and generator are of the latest improved type. This new control will increase the performance of the set enabling faster acceleration and increased over-all performance to be made.

The old flywheel set and control will be left installed as a standby, so that the motor may be operated from either the old set or the new, thus assuring available power for driving it. The motor has a spare armature also, so that this arrangement of the two motor-generator sets will make the power supply conform to the spare that is available for the motor.

When completed the installation will be the only one of its kind operating in steel mills, and will be the second largest reversing mill installed. Comparison of the operation of the new foot-master control with the old hand-operated control will then be possible.

*General engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh.

Heat Treating Woodsmen's Axes

Lead and Salt Baths, Electrically Heated and Automatically Controlled, Improve Output and Cut Costs Made by Semi-Muffle Furnaces

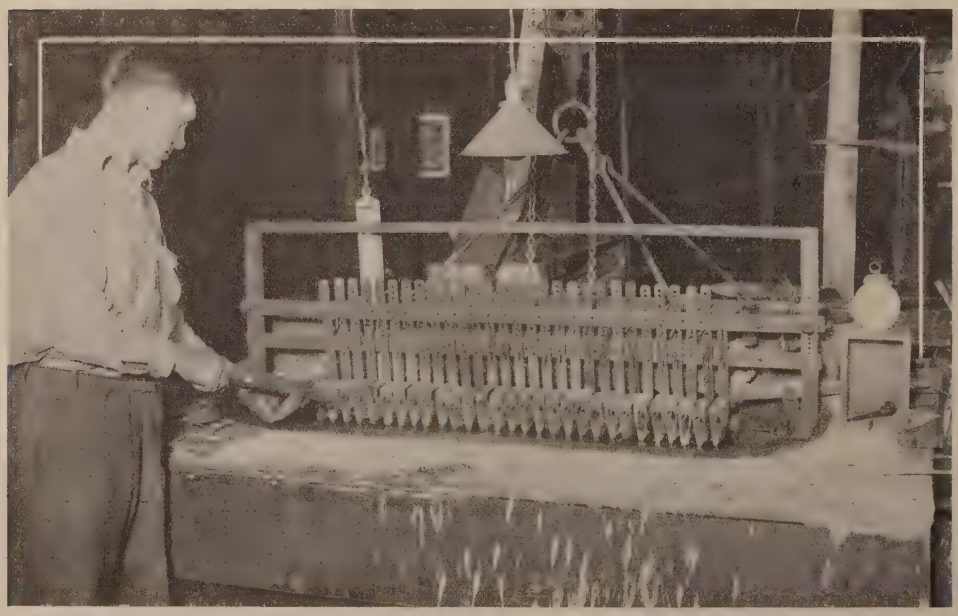
AN opportunity to appraise the over-all costs of heat treating carbon steel tools, and to show that reduction in collateral costs may overbalance an increase in fuel cost, occurred in the plant of Warren Axe & Tool Co., Warren, Pa., manufacturer of high-grade axes and logging tools of some 33 years' experience. As described by Wirt S. Scott, Westinghouse Electric & Mfg. Co., Mansfield, Ohio, in a paper before the meeting on fuels, American Society of Mechanical Engineers, Philadelphia, Oct. 7, the body of an axe is forged from low-carbon steel, and to this is welded the cutting edge, consisting of high-carbon crucible steel. Only the blade or cutting bit needs to be hardened; hence it is unnecessary to heat the entire axe except for obtaining a blue temper color, which is a characteristic and advertised feature of the company's highest grade tools.

In the past, in order to secure the best results obtainable from fuel-fired furnaces, each axe was individually hardened and tempered. Despite the utmost care in heat treatment and testing, the necessary free replacements of tools sold under an unconditional guarantee became an appreciable item, and one to be eliminated if possible. This resulted in extensive investigation of new ideas and new methods of heat treating the parts, particularly as applied to tempering.

Prior to electrification, the axes were heated in semi-muffled, gas furnaces. Individual treatment was thought to produce the ultimate quality. The possibility for error in judgment on the part of the heat treater was appreciated, but this was minimized by the employment of experienced heat treaters.

To secure the dark blue color of tempered steel was the aim of the heat treaters in the final operation, but the accomplishment was a matter of judgment, subject to many variables and resulted in different shades of tempered steel and different degrees of hardness. To improve the quality of product, and to secure the most dependable uniform quality, it was decided to eliminate some of the variables, and reduce others to a minimum, through the use of electric heat, regardless of the operating cost.

After electric furnaces were put in operation, the entire method of heat treatment was reversed. Equipment included batch-type, semi-continuous operation, bath-type furnaces in place of hearth type; separate hardening and tempering furnaces; one hardening and one tempering furnace in place of five combination hardening and tempering furnaces.

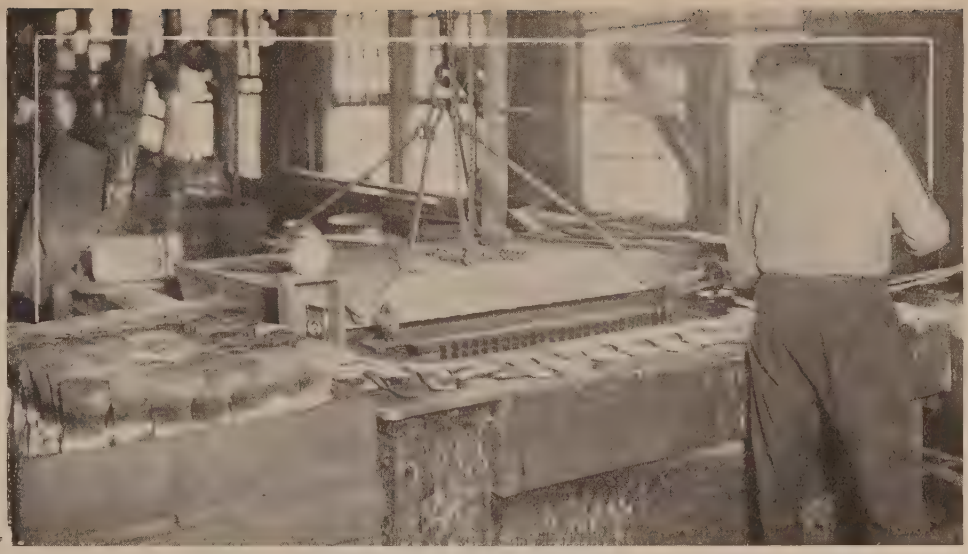


SALT Tempering Bath, with 29 Single-Bit Axes in the Bath. Hot axes are replaced by cold ones at regular intervals. Steady operations and unique current control hold temperature of bath within close limits

The electric furnaces are of the rectangular bath-type, consisting of a steel plate shell, lined with heat-insulating and refractory brick. Heating elements formed of return-bend coils of nickel-chromium resistors are suspended from hooks anchored in the side walls, and also placed in the bottom in suitable refractory spacer blocks.

The vessel for the bath is made of cast nickel-chromium alloy, supported from an upper flange. A nickel-chromium protective apron is placed around the flange, and over this is laid a steel top plate, to protect the brick work from damage, and prevent the molten material from entering the heating chamber.

The hardening bath is operated at a temperature of 1405 deg. Fahr.; the vessel is 22 in. wide by 60 in. long and 14 in. deep. The electrical capacity is 65 kw.



TEMPERING Double-Bit Axes in a Special Salt Solution That Tempers and Blues the Axe at the Same Time. There are 26 double-bit axes completely immersed in the salt bath

The tempering bath is operated at a temperature of 580 deg. Fahr.; the vessel is 12 in. by 46 in. at the top, and 12 in deep. Its electrical capacity is 57 kw.

Coils in each furnace are divided into two equal circuits, each operated by separate contactor switches, which are opened and closed by means of temperature recording and controlling pyrometers.

Two thermocouples are used with each furnace, one of the protected type plunged in the bath; the other is bare and placed within the heating chamber. This double protection and control is necessary to protect the heating elements fully against excessive temperatures, particularly during the heating up periods, and to maintain the bath temperature constant within 7.5 deg. Fahr.

Theoretically, if a definite amount of heat be supplied each minute to a bath, it should be possible to put just enough work through it each minute to hold the temperature constant. Some means should be employed to indicate whether or not the operator was working at the correct rate. This may be accomplished by placing three contacts on the pyrometer, operating three lamps. A white light would indicate correct temperature; a blue light, temperature too low; a red light, temperature too high; a white and blue light, a downward swing in temperature; a white and red light, an upward swing in temperature.

In practice, it is impossible to comply entirely with the theory above outlined. For one thing the weights of axes vary, consequently the rate of heat absorption is not constant. This condition necessitates a furnace having a capacity sufficient for heating the largest charge at the given production rate, and, as a factor of safety, an excess capacity for unforeseen contingencies. The temperature variation of this combined system under the worst conditions was sufficient to hold the hardening temperature within 15 deg. plus or minus. In order that the signal system noted above should burn continuously, and not intermittently, it was necessary to use two recording and controlling instruments, one for the bath and one for the heating chamber.

The use of two control instruments, two separate contactor switches and two circuits in each furnace opened the way for an investigation for further refinement of temperature control. Temperature surges had been reduced from 30 deg. to 20 deg. by controlling the temperature of the heating zone. If the amount of energy necessary to control, on and off, intermittently, could be reduced, the corresponding surges in temperature would

DOUBLE-BIT Axes Are Being Heated in the Electrically Heated Lead-Hardening Furnace. The bit only is immersed in the lead. Note the three lamps on the wall at the extreme right, with the white light showing, indicating proper temperature and correct rate of production. The brine quench tank is directly back of the furnace operator. After finishing the day's production, the rack for holding the axes in the bath is removed, and the insulated cover is placed in position over the lead bath, so that the lead is still in a molten condition next morning

be reduced. This was accomplished by taking one circuit of the furnace entirely off the recording control pyrometer for the bath and placing it on the control pyrometer for the heating chamber, with the net result that one-half of the furnace capacity was in constant service and one-half in intermittent service.

Whether one circuit or both circuits are on, they are at all times under the control of the heating chamber thermocouple and pyrometer, cutting off the current entirely should the temperature of the heating chamber rise to a predetermined point, and cutting it on again as the temperature is lowered. With this scheme, the temperature fluctuation was reduced to 7.5 deg. Fahr. plus or minus.

Furnaces never cool sufficiently to freeze the bath, except during the week end. Heavily insulated covers are provided which, at the end of the day's run, are lifted from their stand by a chain hoist, and lowered over the furnace. Cooling over night (15½ hr.) lowers the temperature of the lead 500 to 550 deg., and this is recovered in about half an hour in the morning. The tempering furnace cools over night from 580 deg. (the operating temperature) to about 450 deg., but is reheated in 20 min. In either case, an equal amount of time is given the furnace to equalize the temperature thoroughly, before heat treatment starts.

In the hardening bath, 23 axes are suspended, point down and immersed in the lead bath up to within one inch of the hole for the handle. On top of the molten lead is placed a blanket of granular carbon, which has the effect of reducing the radiation losses, reducing oxidation of the lead, and wiping lead globules from the hot axes when removing. After the axes have been in the bath a definite length of time they are removed, quenched in brine, rinsed in clear water, and are ready for tempering. This work is done in rotation—taking one axe out, quenching it, replacing it in the hardening bath with another, removing the next, and so on.

With 4-lb. single-bit axes, 5 min. is allowed for this complete cycle, permitting the operator to work at a very comfortable pace, without hurrying. With 6½-lb. axes, an 8-min. schedule is required for 23 axes.

Operation of the tempering furnace is substantially the same as the hardening furnace, except that the entire axe is submerged in the liquid, and a double-bit axe requires only one tempering operation, whereas it is run through the hardening furnace twice, once for each blade. Tempering 4½-lb. double-bit axes, both points at one time, the length of time any one axe was in the bath was 8 min. The tempering bath holds 26 double-blade axes, or 29 single-blade axes by the changing of the jig.

One operator is required for each furnace, working on piece work, each man turning out 1450 axes a day. Two men and the electric furnaces turn out a larger production than five heat treaters previously turned out of the fuel-fired furnaces, are not rushed as they were in the past to average a certain wage per day, and have better working conditions.

Maintenance Costs

Maintenance of the gas furnaces was amazingly small ($14.90 a month) due to the simple construction of the furnaces, and to the fact that the heat-treaters supplied most of the labor at no cost, since they were on piece work.

No expenditures for repairs to the electric furnaces have occurred to date, but the vessel of the hardening furnace will have an average life of 6000 hr. Tempering vessels have been in use for 13,000 hr. with no signs of depreciation. If a vessel costs $800 installed in the furnace, and is used 200 hr. per month, the monthly depreciation is $23.20. Two hundred eighty lb. of lead and 28 lb. of tin are used each month in the hardening bath to make up the loss of metal, which amounts to $31. One ton of granular carbon will last 9 months, and costs $50 delivered. Average monthly cost is therefore $5.60.

One barrel of special tempering salt costs $75 and lasts three weeks. This item amounts to $100 a month.

Recapitulating the total maintenance per month for the two electric furnaces is:

Vessel	$23.20
Lead	31.00
Carbon	5.60
Salt	100.00
Total	$159.80

"Slush Molding"—What It Is and How Conducted

RECENTLY an inquiry came to THE IRON AGE as to what "slush molding" of cast iron is. There is no allusion to it in the literature and questions propounded to a number of foundrymen were without results. Finally, however, an answer was obtained.

Slush molding is nothing more than the well known method of making zinc statuary applied to cast iron. When a statue is cast, the mold made with the pattern has no core. After molten zinc is poured into the mold, it is held until a coating against the walls, about ⅛ in. thick, has set. By turning the mold upside down the remaining molten zinc is poured out. This leaves a hollow statue, which is bronzed and sold for genuine.

This method can be successfully applied to cast iron, but not to aluminum. In making a kettle, for example, no core is used but the molten iron is poured into the mold, allowed to stand just long enough so that the desired thickness of metal sets against the mold surfaces, after which the still molten iron is poured out. Several kettles can be made with the remaining iron so long as it is sufficiently hot. The time allowed for hot or cold metal would be a matter of experience.

The whole process depends upon the rate of cooling of the molten metal in contact with the green sand of the mold and with comparatively cold and damp mold walls. It is also essential that the metal have a fairly wide range of temperature from the liquid to the solid state. A rich gray iron has this when high in silicon. In the case of aluminum the metal sets practically all at once and slush molding cannot be employed.

Measuring Open-Hearth Temperatures Accurately

ONE rather surprising fact in connection with gas temperatures in the open-hearth furnace, has recently been reported by A. Schack in *Stahl und Eisen*, 49 (1929), pages 1196 and 1197. This is that in five different furnaces the upper limit of temperature in the outgoing gases at the ends of the furnaces is no higher than 1610 deg. C. (2930 deg. Fahr).

Measurements were made with the "Durchflusspyrometer," a thermocouple so arranged that a stream of gas is drawn rapidly over the hot junction, thus minimizing errors due to radiation from surfaces hotter or colder than the gas.

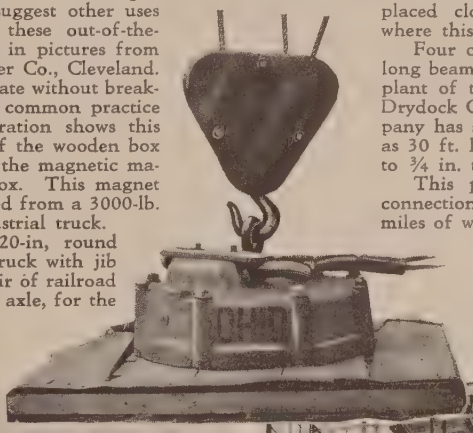
Temperatures of outgoing gases measured in this way at the top of the checkers were some 120 to 150 Fahr. hotter than those obtained with the ordinary couple. With incoming air, at the same location, the "true" temperatures were from 180 to 270 deg. Fahr. lower than those found by usual procedures.

Unusual Uses of Magnets in Handling Materials

WHILE electric magnets have for some years been standard equipment for handling scrap, pig iron and many other items of iron and steel, both in steel mills and foundries and in scrap yards, there are a number of uses to which magnets have been put in some plants which may suggest other uses to other plants. Some of these out-of-the-ordinary practices are shown in pictures from the Ohio Electric & Controller Co., Cleveland.

Picking up a box of tin plate without breaking out contents has become common practice in some plants. One illustration shows this operation wherein one side of the wooden box lies between the magnet and the magnetic material contained within the box. This magnet 18 in. in diameter is suspended from a 3000-lb. jib crane on an electric industrial truck.

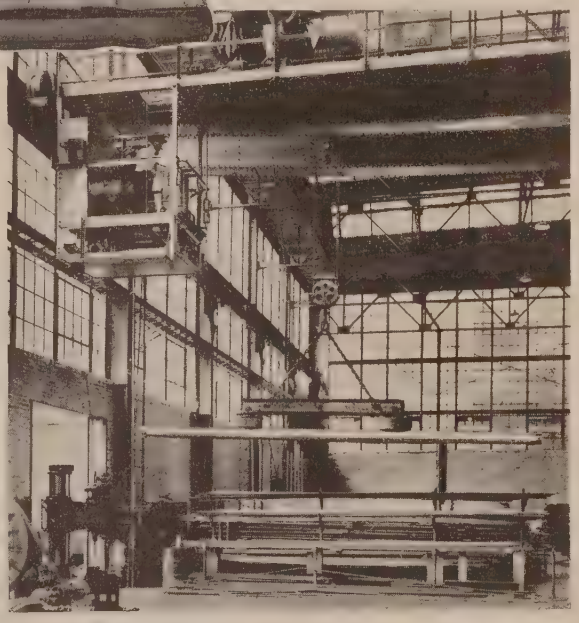
Another view shows a 20-in, round magnet, also on an electric truck with jib crane attachment, lifting a pair of railroad carwheels with the connecting axle, for the Indiana Harbor Belt Railway at Indiana Harbor, Ind.



Two small magnets (20-in.) on a spreader-beam are used for handling pipe, as shown in a third illustration. These magnets will pick up about 900 lb. of pipe in several sizes and save time and labor in so doing. Space is saved also, because the pipe racks may be placed close together, without aisle space, where this method is used.

Four of these 20-in. round magnets on a long beam are used in handling plates in the plant of the Newport News Shipbuilding & Drydock Co., Newport News, Va. The company has six such sets, taking plates as much as 30 ft. long by 8½ ft. wide, and from ⅜ to ¾ in. thick.

This particular job was undertaken in connection with machining plates to form 90 miles of water pipe 6 ft. in diameter, for use in California. There were 5145 carloads of these plates to be handled. The magnets unloaded the plates, piled them, carried them from machine to machine and finally loaded them on shipboard.



Conveyors Reduce Factory Accidents

Growth of Mechanical Transportation, However, Has Created Special Hazards from Which Workers Must Be Protected

BY W. DEAN KEEFER*

As related to industrial progress in metal-working plants, this might be called the age of conveyors, for the increased use of mechanical means of transportation has in large measure enabled the metal-working plants of the United States to make such pronounced world-wide production and efficiency records.

One of the most important benefits coming from the employment of conveyors is in lessening industrial accidents. Although conveyors are seldom installed wholly to prevent accidents, they usually replace hand labor, and this reduction in the working force tends to cut down the number of personal injuries because of the decreased man-hours exposure.

One reason why our modern factories have been able to effect such pronounced reductions in accidents is because of the displacement of dangerous operations by the use of conveyors. This is one form of engineering revision which has become closely associated with sound safety work. Fatigue, cluttered-up working places, congestion, irritating delays due to accidents and many other forms of industrial waste are being minimized by the engineering application of mechanical principles in handling materials.

However, mechanical conveying systems introduce special hazards which must be recognized, for the reason that accidents resulting from them are usually quite severe. A conveyor represents a mass of moving steel under the control of power. It is not surprising, therefore, that most injuries to men who become caught in conveyors are likely to be serious, probably resulting in broken arms or legs or a crushed body. For this reason no conveyor system can be considered complete until it is pro-

vided with every possible mechanical device for safety, to lessen such accidents and hazards.

Conveyor Hazards Discussed at Safety Meetings

Conveyor accident hazards are always important topics of discussion at regional and national safety conferences. For example, one of the outstanding addresses at the 1926 National Safety Congress was on "The Hazards of Assembly," by R. F. Thalner, safety director of the Buick Motor Co. He indicated as his experience that a large percentage of the hazards of assembly was in the use of conveyors. He listed them as hazards in transportation from machine shops to assembly plants, in sub-assembly and in main assembly. Under the latter he listed hazards with conveyor lines, chains, motive power and stop buttons. Additional hazards occurred in connection with appurtenances to conveyor lines, such as in frame-riveting, ventilation, furnaces and hammers and hazards with cables, and their inspection, lighting, stock bins for small parts, belts and gears, steaming room, painting and drying, subconveyors, hoists, pit work, punches, drifts and chisels.

Mr. Thalner is of the opinion that conveyors are probably the most efficient and safest method for transporting stock, provided the equipment is properly installed.

Conveyors which require attention only at the loading and unloading ends eliminate to the highest degree possible the human factor, because in the entire process of transportation the only help required is in feeding the conveyor and removing the stock when it has reached the assembly line. Some additional help must be employed to maintain the equipment, "but this," as Mr. Thalner states, "is usually of a higher caliber than ordinary labor and consequently can be relied upon to protect itself. Proper mechanical safeguards over gears, chains and belts, as well as a number of stop stations along the conveyor, will make this equipment almost 'fool-proof.'"

As another protection for a conveyor system, the motor equipment should be completely inclosed. This is needed not only as a safety precaution, but also to protect the system from possible damage, for shutdowns are always costly.

Repairs Should Be Made While Conveyor Is Stationary

It is a good safety rule that no adjustments or repairs of any kind on a conveyor system should be made while the conveyor is in motion. Through the use of modern pressure oiling and greasing devices, however, the oiler may be able to reach out-of-way places without special hazards. Extension pipes on oil and grease cups are also a good protective device. Automatic gravity oilers are in wide use, and a central oil reservoir or container is not only economical but removes accident hazards.

Conveyors should not be started without first giving warning to the men who may be making repairs or adjustments or oiling the machinery. Every repair man should be provided with a lock or a warning sign, which

he should put on the starting lever or control switch before starting his work on the conveyor. Rules forbidding anyone to remove a lock or a warning sign, except the person who placed it, should be rigidly enforced.

In the case of long conveyors running through two or more rooms, or in one room to points from which controls or lever cannot be seen, it is sometimes a good plan to provide a gong or a whistle to be sounded by the operator about a half minute before the machinery is started, thus giving warning to anyone who may happen to be in a position of danger.

National Conveyor Safety Code Being Formulated

The problem of protecting conveyors is considered of enough importance to demand a national conveyor safety code. Such a code is being worked out under the auspices of the American Standards Association, with the American Society of Mechanical Engineers and the National Bureau of Casualty and Surety Underwriters as sponsors. Twenty-eight groups and organizations, with 42 special representatives, are cooperating in formulating it. These organizations include the American Society of Safety Engineers, American Foundrymen's Association, American Railway Engineers Association, International Belting Conference, National Safety Council, Society of Industrial Engineers, United States Bureau of Standards, factory representatives and other like groups. Their purpose is stated as follows: "Safe operation and maintenance of gravity, belt, chain, flight, bucket, apron, screw and jigging conveyors, car hauls, aerial cableways, overhead trolleys and pneumatic tubes."

Safety in the use of conveyors is closely associated with safe practices with belts and belt guards, shafting, coupling, pulleys, gears, sprockets and chains. Hooks and chains should often be inspected. Electrical equipment also is important. There are many possible hazards in switches, through control stations, from wiring, and in points where limit stops are made.

Proper methods of securely fastening overhead carriers of different sorts are also important, and wire ropes and cables should be frequently inspected. There are special hazards at regular cross-over points of conveyors, unless protected by elevated bridges or tunnels with proper guard rails. There is always danger in the practice often seen in factories of boys and other workmen riding on certain kinds of conveyors. Such a practice should be strictly prohibited; it usually can be done by the establishment of guard rails at proper points.

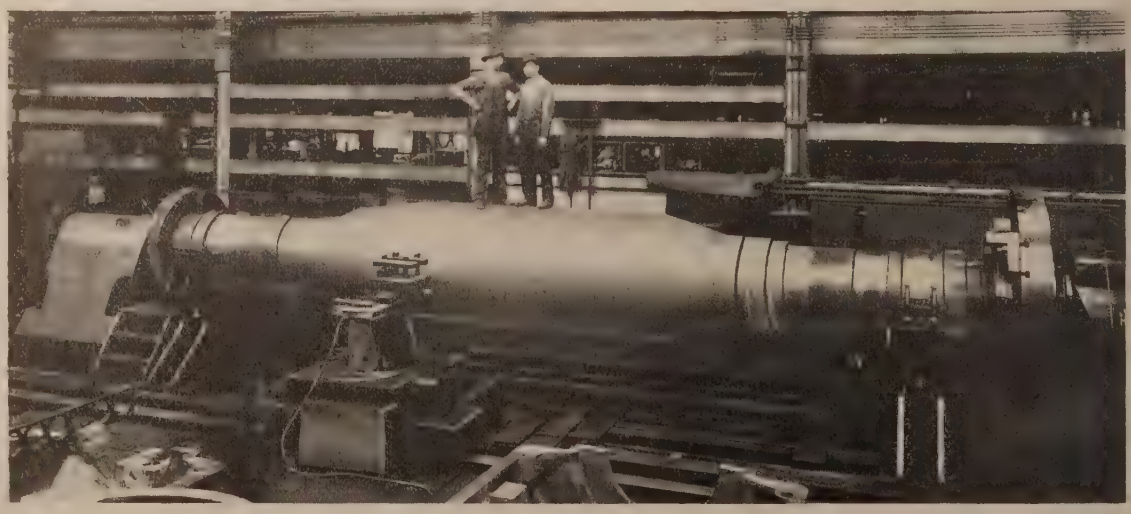
The Chevrolet Motor Co. has made novel use of one of its overhead traveling conveyors to carry safety messages. This conveyor travels slowly and safety signs are so arranged as to appear about every 5 min. at a given point. "Even a busy bee uses safety" is one of these slogans. Others are: "The safe way is the best way," "Safety ways prove safety pays," "Safety ways bring happy days," and "Today is safety day."

Many factory accidents are due to falls and therefore it is suggested that loading and discharging stations of conveyors be protected with anti-slip floor surfaces.

Overhead Conveyors Need Special Protection

The efficiency of many small plants has been greatly increased through the addition of suitable conveyors, many of which are of the overhead type. These conveyors demand special protection with nets or flooring underneath them. Where there is such overhead flooring there should always be foot-boards, guard-rails, and the like, to prevent material from falling.

Extension of conveyors from one floor to another has introduced a special fire hazard, permitting a fire, unless there is proper protection, to spread quickly between floors. Two methods have been devised to eliminate this hazard—one to inclose the chute in a tower of steel, concrete or masonry and the other to provide fire doors (draft checks) where the chute passes through the floors.



THE shaft shown in the accompanying illustration weighs 140,000 lb., with a maximum finished diameter of 53 in. and an overall length of 32 ft., and is thought to be one of the largest ever built. It was forged by the Midvale Co., Nicetown, Philadelphia, from an octagonal ingot about 82 in. in diameter and weighing 290,000 lb., and was machined in the shops of the Westinghouse Electric & Mfg. Co., East Pittsburgh. It is designed to be supported with the rotor on two large bearings, 30 in. in diameter and 60 in. long. The shaft will be used in the rotating part of a 60,000-kva. 514-r.p.m. horizontal generator in the Westinghouse company's test laboratory.

Possibilities of High-Test Cast Iron

Need of Classification and Proper Test Bars— Use of Alloys and Special Melting Processes

HIGH-STRENGTH cast irons offer possibilities to the gray iron foundryman not only to increase his field of operations but also to regain some of the types of work now being placed in other iron and steel groups. An essential point to be remembered is that, in the present condition of development of high-strength cast iron, this material is still in the experimental stage, and, further, as it develops, it will be necessary to classify or grade cast irons according to their merits, said E. J. Lowry, consulting metallurgist, Detroit, in a paper, "High-Strength Cast Irons," presented at the National Metal Congress, Cleveland, in September.

European investigators have perhaps been more forward in the development of this material than our own research and production men, said the author. This no doubt is due to the fact that American foundrymen are faced with the problem of mass production, whereas in Europe more time can be given to technical developments of processes surrounding the production of cast iron of new physical properties.

Various Types Should Be Classified

When one considers the nomenclature, "high-test cast iron," it is apparent that the cast iron industry has not taken full recognition of the possibilities existing in the industry. Instead of departing from empirical standards, it is continuing in the same vein. It is essential that the varying types of cast iron be properly classified. This is apparent when one considers the trade name "semi-steel." This term will allow a foundryman to make his product with as low as 1 per cent of steel in his mixture and as high as 100 per cent steel melted in his cupola. This cannot be taken as a condemnation of the product, but merely shows the latitude with which this kind of cast iron may be made.

Another illustration is afforded by the case of alloyed cast irons. In this instance claims may be made where alloys are used but no full percentage is given. It must be admitted that it would not be an easy task to classify cast irons under such methods as the S.A.E. uses in designating various types of steel for definite uses, for cast irons are more complicated in their structure, physical and chemical analyses than are steels. If, however, the engineer is to be enlightened, cast irons must be categorically named for him with subsequent listing of what might be expected in cast irons in these classes.

Quite often the engineer is guided solely by text books with an exception here and there of actual experience. It is often the case that data in text books are based on assumptions of strength obtained under varying circumstances 20 years ago. They further are based on inaccurate determinations in comparison with those made today. It is quite usual that engineering text books quote the tensile strength of cast iron as a maximum of 14,000 lb., and more usually at 12,000 lb. per sq. in. Such physical properties are ridiculous on their face value unless the specimens were cut from 2½-in. sections made from analyses of too soft a chemical composition. As an instance, keeping the section the same and using a different silicon analysis, the strength may be dropped from the range of 25,000 to 13,000 lb., when the silicon is raised from 0.75 to 2.25 per cent. It is obviously quite wrong to judge cast iron at a 14,000-lb. strength when by ordinary practice 25,000 lb. can be readily obtained.

Test Bar Needed Which Can Be Correlated

Test bars mean very little under their present acceptance. Their use is limited to comparisons for the physicals obtained by varying the analyses and the irons used in mixtures. They cannot be used to mean the actual strength of a casting. This leads to doubt by the engineer. Therefore, there is an immediate necessity for the development of a test bar which may easily be correlated to the physical properties of a casting. When this is accomplished it will be easier to understand the action of new processes developed.

Production of high-strength cast iron by the use of alloys has long been known, but to produce strengths of 60,000 to 65,000 lb. per sq. in. has led to the use of special melting processes with the subsequent addition of alloys. Such methods have not generally been accepted by foundrymen. It must be realized that a change of method requires courage, whereas a simple method of introduction of alloys could be generally accepted. Any change in the method of melting requires a revising of the usual production processes.

It has been generally thought that alloys may be introduced into inferior irons with the resulting effect that high-strength cast irons will be produced. Such is not the case. Alloys act merely as an aid to the betterment of a condition. When alloys are properly used in connection with correct section and analyses, it becomes a fairly easy matter to produce high strength without special processes. This means that when a foundryman has adjusted mixtures, he can use regular cupola metal and, with the addition of one of the known alloys, increase his average strength from 28,000 lb. to 45,000 lb., and even as high as 65,000 lb. per sq. in. The known alloys are nickel, chromium, molybdenum, vanadium and titanium.

Special Melting Processes

Too little attention has been paid to methods of procedure and basically so because of the apparent initial cost. When, however, one considers the use of special melting processes, plus the use of alloys, in comparison to a combination of alloys with regular iron, the resulting costs are apparently the same. It is easier to work with the latter method than to apply the former in production foundry work.

There are still further possibilities in the production of high-strength iron when the question of annealing is considered. A process may allow a casting to be made harder and stronger. By proper annealing the hardness and strength are little affected and yet the machinability is increased to the point of the lower strength, softer cast iron. Continued experiments with varying analyses and later heat treatments offer great possibilities for the production of high-strength cast iron.

World's Largest Nitriding Furnace

Over Two Tons Can Be Treated with Ammonia Gas—Products 11 Feet Long Hardened in It

AMONG recent developments in the process of hardening steel with ammonia gas or nitriding is the construction by the Central Alloy Steel Corporation, at its Canton, Ohio, plant, of what is said to be the largest nitriding furnace in the world.

The plant was built for nitriding large parts. It is a 580-kw. double-end car-type furnace. The heat control is separated into three sections—the two ends and the middle, the heating elements being located in the bottom and at the sides. The furnace is designed for operation at temperatures up to 1800 deg. Fahr. to permit its use as a quenching and drawing furnace as well as for nitriding.

The furnace is 26 ft. long between doors, with an effective length of 24 ft. It is 5 ft. 9 in. wide and has a loading clearance of 4 ft. 8½ in. The nitriding box is 22 ft. long, 34 in. wide and 30 in. high. It is mounted on an 8-wheel motor-driven car.

The nitriding box is of welded construction, the joints necessarily being gas tight. It is made of KA2 stainless iron sheets. The cover is sealed by tin, lead and bismuth, metals that melt at low temperatures. A platform of three 1½ x 4-in. strips running lengthwise is built up in the bottom of the box to support the material being nitrided, as it is necessary to have the work well supported to avoid warpage. Other strips, ¾ x 4 in., are placed across the longitudinal strips, which are of plain carbon steel.

The box rests on cast steel cradles which are bolted to steel slabs extending lengthwise. The slabs rest on sand covered bricks that are laid on the car platform, the sand taking care of the difference in expansion between the brick and the slabs when the box is being heated.

Ammonia is delivered from five tanks to a bustle pipe and from that to two outlets, one for connection to the box when it is outside and the other for connection when it is inside the furnace. Connection from these outlets to the box is through heavy rubber tubing that connects to a bustle pipe. This pipe feeds five ½-in. tubes made of KA2 tubing that serve as inlets. These pipes extend through the end of the box in the bottom of the box and are of different lengths, their discharge ends being 4 ft. apart permitting the distribution of the gas through the

Some Large Sections Which Have Been Nitrided. The two upper products are large piston rods for a gas engine. An impeller and a crankshaft are the other two products

box. Three 1-in. outlets provide sufficient outlet for the gases leaving the box and to take care of the back pressure. These outlets connect with a bustle pipe and from this the gas mixture passes into three other outlets which feed into water bubblers. The extent of the ammonia dissociation is determined at the outlet before the gas enters the water bubblers.

A feature that is unusual is a fan located in the box to insure the circulation of gas through the work. This is direct driven by a motor mounted on the car and connected to a shaft running through a tube into the box. Because of the high temperature, the bearings supporting the fan cannot be lubricated.

A combination of steels of extreme hardness, heat-resisting and non-corrosive, all working in a loose fit, is used to take the place of lubricated bearings. The driving shaft is of Enduro-KA2 steel. The sleeve is of nitralloy and the bushing of a heat-resisting alloy. The temperature control is by pyrometers in the roof of the furnace. For checking purposes there are also two pyrometers in the nitriding box.

The work is cleaned before it is placed in the box, making it as free from scale as possible. Then the lid is placed on with a crane and the car runs into the furnace under its own power, the end of the car carrying the motor remaining outside the furnace. When the car is in the proper position in the furnace the open end of the furnace is bricked up before the heat is turned on.

The nitriding temperature in 975 deg. Fahr. Work is kept in the furnace from 50 to 90 hr. Ammonia is introduced when the seal melts or at about 300 deg. Fahr. causing the cover to seat. It takes from one hour to 90 min. to drive out the air after the box is sealed and 5 to 6 hr. for the furnace to reach temperature. After the heat is turned off the work is allowed to cool down to about 800 deg. before being taken from the furnace. After the car is taken out, the parts are allowed to cool to about 300 deg. before the lid is taken off the container. The work comes out with a silver white finish.

The largest furnace charge to be nitrided so far is 2 tons. However, it is expected that the furnace would work satisfactorily with a larger amount of work in the box at one time. Work that has been nitrided in this furnace includes a shaft 11 ft. long and 6 in. in diameter, locomotive cross head guides, crank shafts for motor buses and piston rods and piston pins for gas engines. The maximum depth of case is 0.035 in.

The nitriding box, car and auxiliary equipment were built in the Central Alloy plant. The furnace was built by the Electric Furnace Co., Salem, Ohio.

Failures in the Brazing of Steel

TWO general methods for joining thin-walled steel tubes are in use, according to W. Riede in *Stahl und Eisen*, 49 (1929), pages 1161 and 1162. These are the torch-brazing process and the dipping process. Objection to the first is mainly on the ground that the flame melts the steel, while the second, although entailing a certain amount of extra finishing labor, appears more rational and with the exercise of care, will give uniform results.

In the dipping process, however, cracks appear in that part of the steel which has been exposed to the brass. This appearance is quite the general rule, but may be diminished by suitable aging and heat treatment.

As a result of experimentation, the following explanation is offered: Steels, which have been subjected to severe cold work, tend to recrystallize strongly when subjected to the heat of the brazing liquid. Internal stresses thus set up, accompanied by penetration of the brass between the large newly-formed grains, are the cause of the cracks.

It is recommended that the brass be kept below 1100 deg. C. In order to detect the intrusion of brass into the intercrystalline spaces a polished section is etched 3 min. in ammonium hydroxide; this shows the brass as a deep block. The grain boundaries are then brought out in the usual way with a 2 per cent solution of alcoholic nitric acid.

Much Nickel Used in Radio Tubes

ADVANTAGES of nickel for screens and plates in the screen grid tubes or other radiotrons are enumerated by C. C. Colby, Westinghouse Lamp Co., Bloomfield, N. J., writing for *Inco*, Vol. IX, No. 2. It is pliable, and the mesh can be readily formed into any shape desired; it is easily cleaned by baking in a hydrogen atmosphere, and is relatively immune to tarnishing on standing or handling; it can be readily spot-welded to other nickel parts; it has a relatively high melting point and it can be secured in a pure state at a reasonable cost.

The use of nickel mesh is restricted to the outer element of the tube for several reasons. The two grids within the plate are of comparatively small diameter, must be accurate in diameter, and if made of mesh would have to be of very open weave. Under these conditions, a more satisfactory grid can be manufactured using a spirally-wound wire than using woven mesh. In order to obtain satisfactory operation, the plate of the tube would have to be of very fine woven material if mesh were used; because of the difficulty and cost of weaving such fine mesh, solid nickel strip is still used for the plate.

In general, it may be said that every metal part within the glass bulb of the radiotron either consists of nickel, contains nickel as an alloying material, or is mounted upon nickel supports.

Efficient Wire Enameling Unit

Vertical Electric Tube Furnace, with Efficient Feed Mechanism and Temperature Control, Speeds Output and Improves Quality of Finished Wire

BY CHRISTIAN E. RUGH, JR.*

PRIME considerations in the enameling of wire is either to produce a satisfactory coating with decreased production costs or to apply a superior coating at the same cost. To achieve both of these objectives at the same time has been found commercially practical with the electric oven.

An extreme variation in varnishes and enameling procedure makes a fair comparison of different types of ovens a difficult matter. In comparative tests on two ovens, one gas and one electric, the results were judged solely upon the ability of each method to produce wire that would pass rigid inspection. A varnish that was considered satisfactory in a gas oven was used for both runs. Adjustment of temperature, speed of wire and ventilation were determined for each oven separately in order to produce a high quality of finish on the wire.

The type of electric oven used in these tests is the subject of the accompanying pictures, although the oven illustrated has 50 per cent more capacity than the oven actually used for the test. The ovens have an overall height of 22 ft. Take-off mechanisms and feeder spool racks are attached to both sides of the oven. The method of dipping the wire in the enamel is also shown.

Table I shows the result of the experiment conducted on the two different types of ovens. The same size wire was run in both cases and it was taken at random from factory stocks.

Gas used in the test was 550 B.t.u. gas and the purchase price was 80c. per 1000 cu. ft. Electricity was purchased at 1c. per kwhr. Taking into consideration the increased speed that could be obtained in the electric oven, the cost comparison becomes 0.445c. per 1000 ft. of finished wire in the electric oven as against 0.815c. per 1000 ft. of finished wire in the gas oven.

On another occasion and in a different plant, a comparative test on 28.5-mil copper wire run at a speed of 22 ft. per min. showed the results given in Table II.

Gas in the above case cost 72c. per 1000 cu. ft. and the

WIRE from Spools Passes Under Grooved Sheaves Which Dip into Liquid Varnish. More than one coat may be given by looping the wire back outside the furnace and around this sheave as many times as desirable (Below)

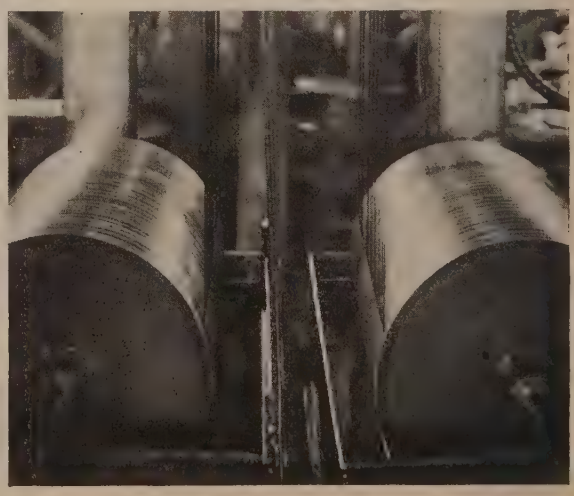

Table I.—Comparative Production of Electric and Gas Ovens

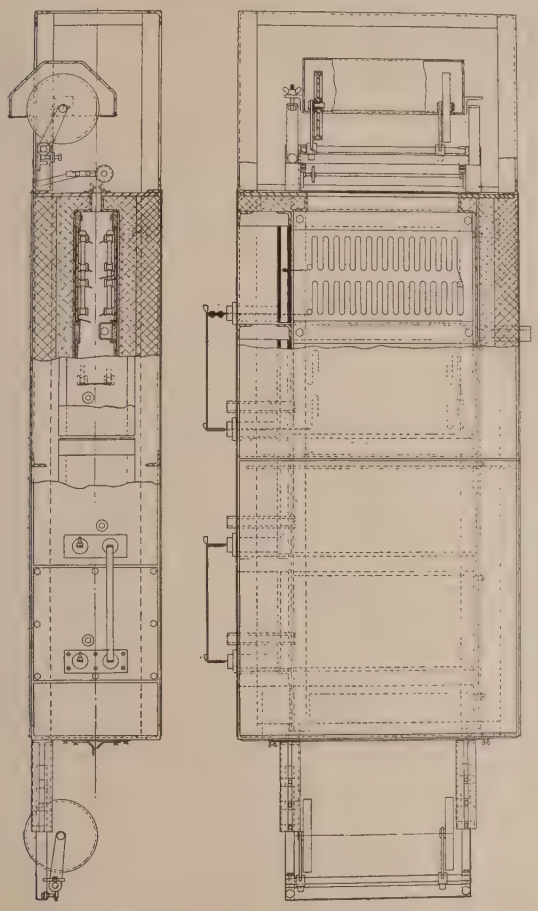
Oven	Bare Wire Dia. in Mils	Insulation Limits in Mils	Speed in Ft. per Min.	Fuel Consumption per Hour	Fuel Cost per Hr. in Cents
Electric	25.5	1.2 to 2.1	25	8 kwh.	8.00
Gas	25.5	1.2 to 2.1	22	160 cu. ft.	12.80

In both cases, the number of wires through oven was 48; the number of dips, 4, and the number of heads, 12.



VERTICAL Oven Is a Narrow Rectangular Slot Through Which Wires Are Threaded. Air circulation for oxidizing the varnish and carrying heat from resistors to wires is insured by baffles on inside walls (not shown)

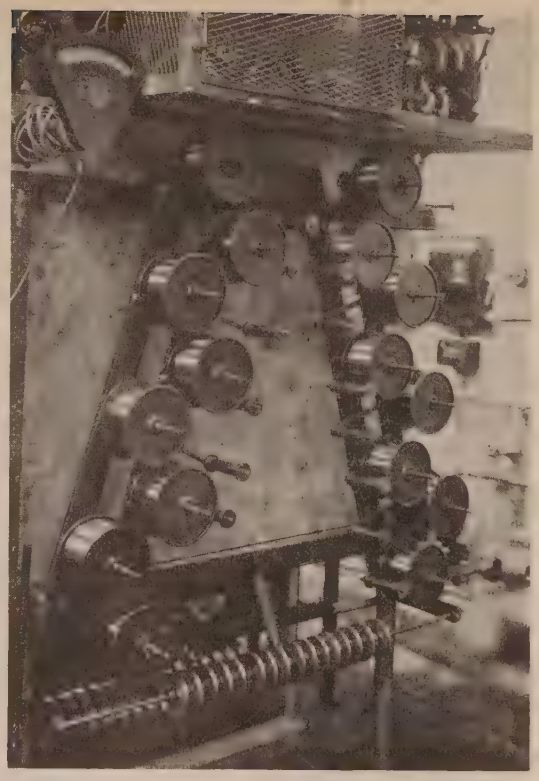
electric rate was 1¼c. per kwhr. The electric load was so desirable that a rate of ¾c. per kwhr. was made for complete electrification of the enameling plant. This lowered rate figured to a net saving of $500 per oven per year on fuel alone.

The characteristic design of an electric wire enameling oven shows that the wire is fed from spools arranged on a suitable rack mounted to the back of the oven. To

Table II.—Comparative Cost of Insulating Copper Wire

Oven	Bare Wire Dia. in Mils	Insulation Limits in Mils	Speed in Ft. per Min.	Fuel Consumption per Hour	Fuel Cost per Hr. in Cents
Electric	28.5	2.6 to 4.4	22	6.8 kwh.	8.54
Gas	28.5	2.6 to 4.4	22	178 cu. ft.	12.80

Number of dips, 8; number of heads, 6; wires through oven, 48.



ARRANGEMENT of Feeder Spool Rack and Control Panel Is Compact

anneal the finer sizes of hard drawn copper, the wire is passed under small guide sheaves and up through the oven without being dipped in enamel. The wire then passes down the front of the oven to a sheave having four grooves and dipping into the enamel. In going through the enamel, the wire picks up a thin film that flows out evenly as the wire passes into the oven. The wire is looped up and down in this manner four times and gets as many separately baked coats of enamel, of required total insulation thickness.

The distance of both bottom and top sheaves from the oven can be varied. The bottom sheave must be placed so that the enamel will flow out smoothly along the wire before reaching the heated chamber. The top must be far enough away to allow the enamel to thoroughly cool and harden before being run over the sheave.

Heating units are made of high heat resisting alloy and are so shaped as to give very efficient heat transfer to the air. Units are mounted on metal plates, suitably insulated as shown, and are removable through the side of the oven making the entire heating chamber accessible.

Quality of product is much improved by use of the electric oven. In one enameling plant the old standards required the wire to be bent around a mandrel four times the diameter of the wire without cracking the varnish coat. The specifications now call for the same test around a mandrel three times the wire diameter. It is not uncommon to take samples of electrically enameled wire from production spools and bend them around their own diameters without noticeable cracking.

A similar inprovement was found in the continuity of the varnish film on the wire. Standard requirements call for not more than 15 breaks per 100 ft. when an electric potential is placed between the wire and a mercury bath through which the wire is run. (Voltage varies with the size of wire.) Long-production runs have shown that electrically enameled wire consistently runs less than 10 breaks per 100 ft.

Other standard tests such as dielectric strength, hardness of enamel, flexibility, oil immersion and thickness showed the electrically enameled wire to run regularly well within the limits established under other methods of enameling. Reasons for these exceptional economies can be traced directly to the inherent characteristics of electric furnaces and ovens of sound design. The design is the result of extensive experience in adapting electricity to industrial heating problems.

The compact arrangement that may be effected with the electric wire enameling oven is obvious from the various illustrations. The base plate covers 12 sq. ft. and up to the height of an average man there is no overhang. The projected floor space occupied by the oven, pick-up mechanism, feeder spool rack, oven control panel, transformers and vapor condenser is 20 sq. ft.

Heat regulation is of particular importance and the arrangement of heating units compensates for losses at the points where they occur. Thus the temperature distribution within the oven is remarkably uniform. The design of heating units can also be such as to increase the temperature along the height of the oven at almost any desired rate and hold it constant at any set value. For such purposes a "high-low" power control has definite advantages. The high heat is adjusted to supply slightly more than the normal power requirements and the low heat, to supply slightly less. Any changes in temperature then take place very slowly, enabling the control instrument to function with a very slight lag behind the actual temperature change, and makes it unlikely that the temperature at other points than the control pyrometer will vary from the limits set upon the controlling device.

Coincident with the baking process, the varnish oxidizes, i.e., undergoes a chemical change. The importance of this phase of the operation emphasizes the advantages of the electric oven quite clearly. The electric oven converts power to heat with no gases of combustion. Tests on exhaust gases show no CO_2 or CO from electric ovens while exhaust gas from gas ovens showed 4 to 5 per cent CO_2, with a trace of CO, and a reduced percentage of oxygen by this amount. It is possible to control the ventilation and admission of air in the electric oven to an extent impractical in ovens using fuels.

The oxidizing process is not hindered in the electric oven but is aided by the fact that fresh air is constantly surrounding the wire at all points. To further assist the complete chemical change in the wire coating, the air is repeatedly forced across the wires as they pass up, through the oven. Continuous motion of the air is insured by placing baffles on the sides of the oven. These baffles, while they in no way obstruct the operator in stringing the wires, act in a two-fold manner. They cause the necessary air to be forced into intimate contact with the wire, as mentioned before. Since practically all of the heat is obtained by convection currents of air, the baffles cause the heated air to flow to the line of the wire, and in this manner the two requisites of baking varnish—heat transfer and oxidation—are carried on simultaneously.

Centrifugal Casting of Guns

EXPERIMENTAL work on centrifugal casting of guns leads to the belief that the process has been satisfactorily established for the 37-mm. gun, the 75-mm. infantry mortar and the 75-mm. howitzer, says Major-General C. C. Williams, chief of ordnance, United States Army. A larger casting machine for production of the 75-mm. field gun, the 105-mm. howitzer and the 3-in. anti-aircraft gun is under construction, it appears, and will soon be in operation.

General Williams discussed the subject at a meeting of the Army Ordnance Association, Oct. 10. Approximately three mobile guns, he said, can be cast from the amount of molten metal that has heretofore been required for one built-up gun made from forgings. It is estimated, he added, that a gun can be cast and cold worked in approximately one-third the time and at about one-half the cost of built-up guns forged from ingots.

The physical properties obtained from centrifugal castings after treatment are better, he asserted, than obtained from forgings of the same composition. "The metal generally is exceedingly ductile and in this respect appears to be superior to that of forgings of the same composition. . . . Also the carbon is thrown toward the center in a gradual change so that, for example, in the 75-mm. pack howitzer, the carbon may be 20 to 25 points higher at the bore than at the outside. This gives greater strength at the bore where high elastic limit is needed and a correspondingly ductile outside wall. Segregations of other elements, although not so pronounced, behave generally like the carbon."

The frame work of the doors of the Goodyear-Zeppelin Corporation's airship factory and dock at Akron, Ohio, as well as that of the building proper, were manufactured and are being erected by the American Bridge Co., although the fact was not made clear in the illustrated descriptive article on the subject appearing in THE IRON AGE of Oct. 3.

Trade Association Is a Necessity

Group Effort Is Talisman of Successful Business—Sound Competitive Conditions and Expanded Markets Unobtainable Without Cooperation

BY CHARLES N. FITTS

WE are in the throes of economic forces which are steering us to new fields of endeavor, new opportunities of service, wider outlook and a greater spirit of industrial cooperation. Coincident with the narrowing margin of profit and the intensive cultivation of markets, we find business executives helplessly carried along with the tide. It is not to be wondered at that they are discovering that unless they are willing to cooperate with their competitors across the way, harmonize with other independent units in the industry, they will soon be swept aside, driven into a court of bankruptcy or swallowed up in another merger.

Business Individualism Invites Competition

The growth of the cooperative movement is something unprecedented. The Department of Commerce estimates that there are 13,000 trade associations and organizations in the United States, of which some 2000 are national in scope. This is more than six times as many as were operating 15 years ago.

In staid New England, where we have for generations believed and practised individual rights and maintained the most rigid spirit of aloofness, we are just emerging from a serious industrial slump. This depression, I believe, was due entirely to our tardiness in appreciating this newer trend in industry, which has fostered a widespread tendency toward cooperation in all sections of the United States. Once recognizing that, however, New England is rapidly forging ahead in profiting from cooperative effort.

Business individualism invites outside competition. Better organized industries from other sections of the country come in and take away from local firms the business that belongs to them by right of territorial location. That has happened in every backward section of the country. Of course, this is a sad situation, but there is a way to profit from it. We realize that if we would successfully combat these newer forces in business we must cooperate one with another. We must join together in trade associations, we must foster our cooperative tactics, forget our dignity and help each other to fight for that business which is rightfully ours.

CHARLES N. FITTS, of the New England Structural Steel Co., and President, American Institute of Steel Construction

Cooperation Does Not Mean Price Fixing

Through cooperation, competitive business units do not expect any longer to frustrate the spirit of the anti-trust laws. Efforts to fix prices or to restrain trade are foreign to their thought, and purely selfish interests are lacking to a far greater degree than the public would be led to believe. But because competitive units may not agree upon prices or divisions of markets is not denying that there is tangible profit in cooperative endeavors which are legal and ethical.

As a matter of fact the courts have decreed that trade statistics, upon which good business judgment can be based, may be gathered through cooperative effort and may be disseminated by a trade association. We can measure our markets and our stocks, even though we may not mutually determine prices. We may jointly develop new markets for our product, conduct research, advertise, hold patents, review legislative enactments and bills, petition Congress and jointly agitate for equable rates and tariff protection.

It is not strange, therefore, that we today witness trade associations of various sizes and of various kinds. The American Bicycle Manufacturers' Association has a present membership of six, while the American Bankers' Association has 21,000 members. Some are more concerned in the elimination of waste in marketing, whereas others are more concerned with excess plant capacity.

Never before in our history, the Department of Commerce has noted in its latest report on trade associations, has there been such a general willingness on the part of individuals and private organizations to unite in working for the constructive upbuilding of our commerce and industry through greater efficiency of each group of related interests. The exchange of ideas and knowledge among competitors, which would have been considered commercial suicide at the beginning of the present century, is now deemed mutually beneficial and constructive—a distinct contribution to higher business ethics.

Steel Industry Cultivating Consumer Markets

Take the steel industry, with which I am better acquainted, as an example. We have the American Iron and Steel Institute, a parent group of the steel mills, concerned primarily with the collection and dissemination of statistical information. There are some other branches of the hot steel industry organized, and a few of these, notably the Flat Rolled Steel Manufacturers, are actively engaged in market development upon a broad scale by research and advertising. In conjunction therewith we have numerous organizations of the fabricators of products from steel. The members of these organizations are really consumers of the output of the mills, but they also—like the American Institute of Steel Construction—are interested in promoting consumer markets for steel products.

In some ways the steel industry is supplied better with organized effort than others; yet I must confess there is much room for improvement. We are able to maintain active organizations in this industry because the out-

standing leaders are fully aware of the practical results that can be achieved. James A. Farrell, president of the United States Steel Corporation, in a speech the other day, said: "Any efforts designed to promote new uses of steel products or to expand their present usage, to assist both the manufacturing and consuming trade to a better understanding of the problems of initial manufacture and remanufacture, are worthwhile."

Promotional Efforts Must Be Honest

We, in the steel industry, look to Mr. Farrell as a leader, for we realize that few men in the business know so much about steel as he does. That is probably pretty generally acknowledged also outside the steel industry. In view of that fact I want to call attention to some remarks made by Mr. Farrell before the Flat Rolled Steel Manufacturers which escaped the attention of most of the newspaper editors of the country. These remarks should be carefully studied. He said:

> Remedies for any ills affecting our business are in our own hands. For instance, the orgy of excessive claims for the superiority of products differing but slightly, if at all, from those of other manufacturers, has assumed fantastic proportions. It incites competitive and expensive effort along similar lines by all competitors, with a mass of assertions and refutations which in the end merely serve to confuse the mind of the buyer or promote harmful conflict among manufacturers.
>
> If this is intended to be a challenge as to the lengthiest pocketbook in advertising achievement and promotional publicity, the challenge will, of course, be met by the interests who naturally resent insinuations as to the superiority of competitive product or the inferiority of their own.
>
> It is in effect a form of salesmanship universally abhorred, of decrying the wares of a competitor, or vaunting unfounded or unprovable claims of excellence of products whose chief merit may be in the assumption of a peculiar or meaningless name.

Many businesses have been ruined by the circus antics of competitors. Many an industrial reputation has been blackened by slander. Competent trade organizations are putting an end to such shameful tactics and we are beginning to realize that there is profit to us individually to bring them to an end. Structural steel is not alone in having suffered through unwarranted attacks by competition, or the unwarranted claims of superiority of other materials. Cotton, brass, coal and many other industries have been similarly deeply and unjustifiably injured.

False Claims Stopped by Ethical Codes

Of course, not all trade organizations came into existence merely to offset the inroads of competitive industries. Yet most of them have profited by the experiences of those that did. And the result is today we have established a code of ethics for competition, very largely put an end to false claims of salesmen, and stopped the circus antics of advertising and publicity.

An industry may gain a temporary advantage through leading the public into accepting a false estimate of its superiority. But that advantage is not long-lived, and the reaction is much more severe than were the gains previous thereto. The more truth we can put into our advertising and publicity, the more stability will we give our industry. Better business bureaus have sprung into being in every commercial city in the United States. They would have been impossible had not industries organized and through cooperative effort attained a better education of their duties and their obligations. The impetus this work has been given will carry the standards of ethical trading far beyond anything we can conceive of today.

> "WE can measure our markets and our stocks, even though we may not mutually determine prices.
>
> "We may jointly develop new markets for our product, conduct research, advertise, hold patents, review legislative enactments and bills, petition Congress and jointly agitate for equable rates and tariff protection."

The gold rivet story of the steel erector is a relic of the wooden nutmeg days. It has been a favorite with the press agent to commemorate an important structural job by saying a gold rivet was driven, whereas the facts were exactly contrary. Gold is too soft; it could not be used as a rivet. What actually occurs is that a regular steel rivet is gilded and displayed for the advertising satisfaction it affords. It is a harmless fake and probably the public cares little about it. But it is a successful fake palmed off on newpaper editors and should be stopped. Harmless as it may be to the public, it is injurious to the individuals in the industry, for it tends to encourage them to indulge in falsehoods in other regards.

New Business World in the Making

In days gone by it may have been possible to sell wooden nutmegs with impunity, but that was before the time of cooperative efforts on the part of trade associations. "Through group effort of business men," the Union Trust Co., Cleveland, recently declared in a published advertisement, "a new business world is in the making."

Trade relations and arbitration in commercial disputes are tending to do away with trade abuses and unethical practices. "For business success," the Equitable Trust Co. of New York stated in a paid advertisement, "a man must look beyond the confines of his immediate problems and keep abreast of his whole industry."

The majority of business executives are alive to the situation and appreciate the tendencies of the times. Even though they may happen to be so blind as to deny the practical benefits of cooperative effort, they cannot overlook the attitude of their bankers toward organization work. Every industrial unit is dependent upon his banker for capital and current cash. He would keep his credit impeccable. But it is difficult to do so and not join his trade association.

Wall Street has been engaged in some large financial operations in recent years. Stock listings on the "big board" have doubled since the war, and most of this represents new issues. I seriously doubt whether industrial units could have been accommodated so easily had the old days of ruthless competition and stiff-backed individualism continued. I doubt whether the public would have advanced its money to capitalize industries which refused to join in cooperative efforts calculated to promote better business conditions.

Trade association membership is really a talisman of a modern successful business.

"Lack of Responsibility Jeopardizes Scrap Trade"

The problem of costs in handling scrap iron and steel was discussed at the dinner meeting of the St. Louis chapter of the Institute of Scrap Iron and Steel, at the Lennox Hotel, St. Louis, Oct. 9. B. P. Williams, of Hickman, Williams & Co., president of the chapter, presided.

"At the bottom of many of the difficulties of the industry is a lack of responsibility," declared Benjamin Schwartz, director general of the institute. "The dealer who scrambles for scrap with the idea of showing a tonnage record, and without consideration to costs or profit, is not only injuring himself, but is engaging in unfair competition and is endangering the future of the industry. The dealer who 'doctors' hydraulic bundles or cars of scrap is not only eliminating himself, but is putting a stigma on the rest of the trade, and is menacing legitimate markets of others. The dealer who, through lack of interest or carelessness, allows accidents to occur in his yard, which could be prevented, is not only increasing his own cost of compensation insurance, but is hurting the rest of the trade, because that preventable accident is marked up against the industry in his State, with a certain increase in the basic rate for all the dealers.

"This lack of responsibility is at the root of many of the troubles in the scrap iron industry. If it is at all within the power of the printed and spoken word, the institute intends to organize a public opinion within the industry that will have to be reckoned with by every dealer who has been operating in entire disregard of the effects on his competitor and the rest of the industry."

Band Saw Handles Two Jobs Simultaneously

TWO jobs may be handled simultaneously, one on each side, on the metal-cutting band saw illustrated, which has been brought out by William Laidlaw, Inc., Belmont, N. Y.

Although designed for production work, the machine can be used economically where a variety of sizes and shapes are to be cut, and is adaptable to special cutting. An example of the latter is cutting of tools that require both rake and clearance. These tools can be cut in double lengths, from nested bars, on one side of the machine; then by using a special fixture the double length can be cut in two at a compound angle on the other side of the machine, the correct rake and clearance being thus obtained without further machining. The machine, designated as the type C.M.T., is heavy and rigid, and has capacity for cutting 12 x 12-in. bar stock.

A unique feature of the machine is that while the saw is in the center of the vises and carriages, rather than on one side as in the usual practice, either side can be set quickly for cutting at any angle, and an automatic stop prevents the saw from cutting into the vise should the operator be away from the machine when the cut is finished.

The tables swivel to permit cutting of long pieces on either side without interfering with the work on the opposite side of the machine. Pieces up to 30 in. long can be cut without twisting the saw on either side; for pieces longer than 30 in. a twist of only 15 deg. is necessary. It is claimed that having the saw run without twist the greater part of the time results in better work and an appreciable increase in the life of both the saw and the saw guides.

Quick - acting vises requiring no wrenches are mounted on heavy carriages supported on steel balls that travel in accurately machined ways. Carriages are held downward by annular ball bearings contacting a special inverted way with an adjustment for taking up wear. A downward work clamping device is also provided. These two features are said to prevent either the work or the work-holding members from raising upward on the left, or up-cutting, position.

The two 30 in. x 1½ in. disk band wheels are a combination of cast iron with steel disks on each side, and are light and rigid. They permit the use of a simple guard that extends only around the outer periphery of the wheels and to the cutting point. Saws can be changed without removing the guards. The upper wheel is mounted on cup and cone ball bearings.

The power unit, consisting of motor, speed-reducing gears and four-speed sliding gear transmission, is mounted on a plate in the base of the machine. The entire unit is ball bearing and all gears and bearings run in oil. All parts are doweled to assure correct alinement. A large door on each side of the machine permits access to the various parts and the arrangement is such that the base plate with all parts mounted on it can be removed from the frame castings as a unit. Speed changes are made by means of a shift lever that extends up through the frame casting to the operating position.

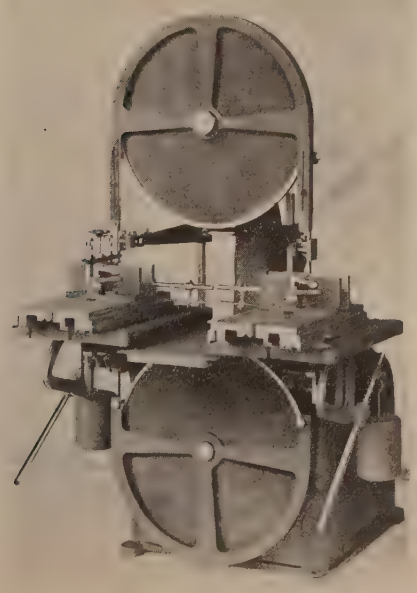
Large Bars and Billets Cut on Vertical Saw

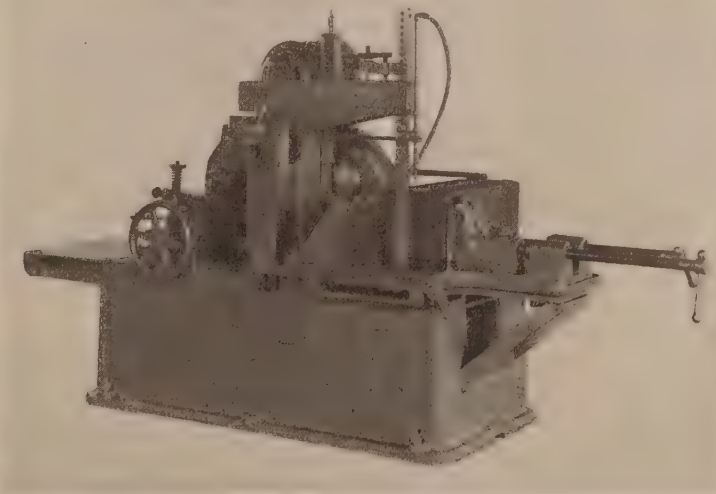
THE Peerless Machine Co., Racine, Wis., has brought out a heavy-duty vertical metal sawing machine having a capacity of 14 x 16 in. The machine is intended for cutting large bars and billets, which can be placed on or removed from the table by an overhead crane. The vertical position of the blade also makes possible the application of a stream of coolant at the top of the cut. The blade automatically relieves itself on the non-cutting stroke, and at end of cut the machine is automatically tripped out.

A roller device is built in each side of the work table so that when a large bar or billet is placed thereon the operator by the use of a handle can raise the piece of work, where it will remain until he has rolled it to the point where it is desired to be cut. Then by lowering the handle the stock rests on the table. Each of the front vise jaws is arranged with hardened steel serrations to prevent shifting of the stock.

The pressure mechanism by means of which the blade is fed into the work includes both a positive and compensating feed, the positive feed being provided with a safety device to prevent the blade from breaking when it becomes dull. Ball bearings are used throughout the machine, and the transmission runs in oil. Three speeds are obtainable, and a trip can be set to cut out the machine at any given distance within its capacity. Saw blades from 17 to 24 in. long can be used. The machine is driven by motor and chain. It is 10 ft. long, 4 ft. 4 in. wide and 4. ft. 9 in. high. The weight is approximately 4500 lb.

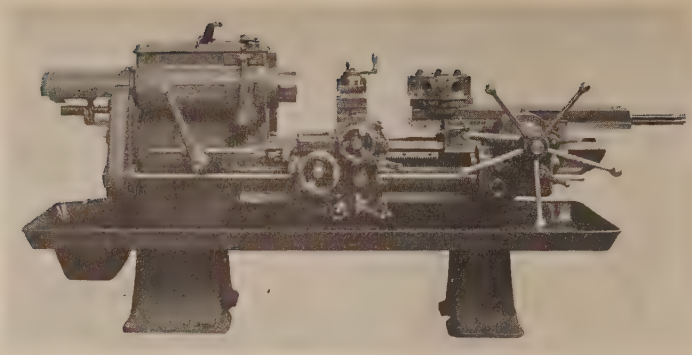
Freyn Engineering Co., Chicago, has been engaged as consultant by the Otis Steel Co., Cleveland, in the remodeling of the No. 2 blast furnace plant at the Riverside Works of the Otis company.





The Metal Cutting Band Saw, at the Left, Is Designed to Permit Handling Two Jobs Simultaneously. The saw blade runs without twist except when cutting unusually long pieces

In the Vertical Sawing Machine Above, Large Bars and Billets Can Be Placed and Removed by an Overhead Crane



Universal Turret Lathe with New Features

A TURRET that is clamped and unclamped automatically is an outstanding new feature of the No. 4 universal turret lathe recently brought out by the Gisholt Machine Co., Madison, Wis.

A bevel clamp ring, operated by an eccentric toggle, is opened and closed automatically by the backward and forward travel of the turret slide. It binds the turret rigidly to the slide, with no increase in the effort needed to move the slide. Two movements per station, or 12 movements where a full set of tools are used, are thus saved for the operator and damage and loss of accuracy arising from failure to clamp the turret tightly to the slide after indexing is eliminated. The entire strain of the cut is taken by the bevel clamp ring, the locating pin and bushings having only to position the turret. A protected positive gib lock keeps the turret slide in alinement. The stop roll, of new design, permits adjustment to 0.002 in. between the automatic feed trip and the dead stop.

Twelve spindle speeds, from 28 to 751 r.p.m. are obtained selectively through sliding gears and a positive jaw clutch. A single lever controls the starting, stopping and reversing of the spindle through a multiple disk clutch. A brake is applied automatically in the neutral position of the control lever and a special safety latch prevents accidental starting of the spindle. Hardened alloy steel gears mounted on spline shafts, tapered roller bearings for the spindle and drive shafts and centrifugal lubrication of all gears and bearings are features of the headstock. Speed change levers seat firmly and are positive in position. The machine is driven by 3-hp. 1200-r.p.m. motor through Texrope belts and balanced drive pulley, the motor being mounted on the rear of the headstock leg. It is claimed that speed rating may be doubled without damage to bearings or clutches.

Automatically indexed square turret is another feature. The square turret is mounted on the front of the bridge-type cross-slide. It indexes automatically with the release of the clamping lever, permitting the operator to use his right hand for indexing and clamping while his left hand positions the carriage for the next cut. An auxiliary tool-holder may be mounted on the rear of the cross-slide for the cutting off or for use of taper attachment. The carriage moves on hardened steel ways with apron bearing on the bottom of the bed. Apron parts run in oil, and a hand-operated pump is provided for lubricating the bed ways, cross-slide and cross-feed screw. Taper attachment and threading attachment supplied as extras.

Specifications are:

Automatic chuck capacity, round stock 2 in.; hexagon stock, 1¾ in. and square stock, 1 7/16 in. Swing over ways, 19¾ in.; swing over cross-slide wings, 17¼ in., and swing over cross-slide, 10¼ in. The maximum distance from the face of the turret to the end of the spindle nose is 31 in., the longitudinal travel of the hexagon turret is 14 in., the swing over the turret slide is 7⅝ in., the longitudinal travel of the cross-slide is 26 in., and the cross travel of the cross-slide is 10⅞ in.

Floor space occupied is 40 x 99 in. and the length of the bar feed beyond the pan is 38 in. The net weight of the machine is 3450 lb.

Centrifugal Oil Extractors, Washers and Dryers

STURDY construction, minimum of vibration and safety of operation are features of an improved self-contained motor-driven centrifugal oil extractor which is being marketed by the Leon J. Barrett Co., Worcester, Mass. Extraction of 90 to 95 per cent of the cutting oil from saturated chips is claimed. It is estimated that 100 lb. of average chips pick up 3 gal. of oil; 1 gal. of this oil may be recovered by draining overnight and practically all of the remaining 2 gal. may be recovered in 2 to 3 min. by the centrifugal extractor.

The starting lever is interlocked in the neutral position so that the machine cannot be started inadvertently. The lid of the extractor is a semi-steel casting and is balanced to facilitate raising and lowering. The arrangement is such that to operate the machine the lid must be closed and locked, and when the lid is locked all moving parts are inaccessible. The starting lever is arranged to prevent unlocking while the machine is in operation, either in the running or braking position. Unlocking the cover shuts off the current automatically. The machine is available with either hand chain or hydraulic hoist.

Cyclone dryers for the rapid and complete drying of washed metal parts are also built by the company. Air under room conditions is drawn in and forced through the contents of the machine, entering through a dehumidifier in the cover containing electric heating coils. The heating and expanding of the air occurs at the point of entrance; drying is effected, first, by expelling the surplus moisture by centrifugal force; and second, by absorbing the remainder by the rapid swirling current of heated air.

Self-contained Typhoon metal parts washers are also manufactured. In the center of the pan there is a cone having a series of holes in the upper part but with the bottom open. The parts to be washed free of grease, oil, soda, alkali or acid are placed in the pan and brought up to speed. Water or other fluid, under valve control, enters the central column and passes through the holes in its side wall, due to centrifugal force, and thus the impurities from the inner side of the load are carried to the wall of the pan. A much larger quantity of water passes down through the opening of the bottom of the cone, up the sloping side with continually increasing velocity, flushing out all the impurities that may have become washed to or collected along the wall. The supply valve is then shut off and in a few seconds all the water is thrown off from the parts in the pan. A strong suction is caused by the rotating bowl, and the air rushing in and through the parts in most cases dries the product. A heating or dehumidifier grid may be applied.

Reclaiming of 90 Per Cent of the Oil from Chips Is Claimed

Notable Progress in Steel Research

Pittsburgh Group Studies Manufacture of Clean Steel and Iron Alloys of High Purity

STANDING room was at a premium at the afternoon session of the third open meeting of the Metallurgical Advisory Board to the Carnegie Institute of Technology and the United States Bureau of Mines, held in Pittsburgh Oct. 18. About 250 prominent metallurgists and research workers from all sections of the steel industry crowded the auditorium at the Bureau of Mines, and listened to the reports on investigations now in progress at the two institutions. A five-year research program was initiated in 1926, and in the intervening three years some $150,000 has been spent, of which $55,000 has been contributed by 43 steel companies in the Pittsburgh district. The work is gaining momentum constantly; 30 men are now engaged, nine on the Bureau of Mines staff, six of Carnegie Institute's faculty, seven research fellows, and eight employees of the Advisory Board, four of the latter being engaged in plant research. F. N. Speller of the National Tube Co., chairman of the Advisory Board, praised the active cooperation by operating officials of the several steel companies where open-hearth steel making reactions are being studied on a grand scale.

Quantitative Estimation of Slag Inclusions

Dr. C. H. Herty, Jr., physical chemist of the United States Bureau of Mines, has been giving his entire time since the beginning of the investigation to a study of the non-metallic inclusions in steel, with particular reference to the underlying chemical reactions between metal and slag in an open-hearth furnace and to the conditions responsible for "dirty" steel. Laboratory studies in connection with this problem have included the solubility of iron oxide in steel and various kinds of slag, the effect of commercial deoxidizers on these solubilities, the viscosity of slags at various temperatures, the chemical and microscopical identification and analysis of inclusions and gases in steel.

Lack of precision in the last mentioned items has hampered the progress of the work, and especially the correlation of data gained from open-hearth heats to the theoretical results of laboratory findings. The high spot in Dr. Herty's report, therefore, was the announcement of the discovery of new methods for measuring the amount of sonims contained in steel. These new methods have been used in re-analyzing and re-computing some old data, and have served to explain former unexplained and puzzling discrepancies.

In the study of deoxidation by silicon, for instance, it was known that the best chemical method for determining oxygen in steel was inaccurate in the presence of much silicon or manganese. In order to get some more accurate data, polished samples of the steel were examined for inclusions under a micrometer microscope; each globule was measured and classified as to its nature (whether glassy type containing about 80 per cent silica, the intermediate type, or the "F-type" with about equal amounts of silica and iron oxide). Duplicate slag counts of this sort made on various planes through a metal sample, gave remarkably concordant results. In over 120 samples there was also found much more visible oxygen than given by chemical analysis—60 per cent excess at times.

This new method of visual determination, and a new electrolytic method of segregating non-metallic inclusions, form not only a new basis of appraising past work on slag-metal reactions, but also will be used in future work on the synthesis of inclusions in the laboratory and their identification in steels.

Deoxidation of Steel with Silicon

Plant studies on the deoxidation of steel with silicon started three years ago. Complete data on several heats from 40-ton, 90-ton and 250-ton furnaces have been obtained. Heats would be worked down to 0.10 to 0.14 per cent carbon and 100 lb. of silicon added to kill the metal; the bath would then be reboiled, and in about 30 minutes would be tapped, adding manganese only in the ladle. Frequent samples were taken at all stages, and Dr. Herty concludes from all the studies that silicon so used, alone in the furnace, produces steel no cleaner than other heats made without it, so the added ferroalloy and the time required are wasted. While it deoxidizes the bath temporarily, it does not eliminate the glassy silicates formed. Silicon and manganese both are needed for cleansing action, and studies on this practice are now being pushed so intensively that results should be available within the next year. Proper deoxidation and cleanliness require big inclusions of the F-type, which will be rapidly eliminated. Later reoxidation from the slag may be prevented by increasing the viscosity of the slag or skimming it at the end, or by lowering the iron oxide in the slag as much as possible without rephosphorization.

Effect of Sonims on Seamless Tubes

Forty-three heats of steel designed for a seamless tube mill were studied, especially the relationship between slag inclusions and chipping costs and the physical properties of the finished steel. Full results are to be published soon, but it may be said that chipping costs and workability of the pipe steel is related to so many other factors than sonims that unless the latter are unusually numerous no specific influence can be noted. However the strength, elastic limit and ductility of the metal (both in longitudinal and transverse directions) are adversely affected by increase in "dirt."

Standards for Abnormal Steel

Of the many important offshoots of the main investigations outlined briefly above may be mentioned studies by Dr. V. N. Krivobok and his associates at Carnegie Institute of Technology into the reasons for random grouping of crystal aggregates after carburizing. At the outset it was endeavored to set up standards of comparison for so-called "normal" or "abnormal" steel (as defined by the McQuaid-Ehn test). For this purpose some oxygen-free iron from a vacuum fusion was carburized, and a pearlitic structure was found which contained but little granulated cementite—a structure neither abnormal nor normal. Further investigations indicated two types of abnormality, (a) structural abnormality involving segregations of cementite and (b) grain size abnormality involving non-uniformity in size.

Certain factors were found to influence the structural type of abnormality; for instance, manganese in steel makes for normality; the rate of solidification in the ingot and the rate of cooling from the carburizing furnace also have an influence. Oxygen in the steel as iron oxide undoubtedly promotes structural abnormality; if such a steel is deoxidized by aluminum or silicon the structure is like carburized pure iron, i.e., neutral.

Grain-size uniformity is promoted by the carbon originally in the steel. Manganese coarsens the carburized grain.

The effect of sub-microscopic inclusions is still doubtful, as all steels are believed to have such particles; normal carburized microstructures have been found in steels certainly full of them.

Pure Manganese and Manganese-Iron Alloys

A considerable quantity of pure manganese (spectroscopically free of silicon and aluminum) has been made by distillation, as described in THE IRON AGE, Dec. 13, 1928, page 1499. When alloyed with pure iron, and melted in special equipment to prevent contamination by oxygen or other elements, the resulting steels containing 0.2 and 0.4 carbon and 7 and 10 per cent manganese are remarkably tough. They have a hardness of 37 to 45 Rockwell C and harden quickly on cold work. Hardness, however, is little affected by hot forging or by heat treatment. Thermal analysis shows no critical points. The microstructure develops Widmanstattian markings, the more pronounced as manganese increases. This structure is explained on the hypothesis of two distinct solid solutions.

Studies are also being continued of the commercial cast manganese steels of the Hadfield type. It has been found that the microstructure and critical temperatures of such alloys may be changed materially by preliminary

heat treatments, and an effort is being made to intensify this effect so that steels of unique properties may be produced.

Studies on Alloy Steels

Another side line of investigation concerns the development of steels made with alloys produced in the United States which may be substituted for others made with imported metals. Related to this is the study of special analyses for extra severe duty, either at high temperature, high pressure or in corrosive atmospheres. A preliminary exploration was made of the chromium steels containing 0.10 to 0.60 per cent carbon and 16 to 35 per cent chromium—a field which is relatively unknown. Microscopic and thermal analyses have developed a provisional equilibrium diagram showing four constituents, one of which is new. All the findings are in accordance with the assumption that chromium is an element which stabilizes alpha iron and restricts the formation of the gamma configuration.

On account of the interest in the so-called 18-8 stainless irons, a considerable quantity of a pure iron-chromium alloy containing 18 per cent chromium will be manufactured, and with this as a basis a series of alloys containing increasing additions of carbon and nickel will be made and the physical properties studied, especially at high temperatures.

T. M. Girdler to Join Eaton-Mather Group

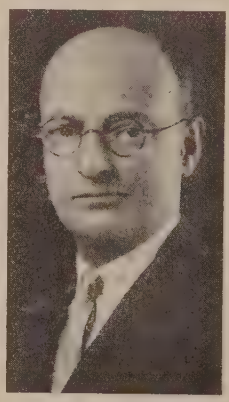
Jones & Laughlin President Resigns—Will Be Actively Engaged in Plans for Merger of Steel Companies

T. M. GIRDLER, president of the Jones & Laughlin Steel Corporation, has resigned that position to become associated with the Eaton-Mather financial interests of Cleveland. This group, headed by Cyrus S. Eaton of Otis & Co., Cleveland investment bankers, is said to be one of the largest owners of steel company stocks in the country. Most of these stocks are owned by two holding companies, Continental Shares, Inc., and the Cliffs Corporation, which are affiliated with Otis & Co.

Mr. Girdler's association with the group, according to the official announcement, is regarded "as an indication of other important steps to follow." It is stated that Mr. Girdler will not be connected in an executive capacity with any of the steel companies in which the Eaton-Mather group is interested, but will be actively engaged in "the development of plans affecting the iron and steel industry."

It is officially said that the selection of Mr. Girdler is a forerunner of the announcement of a large merger of independent steel companies. No intimation is given as to what companies will be put together in such a merger, though it has been generally assumed in the steel industry that the Republic Iron & Steel Co. will be prominent because of the large interest of the Eaton group in that company. Mr. Eaton is generally credited with being responsible for the acquisition by the Republic company of the Trumbull Steel Co., Warren, Ohio, and Steel & Tubes, Inc., Cleveland.

Companies in which Continental Shares, Inc., and the Cliffs Corporation are financially interested include the Inland Steel Co., Central Alloy Steel Corporation, Otis Steel Co. and Donner Steel Co. The Cliffs Corporation some months ago acquired complete ownership of the Cleveland Cliffs Corporation through an exchange of stock. Cyrus S. Eaton is a director and member of the executive committee of the Republic company and a director of Inland



T. M. GIRDLER

Steel Co. and the Central Alloy Steel Corporation. William G. Mather, with whom Mr. Eaton is now closely associated, is chairman of the board of the Otis Steel Co. S. Livingston Mather is a director of Otis Steel.

Mr. Girdler will enter upon his new duties Nov. 1. No successor has yet been named by the Jones & Laughlin Steel Corporation. Mr. Girdler's new official connection will be as a partner in the banking firm of Otis & Co. He was elected president of the Jones & Laughlin company on Jan. 12, 1928. He was graduated in mechanical engineering from Lehigh University, Bethlehem, Pa., in 1901, and immediately became associated with the Buffalo Forge Co., Buffalo, N. Y. Shortly afterward he was sent to London, England, as sales engineer and assistant to that company's London representative.

In 1902 Mr. Girdler returned to this country to become identified with the Oliver Iron & Steel Corporation, Pittsburgh, remaining with that company until 1905, when he went with the Colorado Fuel & Iron Co., Pueblo, Colo. Two years later he became general superintendent of the Atlantic Steel Co., Atlanta, Ga., remaining with that company until 1914, when he joined the Jones & Laughlin company as assistant to the general superintendent of the Aliquippa works, Woodlawn, Pa. Later he was successively assistant general superintendent and general superintendent of that works and general manager of all plants and properties of the company. He was elected vice-president and a director of the company in 1925, holding that position until his accession to the presidency.

Merger of Screw Machine Products Organizations

A merger of the Screw Machine Products Association with the Screw Machine Products Institute was officially authorized in Chicago on Thursday, Oct. 17, at a meeting of the former organization. About a year ago a survey of the screw machine products industry was made by Dr. Arthur E. Swanson. Upon his recommendation the Screw Machine Products Institute was set up among members of the association to work out certain policies and plans centering largely around cost studies. This has now progressed to the extent that it was felt that all of those in the association should share in the benefits to be derived and, as a result, the institute takes over the activities of the former association. Dr. Swanson, who has been director of the institute since its organization early this year, continues as director. The management is in the hands of the officers and directors of the former association. Group meetings are planned for the future.

Loan Made for Two Ships; 22 Boats to Be Scrapped

WASHINGTON, Oct. 22.—The Shipping Board has approved a loan to be used by the Oceanic Steamship Co., San Francisco, in aid of constructing two 11,300 deadweight tonnage, combination passenger-cargo vessels, the contract for which has been drawn up by the Bethlehem Shipbuilding Corporation. According to the board, it is expected that the ships will be built at the Fore River yard at Quincy, Mass.

The board also has announced the sale of 22 laid-up vessels to the Union Shipbuilding Co., Baltimore, with the understanding that the vessels will be scrapped. The vessels were sold for $335,000 cash.

Gray Iron Institute in Annual Meeting

A Cost System Adopted—Research Plan Outlined—Scheme for Certifying Castings Recommended

A PLAN for adopting standards of quality for gray iron castings and for certifying castings that come up to the standard was recommended to the Gray Iron Institute by its president, Walter L. Seelbach, at its second annual meeting held at the Hotel Cleveland, Cleveland, Oct. 16. This certification would be a guarantee of quality. Members would be allowed to use the seal and trademark on their products after safeguards in the way of tests had been provided to give assurance that the castings were up to the adopted standards of quality. These tests would be made by recognized laboratories in the various districts.

Mr. Seelbach said that it is difficult to work out a method of certification, but he believed the problem could be solved. Included in the suggested plan would be the carrying out of a publicity program by means of which he believed the public would come to accept certified gray iron castings.

The adoption of a cost system was announced and this will soon be issued in pamphlet form. Reports of various other committees indicated that the institute has accomplished a great deal of work during the past year and has much under way. Speakers expressed the feeling that the gray iron industry is in a much more favorable position than a year ago, that the merits of gray iron castings are being more generally recognized and that the competition of other products as substitutes for castings has been largely reduced.

Growth of Institute Satisfactory

The institute has enjoyed very satisfactory growth the past year, but still needs additional members to aid in carrying out the work it has undertaken. Starting with a membership of 40, it had 83 members at the annual meeting a year ago and its present membership is over 200. The registered attendance at this year's meeting was 119, representing 19 States and Canada. Eighty-two member companies and 42 cities were represented.

Four new directors were elected for a three-year period. They are as follows: J. D. Coltman, Bullard Co., Bridgeport, Conn.; William J. Grede, Liberty Foundry, Inc., Wauwatosa, Wis.; E. H. Williams, Vulcan Mold & Foundry Co., Latrobe, Pa., and R. M. Hill, East St. Louis Castings Co., East St. Louis, Ill. The old officers were reelected. They are:

President, Walter L. Seelbach, Forest City-Walworth Run Foundry Co., Cleveland; vice-presidents, B. H. Johnson, Florence Pipe Foundry & Machine Co., Florence, N. J., and A. E. Hageboeck, Frank Foundries Corporation, Moline, Ill.; treasurer, H. S. Chafee, Builders Iron Foundry, Providence, R. I.; assistant treasurer, H. C. Wilson, Cleveland, Cooperative Stove Co., Cleveland, and manager, Arthur J. Tuscany.

Industry's Present Status Improved

The gray iron industry presents a different picture from that of a year ago and, through the work of the institute, a good name has been established for gray iron castings, declared President Seelbach in his annual report. The industry was threatened a year ago, he said, with encroachments by other products. He summarized the work accomplished during the past year. The working out of a uniform cost system, he believes, will solve the problem of getting fair prices. New uses should be found for gray iron castings rather than trying to compete for products for which other materials are better suited.

Conditions that led to the formation of the institute early in 1928 were reviewed by Manager Arthur J. Tuscany, who declared that the gray iron industry had found it necessary to organize for its own protection. The institute, he said, has made a good start in showing the importance of gray iron. It has created a more favorable attitude on the part of the public in general and of casting buyers toward castings. Gray iron has advanced and is now shown at its true worth.

Reviewing the various activities of the industry during the year, Mr. Tuscany said that through its efforts the gap between excess production and consumption had been reduced. Some consumers of castings had been shown that it would be more economical for them to buy castings outside than to operate foundries and in other cases the building of excess foundry capacity has been discouraged. He referred to the adoption of the cost system as an important achievement of the year. While a fair start has been made along various lines, Mr. Tuscany pointed out that there is yet much to be accomplished. The report of the treasurer showed that the institute is in a healthy financial condition, its receipts during the year having been well above expenditures.

A Cost System Adopted

The report of the cost committee was submitted by its chairman, J. L. Carter, Sacks-Barlow Foundries, Inc., Newark, N. J. He said that a standard cost system and a general accounting system were among the most important needs of the industry. The aim of the committee was to develop a cost system applicable to both large and small foundries and in their work the members were assisted by many practical foundrymen, as well as expert accountants. Various systems were studied, and the committee attempted to pick out the best features of each.

Systems studied were found to be largely similar except as to the methods of determining cleaning and shipping costs. The committee found the most difficulty in arriving at a method for determining cleaning costs. It made actual studies of various methods and found that often foundrymen guessed at their cleaning costs. The committee held that the only satisfactory method of figuring cleaning room costs was by basing these on the direct labor of cleaning, together with indirect labor costs. There would be valid objections if uniform labor charges were applied to all kinds of jobs. This difficulty, however, will be solved by so carrying cleaning costs that actual costs can be figured on special jobs. In the opinion of the committee many leaks would be stopped by the adoption of the system.

The second objective of the committee is to induce foundries to adopt the cost system. Mr. Carter favored the holding of local group meetings of the foundrymen at which the system would be explained. An experienced cost accountant will usually be required to help place the system in effect. The institute would supply expert accountants for that purpose. The cost committee also reported that it had extended its work to include a system of uniform accounting.

The finance and budget committee, through its chairman, Howard O'Neil, Western Foundry Co., Chicago, reported that the institute has sizable funds available for continuing its various activities during the coming year.

Standard Sales Agreement Developed

The merchandising committee through its chairman, Don McDaniel, Decatur Castings Co., Hamilton, Ohio, reported that the committee has developed a standard sales agreement and trade customs and, in addition, has prepared various pamphlets which have received favorable comment. A number of problems confront the committee, he said. Facts developed by the research committee should be presented to buyers of castings. Mr. McDaniel felt that a survey of the gray iron industry is needed and that a survey should also be made of some one outstanding industry in other fields, believing that such a survey would be of value in solving the merchandising problems of the gray iron foundries. An important task of the institute, he said, is to sell the organization to buyers of castings. The seal of the institute should be made to mean something, and he believed a suitable slogan should be developed and that a technical department should be established to show where gray iron should be used. Mr. Seelbach, commenting on reports, said that the merchandising committee had the hardest job of all the committees.

Plan of Research Outlined

The research committee through its chairman, B. H. Johnson, reported that it had studied the work of other organizations and had endeavored to set up a program to show what has been done and is being done along the

line of research work. A plan was briefly outlined for making tentative recommended practices for certain gray iron castings. Under the plan 25 foundries will be selected from which test bars will be secured and tests will be made and the results tabulated. Information will also be secured as to cupola practice, mixing, etc. This investigation will lead to standard specifications for certain classes of castings and engineers will be supplied with these specifications. The association will keep the specifications up to date. The committee will cooperate so far as it is able with the Engineering Foundation in research work in alloy iron and steel.

The statistical committee, through its chairman, K. L. Green, Green Foundry Co., St. Louis, reported that 115 members are making monthly trade reports but the number should be increased. Mr. Seelbach said that he carefully studied these reports and found them valuable in his business.

Mr. Tuscany presented the report of the trade practice committee for R. M. Hill, chairman. This committee has made a study of conferences held in other industries with a view of determining how conferences would help the gray iron industry. The committee had decided to make further investigation before determining the character of conference that would be best suited for the gray iron industry.

Members will be allowed to use the institute's seal on their castings or stationery on securing permission from the executive committee under a change voted in the by-laws.

Trade Associations Important Factors

The business sessions were supplemented by an interesting program of three speeches on topics that appealed to the gray iron foundrymen. At a group luncheon meeting a talk was given on the business man and his trade associations by Dr. Hugh P. Baker, manager of the Trade Association Department, Chamber of Commerce of the United States. Trade organizations, he predicted, will become more important factors in business than at present. Bankers, he said, are looking with favor on membership in trade organizations by industrial companies, believing that there is a sounder upbuilding of industries by organized effort. He listed as outstanding problems of industry, overproduction, price cutting, invasion of another's territory, wasteful, harmful practices that lead to unfair competition, lack of standards and nonmaintenance of quality. The speaker emphasized the importance of a sound cost system and the gathering of statistics covering all phases of the industry. Codes of business practice, he said, are helpful but often are not lived up to in periods of depression. Good results have come from trade practice conferences. Trade promotion is an important activity. He urged the foundrymen to sell quality and service.

"The New Day Marketing" was the subject of a talk by R. R. Cunningham, National Sales Development Service, Cleveland. The speaker added a pleasing mixture of humor to his talk, which covered some of the problems of distribution. Declaring that the price is not the only thing in merchandising, he also emphasized the importance of quality and service, which he said was counting for more every day. Long profits are in noncompetitive selling in which the seller is rendering service.

Labor Control Changing

Labor cost control in jobbing foundries was discussed by T. M. Harrison, Stevenson, Harrison & Jordan, New York and Cleveland. He outlined a method of setting molding and coremaking piece rates developed for making wage incentives possible in jobbing foundries despite frequent changes due to short runs. Management and labor control has been undergoing a change, he said. The number of employees that are paid according to time is growing smaller. In foundries a great deal of work is being done on a day rate, because of short runs, on which piece rates could be applied. Often piece rate on such work is likely to be set by a foreman relying only on his judgment. Under the system presented, scientific methods take the place of the foreman's judgment.

Standard Time for Each Job Advocated

The speaker described molding as a combination of various minor operations and pointed out that standards can be established by time studies of these various elements, these being largely mechanical. He demonstrated the system by exhibiting a pattern and describing the method of figuring out the time allowances by taking measurements of the pattern, showing area and cubic contents, taking the cubic contents of the flask, net sand, classification of cores, etc. The data obtained showing standard times for various operations were tabulated, the total being the standard time for the job. For a jobbing foundry he advocated a bonus rather than a piece rate system.

The speaker contended that poor performance in a jobbing foundry is often the fault of the management and not of the molders and that the adoption of a wage incentive system will cause a foundry to be organized so that skilled men will not be doing unskilled work. The system he discussed, he said, would enable a jobbing foundry to predetermine its costs and help eliminate unintelligent competition. He claimed that by using the system a jobbing foundry would make a net saving of over 20 per cent.

The meeting closed with a banquet and entertainment in the evening.

Herberts-Moore Machinery Co., San Francisco, has been appointed exclusive sales agent in northern California and Nevada for South Bend engine lathes made by the South Bend Lathe Co., South Bend, Ind.

Shop Equipment Exhibited at Bridgeport

A WIDE variety of shop equipment and supplies was shown at the second cooperative exposition held under the auspices of the Salesmen's and Purchasing Agents' Association of America, Inc., at the Pyramid Shrine Mosque, Bridgeport, Conn., Oct. 17, 18 and 19.

Gross space of approximately 13,500 ft. was occupied, and more than 125 companies were represented at the 60 or more separate booths. About 50 companies were unable to obtain space, and the taking of larger quarters for the next exposition is being considered. The attendance was in excess of 5500.

All classes of factory supplies, including tool steels and small tools, were on display. Widia tungsten carbide tools were shown by Hunter & Havens, representing Thomas Prosser & Son, New York, and Strauss metal tools were displayed by the Ludlum Steel Co., Watervliet, N. Y. The carboloy Co., New York, demonstrated its tools in connection with a 36-in. Bullard vertical turret lathe. Heppenstall die steel of 0.48 per cent carbon and 0.63 per cent manganese was machined at 190 ft. per min., 5/16-in. cut, and 0.033-in. feed. Bronze bearing metal, copper 85 per cent, and lead, tin and zinc 5 per cent each, was turned at 450 ft. per min., ⅝-in. cut, 0.068-in. feed, the tool holding its edge for a long period. High test iron castings such as used in Bullard machine tools was machined at the rate of 220 ft. per min., ½-in. cut, 0.068-in. feed. This material has a tensile strength of 38,000 lb. and hardness of 207 Brinell.

Displays of chromium-plated products were another center of interest. One company showed chromium-plated files, the plating on which was said to markedly prolong the life of the tools. Another concern exhibited a large chromium-plated roll used in the production of highly finished sheet brass, the plating being applied to resist wear.

Officers of the association are: R. T. Phipps, Bullard Co., Bridgeport, president; W. H. Bradley, Hunter & Havens, vice-president; L. R. Watkyns, Max Ams Machine Co., secretary; and F. H. Braithwaite, Wellington-Kincaid Co., treasurer.

Celebrates Opening of New Plant Addition

To celebrate the opening of its new factory addition, which adds 60 per cent to its production capacity, the Brown Instrument Co., Philadelphia, maker of indicating, recording and controlling instruments, held a company party on Oct. 3. In honor of the event a souvenir program was printed containing a history of the company by Richard P. Brown, president. Organized in 1860 with two employees and an annual business of $16,000, the company now employs 500 people and its sales approximate $3,000,000 a year.

This Issue in Brief

Strategic location of factory lowers cost to consumers. Nine-tenths of all industries are improperly located, investigators estimate. They have been placed where they are, by chance or by rule-of-thumb methods, while keen competition requires manufacturers to seek the lowest possible cost.—Page 1089.

* * *

Material-handling costs are cut by using lifting magnets. Their use need not be confined to handling bulky materials, such as pipe, plate, scrap, etc. They can lift and move boxed parts also.—Page 1097.

* * *

Your repair man should have a lock or warning sign to place on the starting lever of the conveyor before repairing it. Don't let him adjust or repair the conveyor while it is in motion, as the percentage of accidents from this source is high.—Page 1099.

* * *

You can not make a high-strength cast iron merely by introducing alloys into inferior irons. Alloys act simply as an aid to the betterment of a condition. But properly used, it is easy to produce a high-strength iron without special processes.—Page 1101.

* * *

Nitrides large parts in world's largest nitriding furnace, 26 ft. long between doors. Parts are placed in a nitriding box 22 ft. long, mounted on an 8-wheel motor-driven car. A fan located in the box circulates the gas through the work.—Page 1102.

* * *

Low-cost foundry operation is encouraged by use of the proper kind of coke. Therefore, Pennsylvania coke manufacturer experiments and discovers a new process which enables him to make beehive coke comparable with by-product coke, in both physical characteristics and chemical analysis.—Page 1091.

To combat today's competition successfully, manufacturers in the same industry must cooperate one with another. The most efficient means of doing this is through trade associations. Competent associations can discourage unfair competitive tactics within the industry and help fight "outside" competition.—Page 1107.

* * *

When joining thin-walled steel tubes by brazing, beware of high heat. Better keep the brass below 1100 deg. C., for steels which have been subjected to severe cold work tend to recrystallize strongly when subjected to the heat of the brazing liquid.—Page 1103.

* * *

Danger signal of too little or too much heat in hardening bath is given by colored lights connected to pyrometer. This signal enables operator to regulate the introduction of axes into the lead hardening furnace, so that the proper temperature will be maintained.—Page 1095.

* * *

Not much shifting of factories from one place to another. Relocations account for only 10 per cent of growth in number of plants, survey reveals. Great bulk of new industries in any community are *new* local manufacturing businesses.—Page 1090.

* * *

Cleaning costs are often guessed at by foundrymen, survey reveals. Cost committee finds most difficulty in arriving at a method for determining real cleaning costs. The only satisfactory method is to take the direct labor cost, and add indirect labor.—Page 1113.

* * *

Moving messages impress "safety first" on workers' minds. Overhead conveyor bears safety slogan signs, so arranged as to appear about every five minutes at a given point.—Page 1100.

Keeps hardening bath temperature fluctuation within 7.5 deg. Fahr. plus or minus by means of double control instruments, double circuits and switches. In axe plant one circuit is entirely off the recording control pyrometer for the salt bath and is placed on the control pyrometer for the heating chamber.—Page 1095.

* * *

What is "slush molding?" Method used in making zinc statuary can be applied successfully to cast iron. Molten metal is poured into the mold and allowed to stand just long enough so that the desired thickness of metal sets against the mold surfaces, after which the still molten iron is poured out. No core is used.—Page 1096.

* * *

Revamps old motor to provide greater power for larger rolling mill requirements. Size of motor is increased from 5000 to 8000 hp. by replacing armature copper with greater cross-section.—Page 1093.

* * *

Cheap labor may prove expensive in the long run. So many fears about the competition of cheap labor have proved groundless that wise employers generally have come to believe that labor is worth about what one pays for it.—Page 1116.

* * *

Cuts production costs and improves quality of enameled wire by using a vertical-tube electrical furnace. Wire is fed from spools arranged on a suitable rack mounted to the back of the oven. Four coats of enamel are baked on.—Page 1105.

* * *

Adopt a wage incentive system and you will eliminate the waste of having unskilled work done by skilled men. Cost consultant estimates that in a jobbing foundry this system will make a net saving of over 20 per cent.—Page 1114.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

This Year and Next

ALREADY thought begins to turn to the new year —what it will bring in volume of steel demand. Such looking forward is stimulated by recently declining production and the unlikelihood, according to precedent, that there will be an upturn in the remainder of this year. Hope must be centered on next year.

Naturally the first thing to do is to appraise this year, to determine how far it may be used as a basis for the future; and difficulty is at once encountered. This has been an anomalous year. It showed 18 per cent gain in first-half production over the previous record, which is too big a jump to be considered permanent; the peak rate in production came two months later than usual; the familiar summer dip was replaced by a very slow and continuous decrease, and there has not been the usual autumn rise.

One can find in the past no satisfactory parallel for this performance. Statistically, 1923 appears to afford a parallel, for it showed peak production in April and monthly decreases thereafter through December, but marketing conditions were different. That year belonged to the old regime of price advances, forward buying and the carrying of stocks by steel consumers. This year there were no deliveries to be accepted and put in stock to take advantage of old and lower prices. In 1927 the second half was poor throughout. In all other years after 1923 there was a dull summer with an autumn recovery.

Some assistance in gaging this year is gained by a comparison between industrial activity in general and steel production in particular. Was there a divergence in steel, and if so does the divergence promise to be permanent? The Federal Reserve Board compiles a monthly index of industrial production, manufacturing and mining. The board's base is 1923-4-5, and computing ingot production relatives according to the same plan we find that the first eight months of this year ran 16 per cent above the 1923-4-5 relation to industrial production, which seems somewhat suspicious; but going back one finds that 1928 ran 9 per cent high, and that 1927 showed an even balance. Thus the higher proportion of steel production to general activity has some measure of permanence in it, though it cannot be regarded as fully established.

In few lines of steel consumption this year was there anything really unusual or abnormal. Automobile production during the first eight months was phenomenal and line pipe demand was exceptional. But little of this year's demand can be picked out as definitely unlikely of duplication next year. There was, however, an unusual combination of favorable circumstances and these might not all hit together next year.

There is one favorable point for next year. All precedents indicate that each year takes a fresh start, a poor ending of the previous year being no handicap. Apparently if a year ends poorly demand accumulates, while if it ends well the momentum is held and some accretion is furnished. Consulting the statistics, one finds that each of the four years 1924 to 1927, inclusive, had a March peak, with ingot production lying between 161,000 and 170,000 tons daily, whereas the preceding Decembers had shown the following widely different rates: 114,531, 137,279, 152,728, 133,337 tons.

Cheap Labor Not So Cheap

OUTCRIES have been heard recently from certain labor leaders that so much American capital is being invested in European factories that it will eventually mean the importation of automobiles, radios, farm equipment and other products made more cheaply abroad by virtue of cheaper labor, and to the disadvantage of our own workingmen. How such an inflow of products can surmount our tariffs, which so far have protected our industries against unfair competition, and which will undoubtedly be maintained, is not stated.

Without denying that there are combinations of natural resources, climate and over-population which tend to pauperize the inhabitants, it should be remembered that so many fears about the competition of cheap labor have proved groundless that wise employers generally have come to believe that labor is worth about what one pays for it. In our own country, for instance, the presence of a large colored population, first slave, then free, caused grave concern to thoughtful people in both South and North. Today it is well understood that this mass of backward humanity exercised a sinister influence on the white population and the general progress of the South. Only in recent years has it been surmounted, and what does a traveler in the Birmingham district find today? Expensive automatic machinery being installed to replace the mythical cheap Negro labor. With common labor at $3 for eight hours, skilled labor $4 to $5, and best molders on piece rates earning $7 to $8, a Southern plant is bound to mechanize if it is to continue production.

A pipe foundry will thus spend $2,500,000 to develop a method of centrifugal casting which converts the whole foundry into a complicated machine. A fittings manufacturer will install completely automatic units for molding, pouring, cleaning and delivery to

inspectors at the rate of one mold per worker per minute. A steel producer will replace four scattered blast furnaces with two new ones, surrounded by so many labor-saving devices that the two new ones will use only as much labor as one of the old ones.

Such are the conditions we find when backward labor becomes reasonably well civilized. The situation which existed some generations prior to that time is illustrated in the new Central African copper region. The Union Minière, with rich ore, produces hardly one-third the copper that comes from the lean ores in Arizona; yet it employs more workers than all the Arizona mines put together. Why should an African Negro work? He can get everything he really needs and actually wants from the jungle without working, and it takes generations of association with higher standards of living before the Negro begins to hanker after the comforts and luxuries with which the white man surrounds himself. Experience on the Rand is repeating itself in Rhodesia that mining costs are higher because labor is cheaper. Consequently, the new districts seriously consider bringing in expensive white labor to operate mines and smelters in a land well populated with pauperized blacks.

It may be objected that conditions in Ireland or France cannot be compared directly with those of Katangâ. But the latter illustrates the principle at the limit, as the mathematician would say. European labor may be more fairly compared with the white mill operatives in Tennessee and North Carolina. Even there, the employers are finding that textile factories, built to exploit "cheap" labor, are hardly operating before they face an insistent demand for shorter hours, better rates, cheaper housing, and all the other elements that constitute an enlightened labor policy and a prosperous, contented public which consumes the articles their machines can manufacture.

Old Automobiles as Scrap

"LET your old car apply as first payment on a new one," an advertising and sales promotion slogan used in one form or another by nearly all automobile companies, has become a boomerang. This turning in of old cars, together with many cases of excessive trade-in allowances, has created a used car problem of such magnitude that automobile manufacturers generally are now taking note of it, though it was once regarded as exclusively a dealers' matter.

About 2,500,000 automobiles become obsolete every year; but that does not mean that all of them go out of existence. Many old automobiles, which naturally should seek the scrap heap, are rejuvenated so that they will run further, and are sold over and over again or traded in for new cars or other used cars which have more life in them.

Some time back the story was repeatedly told of old automobiles taken from scrap dealers' yards and turned in as part payment on new cars, with allowances of from $200 to $300, whereas as scrap they would not be worth $25.

In various sections of the country the abandonment of worn-out cars at the roadside has created problems for municipalities. The borough of Queens, New York, was in disturbance lately over the thousands of such old wrecks that were cluttering up the landscape and that cost the city government a large sum to haul away to dumps. A city scrap yard was one plan proposed to meet the situation.

In several cities the automobile dealers have banded together to establish their own scrap yards, agreeing that all cars of a certain age shall not be resold but shall go to the scrap heap. These efforts are being watched closely by the National Automobile Chamber of Commerce and by individual automobile manufacturers as pointing the way to the best organized handling of the wrecking of old cars.

Old automobile scrap also presents a problem for steel manufacturers. If properly prepared and segregated, it is usable in the blast furnace and in the open-hearth furnace; but when mixed with other and better grades of scrap, as frequently happens, it dilutes the value of the latter. When alloy steel parts are included in the mixture, the trouble caused to the steel plant operator is sometimes serious, since it is impossible to get rid of some alloys in the open-hearth furnace. If, however, these alloy steels are properly segregated and their analyses known, the use of some of them becomes possible.

The situation calls for concerted effort on the part of the automobile industry, the scrap industry and the steel scrap consumers. Old material dealers at present sees no great profit in scrapping old automobiles because of the expensive equipment required to do the work properly and the comparatively low prices at which this grade of scrap must be sold. If such scrapping were done on a large scale, with the cooperation of the automobile industry, the scrap trade and the steel companies, much good would result.

The automobile industry would benefit by the reduction in number of used cars on the market. Steel makers would gain by a more careful preparation of automobile scrap, and a great deal of old material now going to waste would be conserved for remelting, thus creating a larger open market supply of usable scrap and stabilizing prices at levels which would permit the maximum use of old material in steel furnace mixtures. Moreover, many municipalities would be relieved of a problem that may eventually react unfavorably on the automobile industry, which, rightly or wrongly, is often charged by public officials with some responsibility for cluttering of roadways with automobile wrecks.

Changing Tides in Industry

SIGNIFICANT of the changes over the years which have brought metal manufacturing to the fore is the story told in a review of industrial development in Indiana, which has been published by the Bureau of Business Research, Indiana University. An outstanding feature is a series of tables showing the ten leading industries at a succession of dates, beginning with 1860 and closing with 1925. To some degree the great steel plant at Gary may have unbalanced the showing for metals, but the remaining factors in the State's metal-working industries probably show a typical development.

Metal-working in 1860 was represented among the ten leading industries by foundry and machine shop products, in fifth position, and agricultural implements, in eighth position. The two together accounted for products amounting to $2,280,000, while the leading

industry (flour and meal) reported products valued at $17,338,000.

This may be contrasted with the ten leading industries of 1925, all but two of which—the fourth and fifth—are metal-working. Iron and steel works and rolling mills head the list, followed by motor vehicles, foundry and machine shop products, slaughtering and meat packing, furniture, electrical machinery, iron blast furnaces, electric and steam railroad cars, steam railroad repair shops, motor vehicle bodies and parts. The tenth item in the 1925 showing had more than three times the value of product reported for the first item in 1860.

Gradual displacement of the leading items in the earlier years is traced from one list to the next as successive decennial periods yielded their returns. The flour and grist-mill products remained in first position through 1890 and were in second position in both 1900 and 1910. But they do not appear at all among the ten leading industries of 1925. Slaughtering and meat packing held first position in 1900 and 1910, dropping to fourth in 1925.

Iron and steel first entered the list in 1870, in ninth place, advancing to sixth in 1880, disappearing altogether in 1890, so far as the first ten items are concerned, reappearing in 1900 as fifth item (a position retained in 1910) and, as indicated above, taking first place in 1925, owing largely to the great concentration of iron and steel making in the northwest corner of the State.

Automobiles first became prominent in 1910, in seventh position. They held second position in 1925, while bodies and parts in tenth position should be added to the volume of manufacture of automotive units. These two items together, however, would not have displaced the steel works and rolling mills from first rank.

Taking the total value of product in 1860, metal-working represented only 6.8 per cent of the $33,379,000 aggregate output of the ten leading manufacturing industries in that year. In 1925, when the aggregate output of the ten leading industries was $1,045,155,000, metal-working constituted 83.5 per cent of the total. In the interim the metal-working percentage had shown a consistent gain—to 9½ per cent in 1870, 22½ in 1880 and 1890, 26½ in 1900 and 40½ in 1910. During the 65 years the output of metal-working plants among the ten leading industries had multiplied by 382, compared with an increase only 39-fold for the two items apart from metal-working which were in the 1925 list of the first ten lines of industry.

A Unique Presidential Address

Mr. Hoover Glorifies Scientific Research as a Potent Impulse to Progress

PRESIDENT HOOVER made a notable address at Dearborn, Mich., Monday evening, Oct. 21, when many leading Americans were guests of Henry Ford in celebrating the 50th anniversary of Thomas Alva Edison's invention of the incandescent electric lamp and in dedicating the Edison Institute of Technology, the gift of Mr. Ford.

What the President said in tribute to Mr. Edison and in appraisal of the world's debt to him was on a high plane. Of especial interest to IRON AGE readers are the President's views of the relation of research to progress in pure science and the industrial arts—a subject in which he has taken the deepest interest since he entered public life. His fruitful activity in behalf of the National Research Fund gives emphasis to these passages from his Dearborn address, which in their scientific understanding are unique among the utterances of our presidents:

"In making this, as in his other great inventions, Mr. Edison gave an outstanding illustration of the value of the modern method and system of invention, by which highly equipped, definitely organized laboratory research transforms the raw material of scientific knowledge into new tools for the hand of man. * * *

"Mr. Edison, using organized, systematic laboratory research, has been one of the great leaders who have converted the pure physics of electricity into a taxable product. Today the governments of the world levy upon upward of sixty billions of new wealth founded upon electricity.

"But the taxes and new wealth are not the major accomplishments of the men of this genius. These are the rivers of sweat saved from the backs of men and the infinite drudgery lifted from the hands of women.

"I may emphasize that both scientific discovery and its practical application are the products of long and arduous research. *Discovery and invention do not spring full grown from the brains of men. The labor of a host of men, great laboratories, long, patient, scientific experiment build up the structure of knowledge; not stone by stone, but particle by particle.* This adding of fact to fact some day brings forth a revolutionary discovery, an illuminating hypothesis, a great generalization, or a practical invention.

"Research both in pure science and in its application to the arts is one of the most potent impulses to progress. For it is organized research that gives daily improvement in machines and processes, in methods of agriculture, in the protection of health, and in understanding. From these we gain constantly in better standards of living, more stability of employment, lessened toil, lengthened human life and decreased suffering. *In the end our leisure expands, our interest in life enlarges, our vision stretches. There is more joy in life.*

* * * "Our scientists and inventors are among our priceless national possessions. *There is no sum that the world could not afford to pay these men who have that originality of mind, that devotion and industry to carry scientific thought forward in steps and strides until it spreads to the comfort of every home.*"

* * * "Not by all the profits of all the banks in the world can we measure the contribution which these men make to our progress. Their discoveries are not the material for headlines. Their names are usually known to but a few. But the nation owes them a great honor and is proud to demonstrate through Mr. Edison today that their efforts are not unappreciated. The country can well pay its tribute to the men of this genius by expanding the facilities for their labors. The nation today needs more support to research. It needs still more laboratories."

Southern Metal Trades Hold Annual Convention

John S. Schofield, president of the J. S. Schofield's Sons Co., Macon, Ga., was elected president of the Southern Metal Trades Association at its eleventh annual convention at Knoxville, Tenn., Oct. 16 and 17. Paul R. Moore, Columbus Iron Works Co., Columbus, Ga., was named first vice-president; W. G. Mealor, Gainesville Iron Works, Gainesville, Ga., treasurer; and William E. Dunn, Jr., Atlanta, secretary.

George B. Cocker, Cocker Machine & Foundry Co., Gastonia, N. C., who retired as president of the association, was presented with a handsome silver service by the members in appreciation of his services. Mr. Moore led the discussion on the subject of costs at the business session. The convention closed with a visit to the plant of the Aluminum Co. of America near Knoxville.

Meetings of American Electrochemists

For the annual spring meeting of the American Electrochemical Society to be held in St. Louis, May 29 to 31, 1930, a symposium on hydroelectrometallurgy is scheduled. The chairman is T. H. Donahue, research engineer, Anaconda Lead Products Co., East Chicago, Ind. The symposium will cover copper, zinc, lead, cadmium, bismuth, silver, etc. There will also be sessions on refractories, rectifiers and the plating of rare metals.

A visit to a new electrolytic zinc plant and other industries in and around St. Louis, as well as an all-day excursion to the lead mines through the beautiful Ozark Mountains, are on the program. The headquarters will be at the Hotel Coronado.

Future conventions of the society are announced as Detroit in the fall of 1930; Birmingham, Ala., in the spring of 1931, and Salt Lake City in the fall of that year.

Index for Industrial Use of Electricity Rises

Industrial consumption of electricity in the United States, according to the *Electrical World* index, was 135.8 in September, compared with 128.2 in August and with 134.5 in September of last year. The index is based upon electrical energy consumption by 3600 scattered manufacturing plants, their average in 1923-1925 being 100.

The metal industries group advanced from 140.7 to 149.2. Both components showed an increase, that for rolling mills and steel plants going from 150.9 to 152.3, while metal-working plants, ferrous and non-ferrous, advanced from 134.6 to 147.4. Automobiles, including parts manufactured, declined from 143 to 138.1. Shipbuilding showed a large advance, from 96.3 to 114.9.

The Week in Business

Drift of Current Financial and Economic Opinion

STOCK market deflation has proceded further, following a brief interruption in the second week of the month. The main cause for the decline, according to Col. Leonard P. Ayres, is an excessive accumulation of undigested securities. "For months past," he says, "the outpourings of new securities have been enormous, and finally the public ceased to take the new issues with the avidity they had shown earlier."

The large-scale flotation of securities has a definite connection with the high level of brokers' loans, in the opinion of Alexander D. Noyes, New York *Times*. In the face of stock market liquidation, there has been an increase of $400,000,000 in brokers' borrowings in New York alone since Sept. 1, on top of a billion dollar expansion in the preceding three months. Such a picture, says Mr. Noyes, raises the question whether a great part of the year's new issues have not remained unsold and carried along on brokers' credit, in first or second hands.

Reduction in "Outside" Loans Throws Burden on Banks

The gain of $88,000,000 in brokers' loans last week nearly wiped out the reduction of the previous week, bringing the total to within $3,000,000 of the record peak. A new feature of the latest increase was that it was supplied by the banks and that loans from "others" declined. In the view of Benjamin Baker, *Annalist*, "the figures show again the banking danger which made its appearance so emphatically at the beginning of the year—namely, that with any withdrawal of "others" loans the member banks and the Reserve banks would have to take up the load as the only means of avoiding a money disturbance of greater or less severity."

The fact that "stocks tumbled badly" last week with call rates relatively easy is interpreted by *Commercial and Financial Chronicle* as demonstrating that the course of the money market does not control the course of the stock market. On the other hand, the Harvard Economic Society sees the possibility of easier money again "stimulating speculative activity, as it usually does." But it does not expect more than a moderate easing of credit under the present Reserve policy, which is unlikely to be changed unless serious business recession threatens.

Signs of Moderating Business Pace

While general business has definitely moderated, it is still high in comparison with previous autumns. Symptoms of slackened activity are seen in a decline in commodity prices and an expansion of commodity stocks, which, however, are not seriously large except in a few lines. Bank debits and export trade have failed to show their usual seasonal gain, says the Harvard Economic Society, important branches of manufacturing have slowed up, and building remains in reduced volume.

Both building and foreign trade are expected to benefit from securities deflation. The outlook for residential construction is steadily improving, in the opinion of Standard Statistics, because, under money conditions of the past year, demand has been catching up with supply. Betterment in the capital market of the outside world, according to advices from abroad, is regarded as the logical sequel of the withdrawal of European funds from New York and renewed American interest in fixed-return securities.

Sees Stocks Back on Sound Basis

A sanguine view of the present status of business and of stocks is taken by Charles E. Mitchell, chairman of the National City Bank of New York, as quoted in a London message to the New York *Times*. "All the basic industries are doing satisfactorily and, unless something unforeseen occurs, should continue to do so," he said. The shakedown of stock prices has brought "many leading industrial securities to levels which would have been considered perfectly sound and conservative even by the standards of 10 years ago."

Iron and Steel Markets

Good Bookings in Ship Steel and Rails

Rail Orders Account for 563,000 Tons and Vessels for 105,000 Tons—Inquiries for 25,000 Freight Cars in Prospect —Motor Car Outlook Still Uncertain

THE week's news has accentuated the contrast between the reduced steel requirements of the automobile industry and the sustained demand from other sources.

Rail orders have added 563,000 tons to mill books and shipbuilding contracts will account for 105,000 tons. Structural steel awards for the week are high, totaling 58,000 tons, compared with 23,000 tons in the preceding week. Freight equipment purchases so far in October call for 20,000 cars, or 28 per cent of the total number bought in the first nine months of the year, and orders for 25,000 additional cars are in prospect.

Farm implement manufacturers are stepping up production of spring tools and will soon be operating at a peak rate. The entering of orders for tin plate, following the impending announcement of next year's price, will enable mills that are not now working on anticipated tonnage to increase their production.

Steel mill operations show wide variations, depending on the extent to which different finished products are used in the motor car industry, but steel ingot output has undergone little further reduction. Some independents are making raw steel at the rate of 70 per cent, or even less, but the Bethlehem Steel Corporation is operating at 82 per cent and the United States Steel Corporation average remains at 80 per cent.

The view is gaining ground that production has struck bottom. In the Valley district, which ships more steel to the automobile industry than any other producing center, ingot output is down to 70 per cent, but no further curtailment is looked for. In the Pittsburgh area crude steel production is being maintained at an 80 per cent rate and rail mill operations are being increased. At Chicago the tardiness of rail specifications has caused the temporary banking of a steel works blast furnace.

Scrap markets are inactive, but the downward trend of prices has been arrested, with heavy melting grade unchanged at Pittsburgh for a second week. Pig iron melt is well sustained except among foundries serving the automotive industry. In fact, Cleveland reports an increase in pig iron shipments, notably to manufacturers of heating equipment. Good operations among steel foundries reflect the influence of railroad equipment buying.

The outlook in the automobile industry remains uncertain. Production of new models is being delayed until large stocks of present models, both in manufacturers' and dealers' hands, are disposed of. The sale of used cars is also a problem, although in some sections distributers' stocks have been reduced materially.

With the steel industry adjusting itself to the slump in automotive requirements, the price situation gives signs of clarifying. At least changes of the past week were not significant, being limited to recognition of recent concessions or to the readjustment of quotations on certain products to bring them into line with others. Thus wire nails, which have lacked stability for some time, now range from $2.40 to $2.50 a keg, Pittsburgh, the lower figure representing a decline of $1 a ton from the previous minimum open quotation. At Chicago, bars and shapes have been reduced $1 a ton, following frequent shading of the former price. A decline in metal furniture sheets to a flat price of 4.10c., Pittsburgh, is in sympathy with prior reductions in commoner finishes.

Shipbuilding is looming up as a more important outlet for steel. Two Dollar line vessels have been placed with the Newport News Shipbuilding & Dry Dock Co., and six tankers have been awarded—two for the Sinclair company to the Bethlehem Shipbuilding Corporation, two Standard Oil Co. vessels to the Federal Shipbuilding & Dry Dock Co., and two for the Tidewater Oil Co. to the Sun Shipbuilding & Dry Dock Co. These vessels, together with two merchant ships to be placed this week, will require close to 105,000 tons of steel. Six car floats, ordered by the Reading Co., will call for 3500 tons of plates and shapes.

Railroad equipment business recently closed, together with that which will probably be placed in the next two months, will give most freight car builders a substantial backlog of work for the early months of 1930. The Pennsylvania has bought 1000 steel box cars from the Bethlehem Steel Corporation, and the Burlington has entered the market for 600 cars out of a total of 2700 to be inquired for.

The week's awards of fabricated steel included 17,500 tons for the Cornell Medical Center, New York, and 16,000 tons for a Pennsylvania Railroad station at Philadelphia. Of 38,000 tons of new work that came into the market, 15,000 tons is for a Chicago tower building. Conspicuous among prospective projects is a 100-story building in New York for the Metropolitan Life Co., which will require 30,000 to 40,000 tons of steel.

THE IRON AGE composite price for pig iron has advanced from $18.29 to $18.38 a gross ton. The finished steel composite remains at 2.369c. a lb.

A Comparison of Prices

Market Prices at Date, and One Week, One Month and One Year Previous, Advances Over Past Week in Heavy Type, Declines in Italics

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Reduced Requirements of Automobile Industry Only Flaw in Steel Demand—Operations at 80 Per Cent

PITTSBURGH, Oct. 22.—If it were not for the reduced requirements of the automobile industry, steel demand in this and nearby districts would be considered about normal for this time of the year. It might be somewhat less than it was last October, which was a month of unusually heavy activity in many steel-consuming industries, but was not a period in which the automobile makers accounted for as large a percentage of steel shipped as they did in the first six months of this year.

The placing of heavy rail tonnages in the last week improved sentiment in the market somewhat, although these orders were scarcely 5 per cent ahead of placements last year by the same railroads. The rail mill in the district is already stepping up its schedules, and diversion of steel to this use will perhaps reduce the amount of semi-finished steel which might be offered for sale.

Steel orders from car builders are being received by local sheet and plate mills, and a survey indicates that shops served by steel makers in the Pittsburgh district have secured enough business from the recent buying movement to keep them well occupied until the second or third month of next year.

Agricultural implement makers are taking steel in increasing quantities, and, in gaging the implement demand for next year on which they are now beginning to work, they do not expect curtailed buying from the farmers in any districts except possibly parts of Western Canada.

Next year's price on tin plate is expected to be announced within the next two or three weeks and the entering of orders at that time will enable mills which are not already working on anticipated tonnage to increase production in that department. Structural demand is not heavy in this particular locality, but fabricating shops are fairly well engaged. Barge builders are now completing orders booked earlier in the year, but prospective business in both barges and self-propelled river craft is encouraging.

Steel plant operations have not changed materially in the last week. Slight improvement in some departments is naturally stressed more than further curtailment in others. Ingot operations average about 80 per cent of capacity, with the larger mills making a well diversified line of products at a somewhat better rate. Some independent makers of sheets and strips are not higher than 50 per cent. Sheet mill operations, as a whole, are at 70 to 75 per cent, while strip mills average between 50 and 60. Pipe mills have been slowed down slightly this month.

Present prices are holding and recent reductions have clarified the situation and probably have led to the placing of considerable tonnage which had been held in abeyance.

Wire nails have been reduced $1 a ton and are now quoted at $2.40, Pittsburgh, to large buyers and at $2.50 in carload lots. Wire prices are

unchanged, with 2.40c. a lb. generally quoted for manufacturers' wire. Bars and shapes are still quotable at 1.90c. to 1.95c., Pittsburgh, and, although the lower figure is not applying on much plate tonnage in this territory, reports of shading are common in the East.

Pig Iron.—The market continues very dull so far as sales or inquiries for large tonnages of iron are concerned. Local sellers are taking orders regularly for lots of two or three carloads, and foundries in the district are evidently buying iron only as they actually need it. Prompt shipments are readily obtainable from nearly all the Valley and local furnaces, and, with prices subject to little or no shading, there is no incentive to cover against future wants. The steel foundries in the district are operating at a good rate, and shipments to them are heavy. The same cannot be said of the sanitary ware and radiator makers, whose wants are limited. The largest maker of sanitary ware does not expect to buy any large tonnages of iron before the first of the year, although some small lots may be purchased to fill out. Prices are unchanged at $18.50, Valley, for basic and foundry iron, and $19 for malleable. The local furnace is quoting prices 50c. higher.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.00

Freight rates to points in Pittsburgh district range from 63c. to $1.13

Semi-Finished Steel.—The market is without feature, as there is little or no spot inquiry for semi-finished steel, and most non-integrated steel companies have covered their requirements for this quarter by contract. A few companies, which are not ordinarily large sellers of billets, slabs and sheet bars, are making rather active efforts to dispose of surplus tonnage, but users of these products are limited and the majority of them have definite sources of supply from whom they seldom divert their tonnage. The price situation seems reasonably firm, with $35 the ordinary quotation on billets, slabs and sheet bars, and $40 on forging billets. Wire rods are holding at $49, Pittsburgh or Cleveland, and there is little activity.

Rails and Track Accessories.—Both the Pennsylvania and New York Central rail tonnages were placed during the last week, the Pennsylvania having ordered 310,000 tons and the New York Central 206,430 tons. The Erie Railroad has placed 46,460 tons of rails. Distribution of these orders is given elsewhere in this issue. The Erie has not yet placed its track accessories, nor has the New York Central. The Pennsylvania track accessories are bought quarterly. The Pere Marquette is reported to have closed on 5000 tons of tie plates.

Bars, Shapes and Plates.—Business in the heavy hot-rolled products has changed very little in the last three weeks, but sentiment in the market has improved somewhat, and a few companies reported slightly better specifications on bars. Structural awards in this district are not heavy, but fabricating shops are fairly well engaged and there is enough work in prospect to insure a fairly good business for the remainder of the quarter. Specifications for plates to cover recent car awards are not yet reaching mills in this district in heavy amounts, but this business is bound to be placed in the near future and will improve mill backlogs materially. Prices are still subject to shading, but there is no indication that less than 1.90c., Pittsburgh, is being done on either bars or shapes. Plates are holding better in this district, although there are reports of lower prices in the East.

Wire Products.—Makers of wire and wire nails have announced new prices, effective immediately, and are now quoting nails at $2.40 to $2.50 per keg, Pittsburgh, the range depending on the size of the jobber. This is a decline of $1 a ton from recent levels. Manufacturers' wire is now quoted at 2.40c., Pittsburgh base, while quotations to jobbers on bright plain wire, No. 6 to 9 gage, are unchanged at 2.40c. to 2.50c., Pittsburgh. With the $3 extra for annealing, this makes a price of 2.55c. to 2.65c., Pittsburgh, for annealed fence wire, which constitutes the largest part of the jobbers' tonnage. Business is rather quiet, but recent changes are expected to clarify the price situation somewhat. Demand for manufacturers' wire has been influenced adversely by the decreased automobile production, but this is expected to show some improvement next month.

Tubular Products.—The inquiry for 300 miles of 4, 6 and 8-in. line pipe, which was reported last week, is now thought to have been confused with an inquiry for 50 miles of 6-in. and 50 miles of 8-in. pipe, on which the prospective buyer asked for prices on three types of end finishes. This inquiry also included a few miles of 4-in. pipe. Otherwise inquiry for line pipe is quiet and demand for seamless goods from the oil country is not heavy. Movement of butt-weld pipe is receding seasonably, but mills are still fairly well engaged. Mechanical tubing is quiet, but there is a better call for boiler tubes.

Sheets.—If it were not for the automobile industry, the sheet business would be considered excellent for this time of the year, as other important consuming industries are taking tonnage at a satisfactory rate. Heavier specifications for blue annealed and galvanized sheets are expected from the railroad car builders in a short time, and if the automobile industry begins to come back next month the quarter may prove to be a more satisfactory one than was anticipated a few weeks ago. At present, demand from the automotive industry is negligible, but the Ford Motor Co. has begun to place specifications for November shipments and others are expected to follow suit in a short time. It is worthy of note that the Ford specifications do not indicate any marked model changes. Sheet prices are becoming better established at recent reduced prices. Black sheets are now quotable at 2.75c., Pittsburgh, as the

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1½% Nickel)	$0.25
2100	(1¼% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	26½	½	23	5
½	56	42½	¾	28	11

1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅛	1 to 2	34	18
1 to 1¼	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note. Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

higher figure has practically disappeared and automobile body sheets are now at 4c., flat. Metal furniture sheets are also quotable at a flat 4.10c. Galvanized material is still quotable at 3.50c. to 3.60c., although the higher figure is gradually disappearing. Shading in blue annealed sheets has not developed to any marked extent in this district, although the wide strip mill product is quoted at $4 a ton under the regular maximum quotations of 2.35c., on the No. 13 gage jobbing mills sheets and 2.20c. on the No. 10 gage.

Tin Plate. — Operations have changed little in the last week, although the leading interest has curtailed its production slightly. The average for the independent companies is about 60 per cent of capacity. It will be two or three weeks before the 1930 price on tin plate will be announced and, in the meantime, contracting is held in abeyance.

Strip Steel.—The strip market has a firmer tone, as the demand is improving from many industries and a few companies are receiving increased specifications from the automobile makers. The Chevrolet Motor Co. has begun to place tonnage for November shipments and other smaller users will soon be back in the market. The hardware industry is now an active consumer of strip steel. Operations in the district average between 50 and 60 per cent of capacity and have improved slightly in some mills in the last week. Prices are unchanged and shading seems to be on the wane rather than on the increase. Hot-rolled material is holding at 1.90c. and 2c., Pittsburgh, and cold-rolled at 2.75c. to 2.85c.

Cold-Finished Steel Bars.—Specifications are coming in at approximately the rate which has prevailed during the month, but there are signs of improvement in some directions. The agricultural implement industry is stepping up its operations in preparation for next season's requirements and will soon be at the peak rate. This business is one of the largest consumers of cold-finished bars and, while Pittsburgh mills do not share heavily in this business, it constitutes a fair portion of their tonnage. Demand from the automobile industry has not yet begun to show much improvement. Prices are holding at 2.30c., Pittsburgh.

Old Material.—The scrap market has undergone little change in the last week, and, while at least two consumers are reported to have placed small tonnages, both sales come within the recent price range of $17 to $17.50 for No. 1 heavy melting steel. Scrap is not nearly so plentiful as it was at the beginning of the month, but dealers are having no trouble in picking up material for shipment against recent sales. Hold-ups are still in effect at two important consuming points, but steel scrap is moving more freely into other plants and it is believed by some that the market has reached bottom. Generally speaking, prices quoted last week are still representative of the market on all grades and tendencies toward strength are reported in a few lines.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.25c.
Hoops	4.25c.
Black sheets (No. 24), 25 or more bundles	3.80c. to 3.90c.
Galv. sheets (No. 24), 25 or more bundles	4.45c. to 4.55c.
Light plates, blue annealed (No. 10), 1 to 24 plates	3.35c. to 3.45c.
Blue annealed sheets (No. 13), 1 to 24 sheets	3.50c. to 3.60c.
Galv. corrug. sheets (No. 28), per square	$4.43
Spikes, large	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.

Machine bolts, 100 count,	60 per cent off list
Carriage bolts, 100 count,	60 per cent off list
Nuts, all styles, 100 count,	60 per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft, ann'l'd, base per 100 lb.	$2.90 to 3.00
Wire, galv. soft, base per 100 lb.	2.90 to 3.00
Common wire nails, per keg	2.80 to 2.90
Cement coated nails, per keg	2.95 to 3.05

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.00 to $17.50
No. 2 heavy melting steel	15.00 to 15.50
Scrap rails	16.00 to 16.50
Compressed sheet steel	16.75 to 17.25
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels	15.50 to 16.00
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.00 to 12.50
No. 2 railroad wrought	17.00 to 17.50
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.50 to 21.00
Railr. coil and leaf springs	20.50 to 21.00
Rolled steel wheels	20.50 to 21.00
Low phos. billet and bloom ends	21.50 to 22.00
Low phos., mill plates	21.50 to 22.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	19.00 to 20.00

Coal and Coke.—The coke market is without interest and, while demand for the domestic grade is rather strong at this time, furnace coke is quiet and is feeling the reduced requirements of the steel industry. Prices seem to be showing more strength, but the market on furnace coke is still quotable at $2.65 to $2.75 per ton, Connellsville. Stronger prices are reported from the East. Foundry coke shipments are showing some improvement, but the demand is not heavy and little spot tonnage is coming into the market. Coal business still disappoints, and although reports of better prices and heavier demand come from the lower West Virginia field, the districts around Pittsburgh are not doing so well. The end of the Lake movement in a few weeks will also influence shipments adversely.

Jones & Laughlin Profit in Quarter $5,690,226

The Jones & Laughlin Steel Corporation, in the quarter ended Sept. 30, had net income, after deductions for depreciation, depletion, bond interest, etc., of $5,690,226. After payment of dividends on common and preferred stock, balance carried to surplus amounted to $3,366,014. Net income in the first nine months of the year amounted to $16,995,913.

The regular dividends of 1¾ per cent on preferred and 1¼ per cent on common stock were declared, as well as an extra of 1 per cent on common.

Steel Foundry Operates 45 Days Without Accident

Having won the inter-plant contest of the Chicago Safety Council for the best record in July, the Pettibone Mulliken Co., manufacturer of steel castings, is now setting out to make an even better mark in the prevention of accidents. For 45 days beginning July 1 the company did not have a lost-time accident.

By assuming its own casualty risk, the company has cut its cost of insurance from $36,000 to $11,000 yearly. A central safety committee, composed of the operating manager, plant physician and superintendents of the various departments, supervises safety. This group holds regular monthly meetings at which problems are discussed and plans mapped out for cutting down the accident rate.

Each month the committee appoints from a different department some man to act as an inspector. This employee devotes a portion of each day to a tour of the plant, inspecting safety devices, noting whether the men are taking all precautions against injury and making recommendations for changes and improvements.

Joseph T. Ryerson & Son, Inc., Chicago, has sold its line of table and floor-type horizontal boring, drilling, and milling machines to the Ohio Machine Tool Co., Kenton, Ohio, but will retain rights as exclusive distributors of the line. The Ohio Machine Tool Co., which has been building these machines for some time for the Ryerson company, will expand and improve the line.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Bar and Shape Prices Settle to Minimum of 2c.—Rail Orders Only Feature of Buying

CHICAGO, Oct. 22.—Both sales and new offers to consumers in this district establish prices for mild steel bars and structural shapes at 2c. to 2.05c. a lb., Chicago. This price situation is somewhat a reflection of a market which is gradually becoming quieter in sales and consumption of steel. New business, largely influenced by rail orders, averages well with purchases in recent weeks, but the fact that rail business is heavy serves to stress the slackened demand for plates, shapes and bars. Specifications for steel mill products are the best since mid-March, but fully one-half of the tonnage released is for rails and a large share of the remaining 50 per cent is for car material, leaving little tonnage that will be taken by miscellaneous consumers, including fabricating shops. Chicago mills participated to the extent of over 200,000 tons in a rail-buying movement which brought the total placed in the week to well over the 500,000-ton mark.

Notwithstanding that heavier-than-usual rail purchases have been made earlier than is customary and that some shipping schedules have already been arranged, actual releases are being held in check and rail mill output has not gained as was expected by producers.

Lack of immediate shipping instructions for rails, together with light demand for steel in other directions, has necessitated curtailment in blast furnace output. No. 7 stack at Gary has been banked. The leading producer is now operating 16 of its 27 furnaces, and for the district as a whole there are 25 steel mill stacks in blast of a total count of 36. Two stacks are banked in the hope that business will soon warrant putting them in blast in the near future.

New railroad equipment inquiries include 600 cars for the Burlington. The trade is expecting inquiries from the Missouri - Kansas - Texas, Cotton Belt and Chesapeake & Ohio.

Plate and shape business developing in Oklahoma includes 11,000 tons for tanks and 7500 tons for buildings and bridges.

Ferroalloys.—This market, viewed from all angles, is quiet. It is reported that 50 per cent ferrosilicon contracts will be offered by the middle of November.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Sheets.—Output in this district remains at close to 85 per cent of hot mill capacity. New buying by the bulk of consumers is still for nearby needs and in the aggregate it is still about equal to shipments. New specifications, which usually are entered at mills at time of purchase, amply support the current rate of output. Backlogs are small and stationary. Lighter commitments for blue annealed sheets have brought deliveries to the range of three to four weeks, and mills that six weeks ago were out of the market with heavy order books are now actively seeking tonnages for delivery about the middle of November. Prices in and near Chicago and the Northwest are holding.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Pig Iron.—Prices for silvery iron have given away $1 a ton on recent sales in this market. Shipments are at the low point of the year and new business is scarce, thereby leading to unusually keen competition. The Northern iron market in and around Chicago remains steady at $20 a ton, furnace. Shipments are well up to the average of September, and practically the full output of local furnaces is moving to melters. Forward buying is practically at a standstill, but spot purchases are at a high fall level. Demand for malleable iron is on the upturn, as use of malleable castings on railroad equipment absorbs some of the slack in melt made necessary by the curtailment in automobile manufacture. Four charcoal furnaces are in blast and output exceeds shipments by a small margin. Prices for Southern iron remain unchanged.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Wire Products.—Favorable weather conditions throughout most of the country have contributed to outdoor work in rural communities. The result is that jobbers are experiencing an active fall demand, which is fully equal to, if not above, what had been expected. In the Great Lakes region and in the Northwest the weather has remained open longer than usual, and this has been of benefit to the jobbing trade. The manufacturing trade, with the exception of automobile builders, continues to take satisfactory tonnages. The demand for nails is seasonally dull. Prices at Chicago are not above $2.45, base, per keg. Shipments of woven wire fencing are in good volume, the bulk of the tonnage going to jobbers, with only occasional lots being taken by the railroads. Production schedules for heavy electrical cables are well filled to the end of the year. Demand for wire rope is steady and has run ahead of the corresponding part of 1928.

Cold-Rolled Strip.—Specifications are measurably lighter, and output for the country as a whole has receded to 50 per cent of capacity. Backlogs, inquiries, new buying and specifications are at the low point of the year. Some estimates place the normal needs of cold-rolled strip by automobile manufacturers at 60 per cent of the output of the country. It is pointed out that no improvement in demand for this commodity can be expected until there is a swing upward in output of automobiles.

Rails and Track Supplies—About 563,000 tons of standard-section rails have been ordered by the Pennsylvania, New York Central and the Erie. Other orders are expected from the Rock Island, Illinois Central and Chicago & North Western. Though no official figures are available on the tonnages these railroads will take, the opinion is generally expressed here that they will exceed in size the orders placed for 1929 delivery. The Pennsylvania bought 310,000 tons, which is said to be the largest single order ever placed by a railroad. The distribution of the past week's orders is given elsewhere in this issue. New business in track fastenings is confined to tonnages for current track work. Releases against new rail orders have not been as heavy as sellers had expected, and the increase in the rate of rolling, which was to have gone into effect this week, has been postponed.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—This market continues to mark time, with only occasional inquiries and lettings of more than 100 tons each. Sellers look for little improvement in conditions in the near future, though they see some light in the early part of next year if the bond market continues to strengthen. The Merkle Contracting Co., Kansas City, Mo., has been awarded the general contract to lay 44,000 ft. of 8-in., 2500 ft. of 6-in. and 6000 ft. of 4-in. pipe at O'Fallon, Ill. Royal Oak, Mich., has placed 1500 tons of cast iron pipe with the Lynchburg Foundry Co. This award was reported last week as having been taken by an unnamed bidder. The only inquiry of note in this district is by Streeterville, Ohio, which will buy 1000 ft. of 8-in., 17,000 ft. of 6-in., 6000 ft. of 4-in. and 3000 ft. of 2-in. cast pipe. Notwithstanding lagging interest on the part of buyers, prices are well stabilized at $35 to $38 a ton, Birmingham. Deliveries of all common sizes of cast iron pipe are prompt.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Reinforcing Bars.— Fabricating shops are shipping close to a normal volume of bars for this time of the year, but backlogs are light. Prices continue to show wide variation. Rail steel bars appear well established at

2c. a lb., but billet steel reinforcing bars show weakness and business has been taken at 2c., Chicago warehouse. Stocks in the hands of dealers are ample for current needs and promises of deliveries from mills are satisfactory. Sellers of reinforcing bars are closely watching progress of the plans for subway construction in Chicago. Preliminary estimates of reinforcing bars needed place the figure at 150,000 tons. As now indicated this work may get under way in 1930.

Wire Rods.—Specifications are coming in only in moderate volume. Prices have been definitely settled to $41 a ton, Chicago.

Plates.—New inquiries for oil storage tanks loom large as prospects brighten for an increase of petroleum production in the Oklahoma City, Okla., field. New business in sight totals 11,000 tons of plates. This, added to the inquiry that has been before the trade, brings the total prospective tonnage to more than 20,000 tons. New orders of tank plates total 2200 tons, of which 1000 tons is for shipment to an Oklahoma fabricator. The railroad equipment market remains active. Orders are close at hand for the 85,000 tons of steel needed for the Santa Fe cars. Although official plans are not announced, it is generally believed that shops will not rush through new orders, but rather will spread them out by holding to the present rate of output.

Old Material.—The Chicago scrap iron and steel market is dull in the heavy tonnage grades, but a substantial volume of quiet purchases is being made by steel foundries. Dealers are finding scrap harder to sell and they are also finding greater difficulty in meeting with the closer lines being drawn on specifications. Rejections are running unusually high, but the inflow of scrap is ample and there is little doubt that large melters are having their needs well filled. Railroad shipments are normal for this time of the year, while industrial scrap is probably in somewhat smaller volume than is usually expected in the early fall months. Dealers' yards in Chicago are not overburdened with stocks, but it is reported that country yards are piled high with scrap that is not moving. Prices, with few exceptions, are weak. Late last week heavy melting steel on sales that aggregated between 15,000 and 20,000 tons sold off 25c. a ton. Brokers offering cast iron borings to users at present quotations find no takers. Stocks of this grade are accumulating in the hands of producers and dealers and it is rather commonly believed that prices must be revised downward before they will be attractive to consumers. The Burlington will sell 3000 tons and special mid-month lists are being offered by the Pennsylvania and Nickel Plate.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.00c. to 2.30c.

No. 1 agricultural cast	13.25 to	13.75
Stove plates	12.25 to	12.75
Grate bars	11.75 to	12.25
Brake shoes	10.75 to	11.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Bars.—Schedules at mild steel bar mills are more flexible, and deliveries may be had in 10 days to four weeks, depending on the sizes. Both sales and specifications, influenced largely by the needs of railroad car builders, are heavier than a week ago. Prices still show variation, with occasional concessions of $1 a ton. Demand for iron bars shows some improvement as the railroads take larger quantities. The rail steel bar market is featureless. New business balances shipments. Prices are steady.

Structural Material.—The outstanding award this week was 4500 tons for a railroad bridge in St. Louis. Other than this, awards were fairly plentiful, but of small individual size and spread over a wide area. Structural shop backlogs are growing lighter. Even large shops, which to date have been fairly well fortified with work, now are showing hunger for new tonnage. Prices of fabricated steel are weak and at a lower level than a year ago.

Mill prices on plain material, per lb.: 2.00c. to 2.05c. base, Chicago.

Wholesale Prices Fall Slightly

The index number of wholesale prices in September, as reported by the United States Bureau of Labor Statistics, was 97.5, compared with 97.7 in August and with 100.1 in September, 1928. All are based on 100 as the average of 1926. Of the major groups farm products and metals showed declines from August. Foods, hides and leather, fuel and lighting, building materials, chemicals and drugs and the miscellaneous items registered increases. Textile products and house furnishing goods showed no change.

While metals and metal products declined from 104.3 to 104.1, the iron and steel component remained stationary at 97.6, non-ferrous metals dropped from 105.1 to 104.9, agricultural implements from 98.3 to 98.2 and automobiles from 110.7 to 110.3. Other metal products showed no change.

Distribution of Week's Orders for Rails

THE Pennsylvania divided its order for 310,000 tons of standard-section rails as follows: Carnegie Steel Co. and Illinois Steel Co., jointly, 155,000 tons; Bethlehem Steel Corporation, 136,400 tons; Inland Steel Co., 18,600 tons.

New York Central orders totaling 206,430 tons were apportioned as follows: Bethlehem Steel Corporation, 87,040 tons; Illinois Steel Co., 76,200 tons; Carnegie Steel Co., 13,860 tons; Inland Steel Co., 16,930 tons; Dominion Iron & Steel Co. of Canada, 12,400 tons.

The Erie ordered 46,460 tons, of which Carnegie Steel Co. will furnish 24,387 tons; Illinois Steel Co., 11,112 tons; Bethlehem Steel Corporation, 7474 tons; Inland Steel Co., 3487 tons.

New York

Pig Iron Melt Well Sustained—Railroad Needs and Structural Work Feature Steel Orders

NEW YORK, Oct. 22.—Pig iron consumption in this district is holding up well. Virtually no suspensions of shipments are reported and in some cases melters are asking for deliveries of iron scheduled for shipment in November. Since little automotive work is done in this territory, the sustained melt is regarded as testimony to continued satisfactory condition of business outside of the motor car industry. The fact that there is little interest in first quarter requirements is merely a reflection of caution on the part of buyers. Purchases are confined mainly to spot needs and, at 8000 tons for the week, are of average proportions. The only large current inquiry is one for 3000 tons for the Thatcher Co., of which 1000 tons of No. 2X is for its Newark, N. J., plant and 2000 tons of No. 2 plain is for Garwood, N. J. While deliveries are to extend into the first quarter, they are to begin in November. Southern foundry iron is still offered at $13.50 to $14, base Birmingham, or $19 to $19.50, at docks in New York harbor. At this level Alabama iron is sharply competitive with Northern brands. Considerable barge iron is moving down the State canal from Buffalo, but it is doubtful whether the water movement this year will equal that of 1928. Current sales for barge movement must be made with an eye to the closing of navigation about the middle of next month.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Cast Iron Pipe.—Municipal buying of pressure pipe has declined with election approaching, and private purchasing is limited to small lots of pipe and fittings. Prices continue unsteady, with $32 to $33 a net ton, foundry, usually quoted by Northern makers, but $31 is occasionally bid when competition is keen. The Department of Water Supply, Gas and Electricity, New York, has opened bids on a number of small contracts for furnishing and laying water and gas pipe, but awards are still pending.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe, $3 extra.

Finished Steel.—Railroad and structural steel orders are the features of steel buying in this market. The rail orders of the New York Central and Erie roads were placed last week, and details of distribution are given elsewhere in this issue. Car builders are optimistic that the car buying movement will continue during the remainder of the year, and prospective inquiries total upward of 25,000 cars. In structural steel, the principal award of the week was 17,500 tons for a hospital for the Cornell Medical Center in New York, which went to the Hedden Iron Construction Co. The Metropolitan Life Insurance Co. will build a 100-story building facing Madison Square Park which will require 30,000 to 40,000 tons of steel, but the inquiry has not yet been issued. In some lines of steel consumption, the demand has increased moderately in the past week, but the gains are too spotty to be indicative of a general upward trend in buying.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.22½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Old Material.—Buying prices of brokers are off 50c. a ton to $15, delivered, on No. 1 heavy melting steel for the consumer at Bethlehem, Pa., but are unchanged at $15.50 a ton, delivered, to mills at Coatesville and Steelton, Pa. No. 2 heavy melting steel is being bought at $11.75 a ton, delivered Pottsville, Pa., $13 a ton, delivered Phoenixville, Pa., and $13.25 a ton, delivered Harrisburg, Pa. The quotation on steel mill stove plate is slightly softer, with brokers paying a maximum of $8 a ton, New York, or $11.50 a ton, delivered to a consumer at Phoenixville, Pa. Despite the low level of prices, a fair volume of all grades of scrap is reported available, although no surplus supplies are pressing on the market.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.00 to $12.35
Heavy melting steel (yard)	8.00 to 9.50
No. 1 hvy. breakable cast.	10.25 to 11.00
Stove plate (steel works).	8.00
Locomotive grate bars	8.25
Machine shop turnings	7.50 to 8.00
Short shoveling turnings	7.50 to 8.00
Cast borings (blast furn. or steel works)	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles	18.00 to 18.50
Iron car axles	23.00 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.25
Forge fire	9.50 to 10.00
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought, long	11.00 to 11.50
Rails for rolling	12.75 to 13.25
Stove plate (foundry)	8.00 to 8.50
Malleable cast (railroad)	13.50 to 14.00
Cast borings (chemical)	9.50 to 10.00

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$16.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	14.00
No. 2 cast (radiators, cast boilers, etc.)	13.50

Warehouse Business.—Activity this month has not shown the improvement over September that is usual at this season. Demand for galvanized sheets is fair, but prices are still subject to concessions on both black and galvanized. There is a moderate volume of buying in structural steel, but bars, plates and blue annealed sheets are quiet.

Coke.—The market is unchanged, with furnace grade at $2.75 a net ton, Connellsville. Beehive foundry coke is

quoted at $4.85 a net ton, ovens, for special brands, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Cleveland

Improvement in Automotive Steel Buying Expected To Be Slow—Some Orders Placed for November-December

CLEVELAND, Oct. 22.—The volume of business continues light in all finished steel products. Reports from the automotive industry do not offer encouragement for much, if any, improvement for several weeks. Automobile manufacturers are still confronted with the problem of disposing of large stocks of present models of cars. Not only are dealers well stocked up but some manufacturers have rather large stocks that have not yet been passed along to the dealers. The disposal of used cars is still a problem, although in some sections stocks of used cars have been reduced considerably.

One automobile plant that recently resumed operations on a 1600 car per week schedule is shut down this week. Several motor car manufacturers are evidently delaying in getting under production on their new models until they can get present stocks largely disposed of. There is little expectation that the automotive industry will get under good operation again before January, and, if that is the case, the steel industry will not be stimulated much from this source before December. Operations of other industries in this territory are holding up fairly well.

Steel bar, sheet and strip mills in this territory are operating on considerably reduced schedules and have little tonnage on their books. There is little change in the price situation. Sheet prices appear well stabilized at the recent reductions, the only evidence of weakness being in metal furniture sheets.

Pig Iron.—The most encouraging feature of the market is an increase in shipments, which so far this month show quite a gain over those of the corresponding period of September. The increase is confined to fields other than the automotive industry. Shipments to automotive foundries continue light. Stove, radiator and furnace manufacturers are taking a fair amount of iron. Sales by Cleveland interests in the past week amounted to 18,600 tons in foundry and malleable iron, which was a gain over those of the previous week. The Westinghouse Electric & Mfg. Co. purchased approximately 1000 tons against its recent inquiry for iron for its Cleveland plant. The business went to Lake furnaces. Several other Cleveland foundries purchased smaller lots. There is practically no change in the price situation. Local furnaces are holding to $19, furnace, for Cleveland delivery. For outside shipment, $18.50 is the ruling price, and this is also being quoted by Valley furnaces. Lake furnaces that serve the Michigan territory appear to be holding to a $20 base for foundry grades for the eastern half of the State, but a $19.50 price is prevailing in central and western Michigan, where there is competition from the Chicago territory. Lower prices seem to have disappeared on Southern foundry iron, which is now quoted at $14 to $14.50, Birmingham.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$20.50 to 21.00
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—Sheet bar specifications have been a little better the past week than during the early part of the month. Billets and slabs are dull. The Corrigan, McKinney Steel Co. has reduced operations, now running 11 of its 14 open-hearth furnaces. Incoming orders are against $35 contracts for sheet bars, billets and slabs.

Coke.—Demand for foundry coke is light and prices on better grades are unchanged. Connellsville heating coke is moving in limited volume at $2.75 to $3, ovens. There is a lull in the demand for blast furnace coke for domestic use, but producers have their October output sold. Ohio by-product foundry coke is quoted at $8.25, ovens.

Iron Ore.—The consumption of Lake ore during September amounted to 5,361,567 gross tons, a decrease of 417,570 tons from August. The amount consumed in September last year was 4,607,963 tons. Ore on hand at furnaces Oct. 1 amounted to 32,360,108 tons and the amount at furnaces and Lake Erie docks on that date was 38,125,312 tons, as compared with 35,808,367 tons on Oct. 1 of last year. Central district furnaces consumed 2,745,624 tons of ore in September, a decrease of 167,320 tons for the month. Lake front furnaces used 2,378,053 tons, a decrease of 202,021 tons. Eastern furnaces melted 124,098 tons, a decrease of 1123 tons, and all-rail furnaces used 113,792 tons, a loss of 47,106 tons. There were 186 furnaces using Lake ore in blast Sept. 30, a decrease of six for the month.

Strip Steel.—While some hot-rolled strip was purchased by the automotive industry during the week, the orders were not large enough to have much effect on mill schedules, which have been sharply reduced. Some of the mills are operating at not over 50 per cent of capacity and have virtually no backlogs. Cold-rolled strip appears to be moving even slower than the hot-holled material. Prices on hot-rolled strip appear to be holding fairly steady, for the small lots that are moving, at 1.90c., Pittsburgh, for wide material and 2c. for narrow. On cold-rolled strip 2.75c., Cleveland, is the ruling quotation.

Bars, Plates and Shapes.—Demand for steel bars, which declined sharply with the curtailment of the automotive industry, shows no improvement. Structural shapes and plates also are rather quiet. Orders for all three products are confined to small lots. Forge shops catering to the automotive industry do not have much business. Reinforcing bars are very dull. In the structural field, 3500 tons was placed for an Akron bank and office building. New inquiry is light. Small fabricating shops are well filled with work, but some of the larger shops need orders. Steel bars are quoted at 1.90c., Cleveland, by local mills. While outside mills quote a range of 1.90c. to 1.95c., Cleveland, the lower price has become more general. Weakness recently reported on plates seems to have disappeared, and plates and shapes are commonly quoted at 1.95c., Pittsburgh.

Sheets.—Orders from the automotive industry are rather spotty and business in the aggregate is light. Additional releases of good-sized lots of auto body sheets for the new Chevrolet cars were issued during the week for November and December shipment. An inquiry for 1300 tons of various grades for electric refrigerators is pending from a Cleveland stamping plant. Steel barrel manufacturers are operating better than a few weeks ago and this has brought orders for black sheets. Weakness has developed in metal furniture sheets, on which 4.10c. is now the common price, with reports of a 4c. price. Blue annealed sheets and light plates rolled on jobbing mills appear to be holding to regular quotations, but on continuous mill products going to the automotive industry in fair to large-sized lots the market seems definitely established at 2.15c. for No. 13 gage and 2c. for No. 10 light plates. Galvanized sheets

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands, No. 12 to ⅛ in., inclusive	3.25c.
Hoops and bands, No. 13 and lighter	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.70c. to 3.90c.
Galvanized sheets (No. 24)	4.60c. to 4.75c.
Blue ann'l'd sheets (No. 10)	3.25c.
No. 9 ann'l'd wire, per 100 lb.	$2.65
No. 9 gal. wire, per 100 lb.	3.00
Com. wire nails, base per keg	2.65

*Net base, including boxing and cutting to length.

are steady at 3.50c. and efforts to get a higher price seem to have disappeared.

Wire Products.—Wire is moving slowly and nails are very dull. The nail market continues weak. Ruling prices are $2.40 per keg to jobbers and $2.50 to dealers. Wire is fairly steady at 2.40c., Cleveland.

Warehouse Business.—The improvement that usually appears in jobbers' business in October has failed to materialize this month. While warehouses are getting a good number of orders, they are for smaller lots than usual. Demand for galvanized sheets is tapering. Prices are well maintained.

Old Material.—The market continues dull, activity being largely limited to purchases of heavy melting steel and blast furnace scrap by dealers to cover outstanding orders. With the exception of a 50c. a ton reduction on No. 2 busheling, prices are unchanged and the market does not show a tendency toward either higher or lower quotations. Dealers are able to buy all the scrap they need within the range of the quoted prices. Mills have good stocks, and it is not expected that there will be much new consumer demand during the next few weeks.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.75 to $15.00

Rails for rolling	16.25 to 16.50

Philadelphia

Plate and Shape Demand Active—Pennsylvania Expected To Take Full Rail Options This Year

PHILADELPHIA, Oct. 22.—Steel orders continue in fair volume, but small in individual tonnage, especially in bars and sheets. Plate mills in eastern Pennsylvania are maintaining varying rates of operation, certain mills having curtailed, while others are still fairly well engaged. Shape mills are booking some good business, with construction work at a high level despite the advanced season. A substantial part of the present business is coming from the railroads. Plates and shapes for six car floats for the Reading Railroad have been placed by shipbuilders and the Pennsylvania Railroad has placed 1000 cars to be built by the Bethlehem Steel Co. at Johnstown, Pa.

Allocation of the Pennsylvania Railroad's 1930 rail requirements brought 88,000 tons, with 48,400 tons more on option, to the Bethlehem Steel Co., 100,000 tons, with 55,000 tons more on option, to the Carnegie Steel Co., and 12,000 tons, with 6600 tons on option, to the Inland Steel Co. Although this railroad on its 1929 rail tonnage took only slightly more than one-third of its 70 per cent option, the fact that this year's option is for 55 per cent of the award and that considerable electrification work is in progress leads mills to believe that the entire optional tonnage may be taken.

Pig Iron.—Current buying of foundry iron is confined almost entirely to carload lots or less than 100 tons. The market is somewhat less firm, with certain eastern Pennsylvania sellers seeking more tonnage, but concessions of more than 50c. a ton from $21, base, furnace, have not generally appeared, as present buying is not sufficiently large to bring out the minimum price. Consumers are increasingly inclined to delay purchases while they seek concessions from the current market. About 1000 tons of foundry iron for a local foundry has been pending award since August and the buyer has, meanwhile, been buying carload lots for immediate needs at $21 a ton, base. No inquiries have been made for basic iron, but two leading buyers are expected in the market soon.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. IX	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Buying is limited to small lots and 1.90c., Pittsburgh, or 2.22c., delivered Philadelphia, is the usual price on new business, although 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia, is still quoted on the less desirable specifications.

Reinforcing Bars.—Projects requiring steel are increasing and a substantial tonnage of bars is being placed, but prices show no tendency to advance. Billet steel bars are quoted at 1.95c. to 2.05c., Pittsburgh, or 2.27c. to 2.37c., delivered Philadelphia, usually without the extra charge for cutting to length. Rail steel bars range from 1.85c. to 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.17c. to 2.27c., delivered Philadelphia. New bids being taken on the Farm Show Building, Harrisburg, Pa., call for 245 tons of reinforcing bars. A bulkhead on the Schuylkill River in Philadelphia will require 500 tons of bars.

Shapes.—Certain of the smaller fabricators are seeking tonnage and quoting keenly competitive prices, but most shops are well engaged with contracts and bidding on a larger tonnage of new business than is usual at this season. Prices, however, show no tendency to advance from 1.90c. to 2c., f.o.b. nearest mill to consumer, or 1.96c. to 2.06c., delivered Philadelphia. The Pennsylvania Railroad has awarded the steel contract for a suburban passenger station at West Philadelphia to the McClintic-Marshall Co. The project calls for 16,000 tons of steel. Steel for the Farm Show Building, Harrisburg, Pa., on which former bids were rejected as they exceeded the appropriation, has been reduced on the new inquiry from 4000 to 1700 tons.

Plates.—Shipyards and railroads are contributing some good tonnages of plates. A total of 3000 tons has been placed for six car floats for the Reading Railroad, two to be built by the Newport News Shipbuilding & Dry Dock Co. and four by the New York Shipbuilding Corporation. The United States Lines is expected to call for bids about Nov. 15 on two large passenger ships. The Pennsylvania Railroad has placed 1000 cars with the Bethlehem Steel Co. Plate

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.60c. to 2.80c.
Cold-fin. steel, rounds and hex	3.60c.
Cold-fin. steel, sq. and flats	4.10c.
Steel hoops	3.55c.
Steel bands, No. 12 to ⅜-in. inclus.	3.30c.
Spring steel	5.00c.
*Black sheets (No. 24)	4.10c.
†Galvanized sheets (No. 24)	4.85c.
Light plates, blue annealed (No. 10)	3.25c.
Blue ann'l'd sheets (No. 13)	3.40c.
Diam. pat. floor plates—	
¼-in.	5.30c.
⅜-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

prices are unchanged at 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Sheets.—The market is quiet and demand is light, with both automobile body and radio manufacturers on curtailed operations in most cases. Black sheets range from 2.75c. to 2.85c., Pittsburgh, or 3.07c. to 3.17c., delivered Philadelphia, and galvanized sheets are at 3.50c., Pittsburgh, or 3.82c., delivered Philadelphia. Blue annealed sheets are unchanged at 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage and blue annealed light plates, No. 10 gage, are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia. These prices on blue annealed sheets and light plates are shaded $2 a ton when competition is encountered from the product of the continuous mill, or preferred buyers are in the market.

Imports.—In the week ended Oct. 19, a total of 204 tons of pig iron arrived at this port from Norway, 31 tons of ferromanganese from the United Kingdom and 28 tons of ferrochrome from Switzerland. Steel imports consisted of 37 tons of steel scrap from the United Kingdom, 25 tons of steel bars from France and 19 tons from Belgium, 46 tons of steel hoops from Germany, 101 tons of structural shapes from France and 100 tons from Germany.

Old Material.—Buying of scrap by consumers is small and prices show a continued tendency to decline. Heavy breakable cast, however, seems to have reached a temporary low point at $14.50 a ton, delivered, as efforts of consumers to buy at $14 and $14.25 a ton, delivered, have not met with much success. No. 1 and No. 2 heavy melting steel is coming out in good volume at the present level of prices.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$15.50 to $16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50 to 14.00
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	14.50 to 14.75
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.50
Shafting	19.00 to 19.50
Steel axles	22.75 to 23.25
No. 1 forge fire	14.00
Cast iron carwheels	16.50
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Railroad Equipment

Orders for 25,000 to 30,000 More Cars Expected This Year

ALTHOUGH railroad equipment buying in the week was featured by only one sizable order, that of the Pennsylvania Railroad for 1000 steel box cars, the outlook for railroad equipment purchases over the remainder of the year continues promising.

Fully 25,000 to 30,000 cars may be purchased in the next two months. For most of these the formal inquiries have not appeared, but they are expected soon.

Details of the week's business follow:

Of about 2700 cars to be inquired for by the Burlington, inquiries have reached the market for 500 automobile cars and 100 flat cars.

Pennsylvania Railroad has ordered 1000 steel box cars from Bethlehem Steel Corporation.

An inquiry from the Chesapeake & Ohio for 5000 or 6000 cars is expected soon.

Bessemer & Lake Erie is reported to be preparing plans for 3000 cars.

An official statement of Pere Marquette says that a rehabilitation program will involve purchase of rolling stock to replace about 25 per cent of that now owned. This would mean purchase of about 4500 freight cars and more than 100 locomotives.

Missouri Pacific's expected inquiry may be for about 4000 cars.

Wabash may inquire for 2000 cars.

New York, New Haven & Hartford and Chicago & North Western are expected purchasers of several thousand cars each. Chicago & North Western is now inquiring for 100 underframes for caboose cars.

North American Car Corporation is inquiring for 1500 steel underframe refrigerator cars.

Cerro de Pasco Copper Corporation has ordered 20 50-ton cars from American Car & Foundry Co.

Imperial Refining Co., Ltd., is inquiring for 215 tank cars.

Reinforcing Steel

Pending Work Totals 7680 Tons —Awards 4600 Tons

INCLUDING 1000 tons for a bridge on the Pacific Coast, reinforcing steel awards in the week totaled nearly 4600 tons. Pending work amounts to about 7680 tons, of which 1100 tons is for an assembly plant for the Ford Motor Co. at Edgewater, N. J., 1000 tons for a rubber manufacturing building at Passaic, N. J., and 1000 tons for a warehouse in San Francisco. Awards follow:

PHILADELPHIA, 375 tons, medical building for Temple University, to Taylor-Davis, Inc.

PHILADELPHIA, 325 tons, Henry Avenue bridge, to Taylor-Davis, Inc.

CHICAGO, 125 tons, building for Kroger Grocery Co., to Concrete Engineering Co.; previously reported to an unnamed bidder.

CHICAGO, 500 tons, warehouse for Goodyear Tire & Rubber Co., to Calumet Steel Co.

CHICAGO, 150 tons, Fine Arts Building, to Joseph T. Ryerson & Son, Inc.

CHICAGO, 250 tons, bridge, to Concrete Engineering Co.

PEORIA, ILL., 350 tons, bridge, to Concrete Engineering Co.

MILWAUKEE, 100 tons, structure for Milwaukee Railroad, to American System of Reinforcing.

TACOMA, WASH., 290 tons, cold storage plant, to unnamed bidder.

EVERETT, WASH., 500 tons, pulp plant for Puget Sound Pulp & Timber Co., to Pacific Coast Steel Co.

PORTLAND, ORE., 1000 tons, St. John's River bridge, to Pacific Coast Steel Co.

PORTLAND, 200 tons, plant for Paper Makers Corporation, to Mercer Steel Co.

SACRAMENTO, CAL., 100 tons, club house, to unnamed bidder.

SAN FRANCISCO, 135 tons, school at Turk and Ashbury Streets, to Truscon Steel Co.

LOS ANGELES, 320 tons, warehouse at Bay and Mateo Streets, to Blue Diamond Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

EDGEWATER, N. J., 1100 tons, assembly plant for Ford Motor Co.

PASSAIC, N. J., 1000 tons, United States Rubber Co. plant, general contract to Turner Construction Co.; 100 tons for foundation was awarded to Concrete Steel Co., as reported last week.

HARRISBURG, 245 tons, Farm Show Building; bids open Oct. 23.

PHILADELPHIA, 700 tons, Henry Avenue bridge over Wissahickon Creek; previously reported as 150 tons.

CITY OF PHILADELPHIA AND PENNSYLVANIA RAILROAD, 550 tons, bulkhead on west bank of Schuylkill River; Frederick Snare Corporation, general contractor.

PHILADELPHIA, 100 tons, viaduct, Thirtieth and Arch Streets; Vincent Jafolla, general contractor.

AURORA, ILL., 175 tons, building for Illinois Bell Telephone Co.

CHICAGO, 500 tons, warehouse for Goodyear Tire & Rubber Co.

CHICAGO, 500 tons, garage.

STURGEON BAY, WIS., 110 tons, State highway bridge; bids Nov. 6.

TACOMA, WASH., 800 tons, Eleventh Street viaduct; bids Oct. 21.

PORT ANGELES, WASH., 500 tons, pulp mill; bids being taken.

SAN FRANCISCO, 550 tons, Pier No. 1; general contract placed.

SAN FRANCISCO, 1000 tons, warehouse for Pacific Gas & Electric Co.; bids opened.

Machine Tool Builders Meet

The practical value of establishing an apprenticeship training program and a further improvement in trade practices were stressed by Henry Buker, vice-president, Brown & Sharpe Mfg. Co., Providence, R. I., in his address as president of the National Machine Tool Builders' Association at its twenty-eighth annual convention, which opened its general sessions at Briarcliff Manor, N. Y., Tuesday afternoon.

The association unanimously voted to expand its program of activities during the coming year and elected the following directors for a three-year term: C. R. Burt, vice-president and general manager, Pratt & Whitney Mfg. Co., Hartford, Conn.; George E. Randles, president, Foote-Burt Co., Cleveland, and Robert M. Gaylord, vice-president, Ingersoll Milling Machine Co., Rockford, Ill.

Pacific Coast

Reinforcing Steel Awards Total Upward of 2500 Tons—Demand for Structural Steel Well Sustained

SAN FRANCISCO, Oct. 19 (*By Air Mail*).—Reinforcing steel bar trade was the most active feature of the steel market this week, more than 2500 tons having been placed. Included among the more important contracts were 1200 tons of structural shapes for a viaduct in Denver, 1000 tons of bars for a bridge at Portland and 450 tons of rails for Long Beach, Cal. Prices continue on a fairly even keel, and little shading has been indulged in.

Pig Iron.—Foundry operations have shown little signs of improvement and increased pig iron buying is not looked for until after the first of the year. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Mild steel bars are not in active demand, though prices appear to be firm at 2.35c., c.i.f. coast ports. Most of the orders received by mills call for small lots of numerous sizes. Awards of reinforcing steel bars this week were the heaviest of any week since the latter part of June. The Pacific Coast Steel Co. took 1000 tons for the approaches to the St. John's River bridge, Portland, and 500 tons for a pulp plant at Everett, Wash. The Mercer Steel Co. secured 200 tons for a factory in Portland and the Truscon Steel Co. booked 135 tons for a school in San Francisco. Included among pending projects are 1000 tons for a warehouse in San Francisco and 800 tons for the Eleventh Street viaduct in Tacoma. Prices on this class of material continue at 2.30c., base, on carload lots and 2.60c. on smaller tonnages in the San Francisco district, Los Angeles prices being $2 a ton higher.

Plates.—Plate business this week was limited to lots of less than 100 tons, and new inquiries of importance were lacking. The largest pending project calls for 1400 tons for a 36 to 48-in. welded steel pipe line at Everett, Wash., bids on which will be opened Oct. 24. Prices are not firm at 2.35c., c.i.f.

Shapes.—Demand for structural steel is well sustained. Awards this week included, in addition to 1200 tons for the Twenty-third Street viaduct, Denver, mentioned above and placed with the American Bridge Co., 500 tons for a telephone building in Vancouver, B. C., placed with the Western Bridge Co., and 100 tons for a school in San Francisco, booked by Dyer Brothers. Bids were opened this week on 1337 tons for a bridge over the San Luis Rey River in southern California. The Port Stockton Cement Co., Stockton, Cal., is taking bids on 1000 tons for a cement plant. Plain material remains firm at 2.35c., c.i.f.

Track Material.—The United States Steel Products Co. secured 300 tons of 128-lb. girder rails and 150 tons of 90-lb. T-rails at $34,181 for Long Beach. Bethlehem Steel Co. was the only other bidder at $35,025.

Cast Iron Pipe.—Only three awards in excess of 100 tons were noted in the cast iron pipe market this week. The American Cast Iron Pipe Co. took 110 tons of 10-in. Class 150 pipe for Eureka, Cal. Burbank, Cal., placed 109 tons of 4-in. Class B pipe with C. G. Claussen & Co. and has opened bids on 261 tons of 6 and 8-in. Class B pipe. An unnamed interest secured 185 tons of 4 to 12-in. Class B pipe for Broadway, Santa Monica, Cal. The National Cast Iron Pipe Co. was low bidder on 297 tons of 10-in. Class B pipe for El Segundo, Cal. Vernon, Cal., and Los Angeles have opened bids on 800 tons and 215 tons respectively.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¼-in. and over	3.15c.
Small angles, under ¼-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Open-Hearth Operations Increased at Alabama Plants—Rail Buying Helps Out at Ensley

BIRMINGHAM, Oct. 22.—As this is an in-between buying period for pig iron, new business is light. It is too early for local consumers to show interest in first quarter iron and inquiries coming in from other territories are in the nature of feelers and have not brought in business for the first quarter. Specifications on contracts for November requirements are frequent, and pressure for immediate shipment is still a factor in the market. Shipments continue to exceed the make, and there is a possibility that October will be the outstanding month of the year in tonnage moved. The base price for the district remains firm at $14.50. Prices to outside points continue to be adjusted to meet competition, concessions varying from 50c. to $1 a ton. Furnace operations are unchanged. Seven are on foundry iron, seven on basic and one on recarburizing iron, a total of 15.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Some improvement is noticed in new business, with the beginning of the fall buying period for certain lines. Recent steel rail and railroad accessory buying has added considerably to the backlog of the Tennessee company. Demand for bars, plates and structural shapes continues at the brisk rate that has been characteristic of the market for some time. Wire products are overcoming some of the slump that began in late summer. New business of structural steel fabricators was better last week than for either of the two preceding weeks. The Nashville Bridge Co. received orders of 450 tons for the Allen Mfg. Co. plant at Franklin, Tenn., and 75 tons for a bascule section of the Pensacola Bay bridge. New orders of the Virginia Bridge & Iron Co. include 220 tons for a garage at Birmingham. The Nichols Copper Co., El Paso, Tex., has ordered 185 tons more from the Ingalls Iron Works Co. New tonnages for reinforcing bars are also developing at a better rate, but demand is still considered below normal. The Tennessee company is operating eight of nine open-hearths at Ensley, an increase of three. Seven of eight are active at Fairfield, and the Gulf States Steel Co. continues to work all six at Alabama City.

Cast Iron Pipe.—Backlogs are being rapidly depleted, and reduced operations will occur unless there is an improvement in buying within the next two weeks. All current projects are small. These include 6000 ft. of 6-in. pipe for Greenville, Ala., to be let Nov. 1; one mile of 12-in. and two miles of 8-in. for Murfreesboro, Tenn., to be let Nov. 1, and 1200 ft. of 6-in. for Marks, Miss., to be let Nov. 5. The United States Pipe & Foundry Co. will ship 44,000 ft. of 20-in., 18,000 ft. of 18-in. and 2000 ft. of 16-in. pipe to Griffin, Ga. Stocks on yards are low and all the current make is being shipped. Prices remain at $37 to $38 a net ton, Birmingham.

Old Material.—A gradual development in demand over the past few weeks has placed steel scrap in a fairly good position. Both dealers' and consumers' stocks are low. Iron material continues inactive, and dealers have large stocks. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Youngstown

Valley Steel Output at 70 Per Cent—No Further Reduction May Be Necessary

YOUNGSTOWN, Oct. 22.—Valley steel makers seem to have reached the low point in operating schedules occasioned by the reduced demands of automobile makers, and began the present week with slightly increased operating rates in some departments. However, the rate of steel ingot production remains essentially unchanged, with approximately two-thirds of the open-hearth furnaces in the district melting and production at not more than 70 per cent of theoretical capacity. It is believed that no further reduction in steel output will be necessary to bring production in line with demand, but the extent of the expected recovery next month is a matter of some conjecture on the part of steel company executives.

Valley steel mills have realized more than ever before in the last two months the full extent of their dependence upon the automobile industry, and the amount of total tonnage produced in the district which goes to the automotive makers or related users is estimated at as high as 35 per cent. No other steel center, with the possible exception of Cleveland, ships more material to that industry.

Increased specifications for November shipment are reported by nearly all companies. But it is not yet known just how large will be the requirements of the two largest makers of low-priced cars. However, it seems assured that both the Ford and Chevrolet companies will be in production on their changed models by Dec. 1 and that their steel tonnage will be gradually stepped during the last month of the year. The future course of other companies is not so well defined, but it is believed in many quarters that other car makers will pursue a very cautious course over the remainder of the year and cannot be counted upon to take steel at anything approaching a maximum rate.

Tin plate production in the district does not average more than 60 per cent of capacity, but a low rate is expected at this time of the year and during November operations can be counted upon to improve gradually as next year's tonnage reaches company order books. Nail and wire mills are also running slowly, and pipe production, at least in butt-weld departments, is tapering off seasonably. Lap-weld and seamless mills are fairly active, but backlogs are light, and oil-country demand is not impressive. Bar mills are running at about 75 per cent of capacity, and demand is described by most makers as somewhat better. Strip operations are very low, but this department is probably profiting more than any others by improving specifications for future delivery. The leading maker of high-finished sheets is running at close to 80 per cent, but this is above the average for sheet mills as a whole.

The price structure, following reductions of an average of $2 a ton on most of the leading products, is much stronger than it was at the opening of the month. A notably favorable influence is the apparent strength of primary materials quotations. As finished steel prices weakened, pig iron and semi-finished steel quotations held, and at higher levels than were in effect in the first and second quarters. Non-integrated steel makers ordinarily exert considerable pressure for lower crude steel prices under such circumstances, but a large per cent of semi-finished steel requirements is now furnished either by a related company or under a long time contract and buyers have found that any open market decline in the price of billets, slabs and sheet bars is nearly always nullified by lower finished steel prices. Nearly all the buyers of semi-finished steel have covered their requirements for the fourth quarter at unchanged prices, and the market is very quiet. The pig iron market is also very quiet, but the price is not seriously questioned by larger users.

Youngstown steel companies are frankly pleased by an opinion made public last week by the Interstate Commerce Commission declaring that the proposed rate of $1.02 on coal from river terminals at Conway and Colona, Pa., into Youngstown is too high. This is the first victory of Valley interests in their effort to secure the advantage of rail-and-barge rates from southeastern Pennsylvania mines to the Valleys.

Canada

Pig Iron Shipments By Water Are Heavy

TORONTO, ONT., Oct. 22.—Although the reduction in Canadian pig iron prices brought no general improvement in the demand, new business continues to appear in steady volume, with the weekly average well sustained. Only a small amount of forward tonnage was booked during the week, but spot sales were fairly heavy. The demand for immediate delivery is holding at a good level and melters are entering the market regularly for lots up to 500 tons. Hand-to-mouth buyers are responsible for the bulk of new business. Shipments on new order account and against contracts are said to be at the high point for the year. Much of the improvement in shipments is due to the fact that water deliveries are being speeded up and endeavors are being made to get as much iron as possible over this route before the close of navigation. Pig iron prices are unchanged for the week and local blast furnace representatives do not look for further reductions in the immediate future.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—Some improvement in sales was noted during the week. Individual tonnages were mostly under the 1000-ton average, but new orders were more numerous than for three or four weeks past. Inquiries are good and some large tonnages are still in prospect for closing before the end of the year. Shipments to new works are in large tonnage and fabricators are running at capacity on back orders.

Old Material.—Except for a slight improvement in demand, the old material market is without change. Mills are taking in good supplies of heavy melting steel and turnings against contracts and are placing small-tonnage orders for immediate delivery. The iron grades are holding at a high level, with foundries and other consumers showing keen interest in the market.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00

Michigan Steel Castings Plant Expands

Rebuilding its main foundry and replacing its 1½-ton furnace with a 3-ton Moore furnace is the program of the Monroe Steel Castings Co., Monroe, Mich. The main foundry, when completed, will be 50 ft. x 225 ft. Oil-fired core ovens are to be installed, consisting of a double compartment rack oven, each compartment to be 5 ft. 6 in. wide and 8 ft. deep to accommodate racks of cores 4 ft. wide, 7 ft. long and 6 ft. high. There are to be two drawer ovens, each 3 ft. x 5 ft., furnished by the Crawford Oven Co., New Haven, Conn. The electric furnace is to be equipped with a 2500-kva. transformer, furnished by the Pennsylvania Transformer Co. A new sand-blast room was recently installed and a 5-ton crane has been purchased.

Boston

Pig Iron Sales Decline—Scrap Prices Hold Firm but There Is Little Business

BOSTON, Oct. 22.—There was a falling off in pig iron sales the past week, with transactions totaling scarcely 2500 tons. The Mystic Iron Works took about 1000 tons, from 800 to 1000 tons went to Buffalo furnaces, and the remainder was in scattered orders, some of which went to Alabama furnaces. Practically all of the sales were in small tonnages for delivery during this quarter and they afforded no real test of prices. The Mystic furnace is holding at $20 to $20.75, furnace, and Buffalo producers are quoting $18, Buffalo. A Rhode Island foundry is inquiring for 1000 tons of malleable for December and first quarter.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Reinforcing Bars.—A State bridge at Jewett City, Conn., calls for 270 tons of reinforcing bars, contract for which has been awarded to the Concrete Steel Co. Other small awards totaled about 300 tons.

Structural Steel.—The city of Boston has awarded two jobs to the New England Structural Co. One was 250 tons for a fire station and the other was 150 tons for a health unit. Structural fabricators are taking a fair volume of work in small tonnages.

Old Material.—One of the quietest weeks of the year has been experienced by the scrap trade. Sellers show little interest in the market and are offering very little scrap, which counterbalances with the position of buyers, who are demanding very little scrap. For the first time in months there was no change in scrap prices, which in itself tells the story of market stalemate. The Italian steamship Amaranto is loading about 1500 tons of scrap at this port for Egypt.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$10.50 to $10.75
Scrap T rails	10.50 to 10.75
Scrap girder rails	9.50 to 10.00
No. 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	9.00 to 9.50
Forge flashings	9.50 to 10.00
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.50 to 9.00
Shafting	13.50 to 14.00
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.25 to 9.50
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.50 to 9.75

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

St. Louis

Pig Iron Market Extremely Dull—Improvement in Steel Buying—Scrap is Weaker

ST. LOUIS, Oct. 22.—With sales of only 800 tons of pig iron, the last week was perhaps the lightest period the St. Louis Gas & Coke Corporation has had since it began production. Sales of Southern makers were correspondingly small. The dullness now marking the pig iron trade is the aftermath of the exceedingly heavy buying movement of more than a month ago. Most melters now are well covered for the remainder of the year. The Granite City maker's sales included 500 tons to a local jobbing foundry, 250 tons to an Iowa melter and 100 tons to a Belleville, Ill., foundry. The melt is holding up well except in foundries catering to the automobile trade. Shipments are not up to last month's movement, but are above the average.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—The movement of domestic grades of coke continues very good, and producers of by-product fuel are reducing their piles. Foundry and furnace grades are also in good demand.

Finished Iron and Steel.—An improvement in buying of plates, shapes and bars and sheets is reported. However, the demand is for materials as they are needed, with little future buying. Bids have been asked for the construction of Wenzlick Tower, an office building which has been under discussion for some time; it will require 3800 tons of structural steel and 450 tons of reinforcing bars. Business continues dull with fabricators.

Old Material.—The market for old material continues weak. Consumers are buying very little, and prices they are offering to pay are reported to be less than dealers are willing to accept. Heavy offerings by railroads centering here were absorbed by dealers, most buying being to fill contracts. Because of low prices very little is coming in from the country dealers. Miscellaneous standard-section rails, rails for rolling, No. 1 railroad cast and stove plate are 25c. off, while heavy turnings, cast iron car wheels and railroad malleable are 50c. less, and railroad springs declined 75c. Railroad lists: Chicago, Burlington & Quincy, 4860 tons; Wabash, 360 tons; New Orleans Great Northern, 150 tons, and Pullman Co., St. Louis, four carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.50 to $14.00
No. 2 heavy melting or shoveling steel	13.00 to 13.50
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	15.25 to 15.75
Railroad springs	17.00 to 17.50
Bundled sheets	10.00 to 10.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	15.75 to 16.25
Machine shop turnings	7.50 to 8.00
Heavy turnings	9.50 to 10.00
Steel car axles	19.50 to 20.00
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	14.50 to 15.00
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	15.50 to 16.00
No. 1 railroad cast	14.50 to 15.00
Stove plate	12.25 to 12.50
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Cincinnati

Easing in Automotive Foundry Demand Affects Pig Iron and Coke—Scrap Market Dull and Weak

CINCINNATI, Oct. 22.—The district pig iron market is quiet and featureless. Sales of iron last week totaled about 3600 tons, an increase of only 50 tons over those of the preceding week. The easing off in the automotive demand is causing district consumers to become cautious and, consequently, buying is confined almost entirely to immediate requirements, with an occasional purchase in anticipation of needs for 30 to 45 days. The largest tonnage placed last week was from the Wickham Piano Plate Co., Springfield, Ohio, which took 300 tons of Northern foundry iron for fourth quarter use. The remainder of the week's tonnage was made up of carload and 100-ton lots. It is apparent that the heavy buying of Southern iron has been checked for the time being. All Southern furnaces doing business in this district are maintaining quotations at about $14 to $14.50, base Birmingham, and no concessions are reported. Quietness of the market in general is reflected by the absence of any sizable inquiry.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—New orders for sheets last week were a trifle less than during the preceding week. Backlogs have been reduced substantially, and the delivery situation is improving, 10 days to three weeks being the usual promise on blue annealed and black sheets and three to five weeks on special sheets. Uncertainty of prices is affecting the wire and wire nail market.

Coke.—As a result of the reduction of specifications for by-product foundry coke from automobile foundries, the shipment of coke on contracts last week was noticeably less than in the preceding week. In fact, oven representatives say that, if specifications continue at the present rate, October shipments will total less than those of September. New business is confined to spot shipments of a car or two at a time.

Old Material.—The old material market is soft and dull. Dealers report that the supply of good scrap is none too plentiful. While the mills are accepting shipments on old contracts at a fair rate, new business is small. Accordingly, dealers have broadened the spread on heavy melting steel, No. 2 wrought, cast iron borings and machine shop turnings to 50c. by cutting the bottom prices 25c.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.00 to $13.50
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	8.75 to 9.25
Bundled sheets	11.00 to 11.50
Cast iron borings	8.75 to 9.25
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.00 to 13.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75

Less than 200 lb	50

Buffalo

Mill Operations Range from 65 to 70 Per Cent

BUFFALO, Oct. 22.—The Ford Motor Co is understood to have placed about 3000 tons of basic with a district furnace. The price is reported to have been about $17.25 to $17.50 on boats, Buffalo. The basic placed is understood to have been of a special grade, analyzing 1.50 per cent silicon. The Ford purchases of pig iron recently are said to total 23,000 tons. An inquiry is out for 1000 tons of malleable from New England and two foundry inquiries from the East run 1500 tons each. The General Electric Co. has bought 1500 tons of foundry and malleable.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Finished Iron and Steel.—Mill operations in this district have dropped further, running now about 65 to 70 per cent, and probably will not gain until the automobile plants resume fuller schedules. A school at Amherst, Mass., calls for 575 tons of shapes instead of 300 tons as previously reported.

Old Material.—Mills apparently have adequate supplies of scrap for present operations and are not now interested in further buying. There has been a nominal weakening of prices in most of the grades. One of the larger mills has issued instructions to dealers to slow down their shipments.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.50 to $16.50
No. 2 heavy melting steel	14.00 to 14.50
Scrap rails	16.00 to 16.50
Hydraul. comp. sheets	14.00 to 14.50
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	14.00 to 14.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	7.50 to 8.00
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	17.50 to 18.00
Coil and leaf springs	17.50 to 18.00
Rolled steel wheels	17.50 to 18.00
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	11.50 to 12.00
Blast Furnace Grades:	
Short mixed borings and turnings	11.50 to 12.00
Cast iron borings	11.50 to 12.00
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	15.00 to 15.50
Stove plate	12.50 to 12.75
Locomotive grate bars	11.50 to 12.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	13.50
Malleable Grades:	
Industrial	17.50 to 18.50
Railroad	17.50 to 18.50
Agricultural	17.50 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.

Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Detroit

October Auto Output to Show Further Decline

DETROIT, Oct. 22.—Industries in this area not directly supplying the automotive plants have not yet been influenced to any great extent by the slowing down of automotive production. Operations in these industries continue at a rate above average.

There have been no important developments in the automotive field during the past week. October output will fall below that of last month and probably below the total for October, 1928. If the total for the current month reaches 400,000 units, it probably will be as much as can be expected.

According to a statement of L. A. Miller, president, Willys-Overland Co., his organization will limit 1930 production to approximately 300,000 units. It is also stated that the Reo Motor Car Co. will adopt a similar policy.

The Murray Corporation of America will reach capacity operation about December, with a daily average of about 1500 bodies. Its new plant containing 750,000 sq. ft. of floor space will be completed by Nov. 1.

Old Material.—The tone of the market on old material is decidedly weak, with most sales on the low side of the price range. Further curtailment of automobile production has reduced the pig iron melt to the lowest point of the year.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$13.75 to $14.25
Borings and short turnings	8.25 to 8.75
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	11.75 to 12.25
Old No. 1 busheling	10.25 to 10.75
Sheet clippings	8.00 to 8.50
Flashings	12.25 to 12.75

City in Iowa Objects to New Rail Rates

WASHINGTON, Oct. 22.—Exceptions to the proposed report of Examiners William J. Koebel and Peter C. Paulson in connection with the investigation of the steel rate structure in Western Trunk Line territory have been filed with the Interstate Commerce Commission by the Marshalltown (Iowa) Chamber of Commerce and Marshalltown shippers. It was urged that the commission should not approve the recommendations, which, it was said, would result in higher rates.

If the report be approved in part or in modified form, the petition said, such action should not be taken until after additional hearings are held. Contention was made that the Western Trunk line carriers are not as a whole entitled to increased class rates. Establishment of higher rates, the petition said, would be prejudicial to interior Iowa points as a whole and especially to central Iowa points and unduly preferential to Mississippi River, Illinois and Official territory competitors of the Iowa shippers.

Tri-cities Ask for Lower Freight Rates on Steel

WASHINGTON, Oct. 22.—Treating bars, plates and shapes as raw materials which their manufacturers use in producing agricultural products and other lines, the Chambers of Commerce of Davenport, Iowa, and Rock Island, Ill., and the Association of Commerce and Deere & Co., Moline, Ill., have petitioned the Interstate Commerce Commission to reopen the Official Classification territory steel rate case and place these products on a lower scale and raise the minimum carload requirement from 40,000 to 80,000-lb. The petition of the Tri-Cities expressed the view that the scale prescribed is excessive and will produce an increased cost of transportation in Illinois territory alone in excess $2,500,000 annually. The increased revenue on the business of the petitioners is estimated at $250,000.

The petition declared that within approximately two years water transportation will be available from the Chicago Steel district, their chief source of supply, to the Tri-Cities and that the cost of transportation of steel by water will be much less than the present rate of 17c. a 100-lb., minimum 36,000-lb., and less than one-half of the proposed rate of 19.5c. per 100-lb., minimum 40,000-lb. The annual movement to the Tri-Cities, it was stated, is about 500,000 tons.

Foundry Equipment Orders Decline Slightly

The September index of gross orders for foundry equipment, as reported by members of the Foundry Equipment Manufacturers Association, was 216.3, compared with 229.5 in August and 170 in the same month a year ago. The index of shipments, at 176.8, showed a gain from the 150.8 of August. Unfilled orders also increased, standing at 480.8, the highest index since September, 1928.

Otis Steel Co. Earnings $1,093,376 in Quarter

Net profits of the Otis Steel Co. for the third quarter of 1929 were $1,093,376, after all charges including estimated Federal taxes of $149,096. This compared with $950,786 reported for the third quarter of 1928, after all charges including taxes of $129,653. Earnings for the period were equal to $1.05 a share on the 841,002 shares of common stock outstanding, against 92c. a share reported on 806,002 shares one year ago.

For the first nine months of 1929, as reported by E. J. Kulas, president, the company earned $3,891,774, after all charges and Federal taxes of $530,696, equal to $3.89 a share on the 841,002 shares of common stock outstanding. In the corresponding period of 1928, the company earned $2,693,852, after all charges and Federal taxes of $367,343, equal to $2.57 a share on the 806,002 shares of common stock.

During September earnings, after all charges, were $321,667, compared with $307,481 in September, 1928.

Youngstown's Earnings Increase in Quarter

The Youngstown Sheet & Tube Co.'s net profits in the third quarter were $6,756,741, a gain of almost $650,000 over the $6,107,057 reported for the June quarter. Gross income was $10,705,026, from which $2,129,213 is deducted for depreciation, $918,403 for miscellaneous charges and $900,668 for interest on funded debt.

Total net profit for nine months is $17,294,114. After dividend requirements on 5½ per cent preferred stock, this is equal to $16.67 per share on 1,000,000 shares of common stock outstanding.

Sharon Steel Hoop Co. to Issue 90,000 New Shares

The Sharon Steel Hoop Co., Sharon, Pa., has authorized the issuance of 90,000 shares of the no par common stock of the company to be offered to stockholders of record on Oct. 28 at $40 a share, and is asking waivers from stockholders on 15,000 shares of this authorized issue. The proceeds of this sale are to be used by the company to reduce its funded debt and for other corporate purposes. Only stockholders owning 25 or more shares will be requested to waive or assign their pro rata subscription rights to the 15,000 shares desired by the company, which are to be held for the purpose of sale to employees and for such other purposes as the directors decide.

Organization Plan for Steel Foundries

A complete plan of organization and program of activities for the future conduct of the Steel Founders' Society of America has been recommended to the executive committee of the society after an exhaustive survey of the steel foundry industry. This recommendation has been favorably received by the executive committee and will be presented to the full membership of the society and to the industry at large at a meeting at the Sherman Hotel in Chicago, Tuesday, Oct. 29. The managing director of the society, Granville P. Rogers, in a statement, urges all steel foundries in the country to be represented at this meeting, which "may mark a turning point in the affairs of the society and the industry."

Non-Ferrous Metal Markets

Lowest Tin Price Since 1923 — Zinc Declines — Copper and Lead Quiet and Steady

NEW YORK, Oct. 22.

Copper.—Consumers of copper continue to buy sparingly and the price is unchanged. Sellers are of the opinion that the present quotation will remain in force for some time to come. Despite moderate activity at present, sales of copper for domestic delivery in October have thus far been the largest since the record month of March when about 110,000 gross tons was sold. Most of this buying took place in September. Domestic consumers are well covered for October, but still have some metal to buy for November delivery. Only a little December metal has been purchased. Foreign consumers are buying fair quantities each day, but still have metal to buy for both October and November delivery, particularly November. Weakness in the London market, which has affected tin and zinc particularly, has had no influence on copper. Electrolytic copper for delivery in the Connecticut Valley is quoted at 18c., with Lake copper at 18c. to 18.12½c., delivered. The quotation of Copper Exporters, Inc., is still at 18.30c., c.i.f. usual European ports.

Tin.—Spot Straits tin has continued to decline each day during the past week from the low point of a week ago until yesterday when it was 40.25c., New York. This was the lowest price since Aug. 21, 1923, when it was 39.37½c. Today, because of a slight recovery in London, spot Straits tin, New York, was higher at 41.37½c., New York, about 500 tons changing hands, with dealers the principal buyers. Sales for the week ended Saturday, Oct. 19, were about 700 tons, with sales for yesterday and today amounting to about 700 tons more. Despite the declining market, buyers continued hesitant and did not buy much on the way down. Yesterday the market was very weak, but today buying by two London houses, one evidently covering short sales, has strengthened the situation. A feature has been the free selling in the Far East, where good quantities have been disposed of each day. A revision in the estimate of Straits shipments in October places the total at about 9000 tons instead of 10,000 tons. London prices today were about £1 per ton higher than yesterday, with spot standard quoted at £182, future standard at £186 and spot Straits at £186 10s. The Singapore price today

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Oct. 22	Oct. 21	Oct. 19	Oct. 18	Oct. 17	Oct. 16

Zinc	3.50c.	4.00c.
Sheet aluminum	13.75c.	16.00c.
Cast aluminum	12.00c.	14.00c.

was £186 10s., with 475 tons reported sold, which does not add strength to the market. Stocks in London warehouses are lower at 10,412 tons because of shipments to New York.

Lead.—Although the London market was decidedly lower yesterday, with a slight recovery today, prices here are unchanged at 6.70c., St. Louis. Demand has been quiet for some time and is even lighter now. The leading interest continues to quote 6.90c., New York, as its contract price.

Zinc.—Because of marked weakness in the London market, with prices at a level which would permit imports of prime Western zinc at prevailing levels, producers here have generally lowered their quotations to 6.70c., East St. Louis, or 7.05c., New York. Thus far, this has not stimulated buying, which continues moderate. It is stated that orders from consumers are at the lowest point since the organization of the American Zinc Institute. With stocks so low, it is argued that larger buying must appear before long. This depends largely on the conviction of consumers that the bottom of the market has been reached. Because of a deadlock between producers and buyers of ore, purchases were down to 7720 tons last week, increasing stocks materially. Production was 13,000 tons for the week. The ore price is unchanged at $44, Joplin.

Antimony.—There is a good demand from consumers for October and early November delivery, due to the Chinese revolutionary disturbances. The market is accordingly stronger for Chinese metal at 8.75c., New York, duty paid, for all positions.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. per lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 22.—The local nonferrous metal market is quiet. Prices for tin are off 2c. a lb. and quotations are lower on zinc. Prices for antimony have reacted upward. The old metal market is without feature.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 41.25c.; lead, 6.80c.; zinc, 6.80c.; in less-than-carload lots, antimony, 9.62½c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

L. A. Benson & Co., Baltimore, have been appointed distributers in the Baltimore district for the products of the Diamond Chain & Mfg. Co., Indianapolis.

Non-Ferrous Ingot Prices in October

CHICAGO, Oct. 21. — Non-ferrous Ingot Metal Institute reports below the average prices per pound received by its membership on commercial grades of the six principal mixtures of ingot brass during the 28-day period ended Oct. 11. As there are, as yet, no generally accepted specifications for ingot brass, it must be understood that each item listed below represents metal known to the trade by a common designation but, in reality, including many variations in formulas. Until the program of standardizing the principal specifications, now progressing in cooperation with the American Society for Testing Materials, is completed, the following specifications will be understood to refer to "commercial grades."

	Cents per Lb.
Commercial 80-10-10 (1 per cent impurities)	17.31
Commercial 78 per cent metal	15.25
Commercial 81 per cent metal	15.574
Commercial 83 per cent metal	15.827
Commercial 85-5-5-5	16.086
Commercial No. 1 yellow brass ingot	12.861

The combined deliveries of brass and bronze ingots and billets by the members of the Non-Ferrous Ingot Metal Institute for September amounted to 7944 tons, according to announcement made by the institute today.

New Copper Refining Plant in Canada

A new $5,000,000 custom copper refining plant is being erected by the Ontario Refining Co. on a 40-acre site near Sudbury, Ont. It is anticipated that the plant will be in operation by January, 1931.

Three main buildings will be erected. The electrolytic cell house will be 300 x 400 ft. and will have 1200 reinforced concrete cells with lead linings. The casting buildings will be 200 x 400 ft. and will have three furnaces, each with a capacity of 450,000 lb. of copper. Both buildings will be of brick over steel construction. Associated in the Ontario Refining Co. are the International Nickel Co. of Canada, the American Metal Co., Consolidated Mining & Smelting Co. of Canada, and Ventures, Ltd.

Textiles and Coal Are More Active, Say Statisticians

Both production and distribution have been continuing well above last year's level, according to the October report of the Conference of Statisticians in Industry, operating under the auspices of the National Industrial Conference Board, New York.

Slight recessions in the iron and steel and automobile industries have been balanced in part by an increase in operations in several divisions of the textile group and in coal mining, due partly to seasonal influences. Bituminous coal production has been larger, since Aug. 1 than for the same period in any recent year except 1926.

Newspaper advertising continues to run well above last year's appropriations, indicative of optimism among dealers as regards available fall business.

While in several of the heavier industries stocks on hand are more than normal, indicating a slackening of demand in those particular commodities, this is ascribed to conservatism on part of buyers and as having obviated all danger of commodity price inflation.

September Sheet Output and Shipments Declined

The decreased demand for sheets due to the slowing down of the automotive industry is again reflected in the monthly report of the National Association of Flat Rolled Steel Manufacturers, which shows that there was less activity by independent mills during September in sales, production and shipments than in any pervious month this year. There was a rather sharp falling off in production and shipments as compared with August, but not much decrease in the tonnage booked. Sales were 274,568 tons, compared with 282,107 tons in the previous month. Production was 302,490 tons, against 366,734 tons in August while shipments declined from 365,649 tons in August to 301,330 tons last month. Unfilled orders also declined, having been 522,803 tons on Oct. 1, compared with 570,613 tons on Sept. 1. The September report and comparisons in net tons follow:

	September	August	July
Total number of mills.	715	722	723
Capacity per month	459,075	492,765	486,430
Percentage reporting	67.4	67.9	67.9
Sales	274,568	282,107	337,222
Production	302,490	366,734	323,905
Shipments	301,330	365,649	344,676
Unfilled orders	522,803	570,613	658,155
Unshipped orders	111,042	108,887	107,751
Unsold stocks	43,886	34,436	47,103
Percentages of Capacity			
Sales	88.7	84.4	102.2
Production	97.7	109.7	98.1
Shipments	97.4	109.4	104.4
Unfilled orders	168.9	170.7	199.4
Unshipped orders	35.9	32.6	32.6
Unsold stocks	14.2	10.3	14.3

River Movement of Iron and Steel Is Heavy

September movement of iron and steel products on the Ohio River amounted to 150,163 tons, another high record for this traffic, compared with 137,734 tons in August and 125,062 tons in September, 1928. On the Monongahela River, 135,773 tons of iron and steel was moved in September, compared with 134,426 tons in the preceding month and 136,227 tons in September, 1928.

Four 78-in. vortex collectors are to be provided for the Aliquippa plant of the Jones & Laughlin Steel Corporation by H. A. Brassert & Co., Chicago. They will be built by the American Blower Corporation. Capacity is 90,000 cu. ft. a minute each of blast furnace gas at 350 deg. Fahr.

Fabricated Structural Steel

Awards of 58,000 Tons Include 17,500 Tons for New York Hospital and 16,000 Tons for Philadelphia Station

FABRICATED structural steel lettings in the week, as reported to THE IRON AGE, totaled slightly more than 58,000 tons, compared with 23,000 tons in the preceding week. The amount added to pending work was nearly 38,000 tons.

The largest award was 17,500 tons for a hospital for the Cornell Medical Center, New York, taking 17,500 tons. A Chicago tower building accounts for 15,000 tons of the new work in the market. The Metropolitan Life Insurance Co. will soon ask for bids on a 100-story building in New York that will take 30,000 to 40,000 tons of steel.

Awards follow:

NEW HAVEN, CONN., 1300 tons, Sterling Law School and dormitories at Yale University, to Levering & Garrigues Co.

NEW YORK, 17,500 tons, New York Hospital for Cornell Medical Center, to Hedden Iron Construction Co.

NEW YORK, 1100 tons, apartment building at Seventh Avenue and Sixteenth Street, to Hedden Iron Construction Co.

NEW YORK, 1250 tons, 19-story apartment building on East Seventy-second Street, to Paterson Bridge Co.

NEW YORK, 1100 tons, American Museum of Natural History, to Easton Structural Steel Co.

STATE OF PENNSYLVANIA, 125 tons, highway bridge in Bedford County, to McClintic-Marshall Co.

MEDIA, PA., 700 tons, Delaware County Court House, to Lehigh Structural Steel Co.

PENNSYLVANIA RAILROAD, 16,000 tons, suburban terminal at West Philadelphia, to McClintic-Marshall Co.

YORK, PA., 350 tons, high school building, to Bauman Iron Works, Reading.

STATE COLLEGE, PA., 400 tons, building, to Anthracite Bridge Co., Scranton.

ARDMORE, PA., 300 tons, store for Strawbridge & Clothier, to Shoemaker Bridge Co.

MINEOLA, N. Y., 180 tons, Junior beams, Roosevelt Field hangars, to Jones & Laughlin Steel Corporation.

MORRISTOWN, N. J., 118 tons, Junior beams, Our Lady of Grace School, to Jones & Laughlin Steel Corporation.

BALTIMORE, 1200 tons, highway bridge, to Bethlehem Steel Co.

BIRMINGHAM, 220 tons, Woods-Chevrolet garage, to Virginia Bridge & Iron Co.

FRANKLIN, TENN., 450 tons, Allen Mfg. Co. plant, to Nashville Bridge Co.

EL PASO, TEX., 185 tons, Nichols Copper Co. power house, to Ingalls Iron Works.

STATE OF TEXAS, 500 tons, bridge for Wharton Bridge Co., to Virginia Bridge & Iron Co.

BRAZIL, SOUTH AMERICA, 400 tons, steel flume for a Brazilian electric company, to Virginia Bridge & Iron Co.

FLINT, MICH., 1500 tons, office building, to Flint Structural Steel Co.

LANSING, MICH., 965 tons, factory for Fisher Body Co., to Whitehead & Kales Co.

HAMILTON, ONT., 100 tons, Junior beams, Hamilton General Hospital, to Jones & Laughlin Steel Corporation.

PORTSMOUTH, OHIO, 112 tons, Junior beams, George D. Schudder School, to Jones & Laughlin Steel Corporation.

PORTSMOUTH, 100 tons, Junior beams, Harding Elementary School, to Jones & Laughlin Steel Corporation.

AKRON, OHIO, 3500 tons, bank and office building for Central Savings & Trust Co., to Berger Iron Works.

CHICAGO, 1200 tons, Ruth garage, to an unnamed bidder.

ST. LOUIS, 4500 tons, bridge for Missouri Pacific across Merrimac River, to an unnamed bidder.

EAST ST. LOUIS, ILL., 280 tons, buildings at Curtiss-Steinberg Air Field, to McClintic-Marshall Co.

SAN FRANCISCO, 100 tons, school, Turk and Ashbury Streets, to Dyer Brothers.

BURNABY, B. C., 500 tons, addition to plant of Dominion Bridge Co., owner to do fabricating.

VANCOUVER, B. C., 500 tons, telephone office building, to Western Bridge Co.

SEATTLE, 100 tons, sack house for Fisher Flouring Mills Co., to Isaacson Iron Works.

DENVER, 1200 tons, Twenty-third Street viaduct, to American Bridge Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

HARRISBURG, PA., 1700 tons, Farm Show Building; bids opened Oct. 23, original bids rejected as exceeding appropriation.

BOSTON, 2200 tons, Atlantic National Bank.

EDGEWATER, N. J., 800 tons, viaduct over Erie Railroad tracks for Ford Motor Co.'s new assembly plant.

PROVIDENCE, R. I., 1000 tons, Crawford Street bridge.

NEW YORK, 1000 tons, New York Trade School on East Sixty-sixth Street.

NEW YORK, 2400 tons, apartment building at Park Avenue and Seventy-third Street.

STATE OF NEW JERSEY, 600 tons, bridge over Passaic River.

WILMINGTON, DEL., 250 tons sheet steel piling, deep water power station for United Engineers & Constructors, Inc.

PHILADELPHIA, 5000 tons, municipal convention hall.

PHILADELPHIA, 500 tons, building for Stanley Co.

LEBANON, PA., 300 tons, building for Lebanon Steel Foundry Co.

NEWPORT NEWS, VA., 500 tons, building for Horace E. Dodge Boat & Plane Corporation.

LANSING, MICH., 1800 tons, R. E. Olds Co. bank and office building; Hunter Construction Co., Fon du Lac, Wis., general contractor.

SPRINGFIELD, ILL., 1500 tons, State buildings; J. B. French & Co., general contractors; Mississippi Valley Structural Steel Co., low bidder on steel.

CHICAGO, 1000 tons, apartment building.

NORTHERN PACIFIC, 800 tons, bridge work.

CHICAGO, 500 tons, 124th Field Artillery Armory; Mississippi Valley Structural Steel Co., low bidder.

CHICAGO, 15,000 tons, addition to building and tower of National Bank of the Republic.

OMAHA, NEB., 2000 tons, Union Pacific station; this is in addition to previous tonnage.

UNION PACIFIC RAILROAD, 300 tons, viaduct.

STURGEON BAY, WIS., 1340 tons, State highway bridge; bids Nov. 6.

KENOSHA, WIS., 300 tons, factory for Snap-On Wrench Co.

SACRAMENTO, CAL., 1337 tons, bridge over San Luis Rey River; bids opened.

SALINAS, CAL., 109 tons, two bridges for Monterey County; bids Oct. 21.

STOCKTON, CAL., 1000 tons, plant for Port Stockton Cement Co.; bids being taken.

International Standards Association Formed

WASHINGTON, Oct. 19.—The national standards bodies of 20 countries have made notable endeavor in recent years to establish a permanent international standards organization, according to M. H. Bletz, chief, Foreign Standards Section, Department of Commerce. As a result of this activity, organizations of 16 European countries now have agreed to establish the International Standards Association and have elected a president and secretary.

Early activities of the association, Mr. Bletz said, will be directed toward definite cooperation among the separate national bodies, standardization of methods and procedure, comparison of experience and results of investigations, and the coordination of activities when possible.

"International scientific organizations have given the world most of the existing international standards," said Mr. Bletz. "These are standards of time, length, weight, color and temperature, as well as basic standards for chemical, mechanical, physical and electrical elements. While the exigencies of international commerce required these standards, science or science in industry has actually been a few steps ahead of the demand.

"On the other hand, competition for world industrial supremacy, or, at least, the desire for leading positions in world commercial or industrial accomplishments, appears to act as a drawback to greater international uniformity in specifications for commodities. Apparently, until there is a greater equality in the producing methods in the different countries, industrial rivalry between nations will continue to delay a larger development of international commodity standards."

Interstate Stockholders Approve Sale

Stockholders of the Interstate Iron & Steel Co., Chicago, have formally approved the acquisition of the company by the Central Alloy Steel Corporation. The plan calls for the exchange of one and eleven fortieths shares of Central Alloy stock for each share of Interstate Iron & Steel common, of which there are 250,000 shares outstanding.

PERSONAL

JAMES P. ALLEN, president and general manager, Union Steel Casting Co., Pittsburgh, has resigned, effective immediately, and has been succeeded by JAN R. DUNSFORD, vice-president of the Lewis Foundry & Machine Co., Groveton, Pa., another subsidiary of

J. P. ALLEN

Q. S. SNYDER

the Blaw-Knox Co., Blawnox, Pa. Mr. Allen went with the Union company more than 27 years ago as sales manager and had been president and general manager since 1918. He began his business career with the American Steel Foundries, first at the Thurlow plant, Chester, Pa., and later as superintendent of the company's Alliance, Ohio, plant. He then went with the Union company. Mr. Allen has no definite plans for the future, but expects to spend the next six months in travel and rest. Mr. Dunsford became identified with the Lewis company two years ago, after having served as sales manager of the Wheeling Mold & Foundry Co., Wheeling, W. Va., where he was associated with Frank Cordes, now president of the Lewis company. When this company was acquired by the Blaw-Knox Co. a few weeks ago, Mr. Dunsford was made a director in the parent company. W. C. EICHENLAUB, secretary and sales manager of the Union Steel Casting Co., has also resigned and is now identified with the Pittsburgh Steel Foundry Corporation, Glassport, Pa., as sales manager. He became associated with the Union company 25 years ago and has served in his recent capacity for 12 years. C. H. LEHMAN has been elected secretary of the Union company to succeed Mr. Eichenlaub. GEORGE DAUMBAULD, assistant treasurer of the Blaw-Knox Co., has been made a director of that company.

—

Q. S. SNYDER has been elected president of the Pittsburgh Rolls Corporation, Pittsburgh, subsidiary of the Blaw-Knox Co., Blawnox, Pa., and has also been made a director in the parent company. He succeeds the late David L. Eynon as president of the Rolls corporation. Mr. Snyder went with the company 10 years ago as vice-president and became general manager three years ago.

—

A. D. BROWN, who has acted as special factory representative for the Pittsburgh transformer division of Allis-Chalmers Mfg. Co., Milwaukee, for the past year, has been appointed district manager of the Buffalo office of the company, succeeding M. W. PHELPS, who has resigned.

—

THOMAS I. S. BOAK, formerly superintendent of one of the plants of Goulds Pumps, Inc., Seneca Falls, N. Y., has been made works manager for all of the plants.

—

ROBERT L. WHEARLEY has been appointed manager of the Chicago office of the Dudlo Mfg. Co., wire manufacturer, Fort Wayne, Ind., succeeding R. A. CONNER, who has joined the sales department of the Inca Mfg. Co., Fort Wayne, Ind., wire manufacturer.

—

FRANK DUNSTAN and O. B. SCHMELTZ, sales engineers formerly located at the Putnam machine works, Fitchburg, Mass., of Manning, Maxwell & Moore, Inc., have been transferred to the Pittsburgh office to assist the Arch Machinery Co. in the sale of Putnam machine tools.

—

MAURICE M. WHELDON, recently identified with the Federal furnaces of the By-Products Coke Corporation, South Chicago, has been appointed assistant superintendent of blast furnaces for the Pittsburgh Steel Co., Monessen, Pa. Mr. Wheldon has had wide acquaintance with blast furnace operation, having gained his early ex-Jackson, Ohio, maker of high-silicon iron. Later he was identified for a short time with one of the Lavino furnaces in eastern Pennsylvania, but returned to the southern Ohio region to become superintendent of the Wellston Iron Furnace Co., Wellston. When this plant ceased to operate he went with the Federal furnaces.

—

L. H. UNDERWOOD, for four years superintendent of blast furnaces and coke plant at the Indiana Harbor, Ind., plant, Youngstown Sheet & Tube Co., has resigned.

—

W. C. WALLIS, who has been superintendent of blast furnaces at the Brier Hill works, Youngstown Sheet & Tube Co., Youngstown, has been made assistant general superintendent at that plant. P. D. CROMWELL, recently superintendent of the company's Hubbard, Ohio, blast furnaces, has been appointed superintendent of blast furnaces at the Campbell works.

—

L. J. VOYER, who has been New York district sales manager for the Newton Steel Co., Youngstown, has been transferred to the home office, where he will be identified with the general sales department. F. C. FLOOD, recently identified with the company's Cleveland sales office, succeeds Mr. Voyer at New York, and W. H. WILLIAMS, who has been in the Detroit office, succeeds Mr. Flood at Cleveland.

—

C. W. EDWARDS, formerly superintendent of rolling mills at the Indiana Harbor, Ind., plant, Youngstown Sheet & Tube Co., has been made assistant general superintendent at that plant. He has been identified with the company at that location for the last 12 years. GEORGE W. ABEL, who has been assistant superintendent of the slab mill at South Works, Illinois Steel Co., Chicago, has succeeded Mr. Edwards as superintendent of rolling mills at Indiana Harbor.

—

FRED L. FLANDERS, vice-president, Muskegon Motor Specialties Co., Muskegon, Mich., has been elected a director of the Sparta Foundry Co. He was formerly associated with the White Motor Co. and the Continental Motors Corporation.

—

MILTON GREENBERGER, president, Steel Mill Products Co., Chicago, has been elected president of the Appleton Steel Tube Co., Appleton, Wis. He succeeds JOHN M. BALLIET, who resigned because of poor health.

—

DAVID B. REEDER, formerly associated with the Keystone Driller Co., has been appointed metallurgist, with offices in the Oliver Building, Pittsburgh, of the Electro Metallurgical Sales Corporation, New York.

—

H. A. MASON, secretary of the Columbus Bolt Works Co., Columbus, Ohio, sailed on Oct. 19 for Europe. He will join J. R. POSTE, president of the company, who is now in London, and they will return in November.

W. R. EBERHARDT, who has been structural engineer for the H. K. Ferguson Co., Cleveland, has become manager of the New York office of the company.

—

E. J. LOWRY, consulting metallurgical engineer, Detroit, spoke on "A New Material: Still Called Cast Iron" at the first fall meeting of the Newark Foundrymen's Association, to be held at the Down Town Club, Newark, on Oct. 23.

—

GEORGE M. BECHTEL, heretofore of the Los Angeles office of Combustion Engineering Corporation, New York, has been made branch manager of the Seattle office of the company.

—

DON MCDANIEL, vice - president, Hamilton Foundry & Machine Co., Hamilton, Ohio, has been elected president of the Ohio Foundries Association, Inc., Cleveland.

DON MC DANIEL

FRANK A. WEIDMAN has been appointed manager of the wrought iron division of the Sharon Steel Hoop Co., Sharon, Pa., to handle the development and distribution of wrought iron sheets made from Byers new process wrought iron. The perfection of the Aston process for producing wrought iron on a tonnage basis makes wrought iron sheets available, after having been practically unobtainable for two decades or more. Mr. Weidman until recently was special representative for the Inland Steel Co., Chicago. Previous to that he was with the American Sheet & Tin Plate Co. at Pittsburgh.

—

H. W. LYNN, formerly connected with the Aetna-Standard Engineering Co., Youngstown, Ohio, has become manager of machine sales of the Wean Engineering Co., Inc., Warren, Ohio, engineer in sheet and tin mill equipment.

—

F. P. NORRIS, who has been identified with the Phoenix Iron Co., Philadelphia, for the past 40 years, for 28 of which he has served as manager, has been appointed a vice-president of the company.

A. E. UDELL has resigned his position as general purchasing agent of the Oliver Farm Equipment Co., Chicago, and plans to go to Florida for a short stay.

—

D. H. SMITH has been placed in charge of the Chicago office, at 221 East Twentieth Street, of Clark Brothers Bolt Co., Milldale, Conn.

—

J. L. RHOADS, who has been associated for many years with S. F. Bowser & Co., pump and tank manufacturers, Fort Wayne, Ind, has been appointed service manager for all territories in the United States except the San Francisco district.

Hardware Jobbers Adopt Trade Practice Rules

WASHINGTON, Oct. 22. — Approximately 90 per cent of the sales by hardware jobbers in 14 Southern States is estimated to have been represented either directly or indirectly at a trade practice conference held here on Friday of last week by the Southern Hardware Jobbers' Association with Commissioner Garland S. Ferguson, Jr., and Trade Practice Director M. Markham Flannery of the Federal Trade Commission. Sixteen rules were adopted. They covered the following subjects: Interference with contracts; misbranding; fraud and misrepresentation; substitution of quality; giving of secret rebates, gratuities or premiums; selling below cost or without profit; arbitration; defamation of competitors; enticement of employees; definition of qualified distributer; datings; continuance of conference; dumping; price discrimination; free deliveries; terms of sales.

X-Ray Studies of Wire Described

Work that is being done with X-ray studies applied to wire by the American Steel & Wire Co. was discussed by F. C. Elder, chief metallurgist, Cleveland district, of that company, at the first meeting of the season of the Cleveland chapter of the American Society for Steel Treating, at the Cleveland Engineering Society rooms, Oct. 15. The meeting was attended by the Canton-Massillon chapter.

The studies discussed applied to the cold working of wire. Some of the specimens were stretched on tensile machines and others were cold drawn in dies. The talk was illustrated by lantern slides of numerous X-ray photographs. Reductions up to 99½ per cent were made in the wire by a series of light drafts. Photographs showed the effects of annealing the cold-drawn wire for 1 hr. at temperatures ranging from 700 to 1600 deg. Fahr. Wire annealed at 700 deg. showed little change in structure. At 900 deg. it began to lose its fibering. Annealed at 1000 deg. it revealed the beginning of recrystallization and the number and size of crystals increased as the annealing temperature rose. Photographs showed that cold-drawn wire was well annealed at a temperature of 1600 deg. Studies of cold-drawn wire having an 80 per cent reduction were also discussed and illustrated.

In reply to questions Mr. Elder said that the use of the spectograph is a good method of showing a good normalized structure. Referring to the practical application of the X-ray at the present stage of the art, he said that he had found the method of advantage in solving difficult problems that did not yield to microscopic studies or other methods of investigation.

Nitriding Symposium in Special Volume

In a special edition of its *Transactions* the American Society for Steel Treating has just published the complete proceedings of the memorable symposium on nitriding which was a feature of its eleventh annual convention during the National Metal Congress in Cleveland in September. The edition contains 222 pages, which include each of the eight papers and the special address by Dr. Adolph Fry of Germany, inventor of the process, who was present at the meeting. There is also a report of the written and oral discussions.

As an introduction there is a statement on behalf of the officers and board of directors by Dr. Zay Jeffries, president, and W. H. Eisenman, secretary, giving the reasons for printing this special issue. In the ordinary course of procedure the various papers would have been printed in the monthly issues of the *Transactions*. The statement also expresses appreciation to W. B. Coleman for the organization of the symposium, to Dr. George B. Waterhouse chairman of the sessions, and to the authors of the papers and those who contributed to the discussions.

The edition includes photographs of the chairman and vice-chairman of the sessions, and of Adolph Fry and Pierre Aubert, honorary vice-chairmen.

Copies of this symposium are available at $3 each, bound in cloth, postpaid in the United States, and $3.50 postpaid to foreign countries.

Obituary

HOWARD SELLERS, formerly a director of William Sellers & Co., Inc., machine tool builders, Philadelphia, died at his home at Wynnewood, Pa., on Oct. 14, aged 72 years.

—

CHARLES B. SALMON, founder of the Eclipse Windmill Co., which formed the nucleus of the Fairbanks, Morse & Co. industrial organization, died at his home in Beloit, Wis., on Oct. 15, aged 79 years. He was identified with the establishment and management of numerous other large industrial enterprises and was noted for his charities and philanthropies.

September Automobile Production Down

Output of Nine Months Exceeds That for Any Previous Full Calendar Year, in Total, in Passenger Cars and in Trucks

WASHINGTON, Oct. 21.—Totaling 415,332 units, production of motor vehicles in the United States in September was the lowest since January, when the output was 401,037 units, according to reports received by the Department of Commerce. Production of passenger cars in September was 364,786, also the lowest output since January, with 347,382. Motor truck output in September was 49,681, the lightest since last December, with a total of 28,123. Production of taxicabs in September was only 865, the smallest since last November, with a total of 700.

August production of motor vehicles totaled 498,361 units, the September production showing a decline of 83,029, or 17 per cent. Passenger car output in August was 441,942, the decrease for September being 77,156. Production of trucks in August was 55,379, the September decline being 5698.

For the nine months of the current year production of motor vehicles was 4,637,471 units, an increase of 1,167,252 over the 3,470,219 in the corresponding period of last year. The current total was higher than in any previous complete calendar year.

Passenger car production increased to 4,005,177, a gain of 945,239 over the 3,059,938 vehicles in the first nine months of 1928, and higher than in any previous 12-month. Truck production rose to 618,702 units, an increase of 212,739 over the 405,963 of the first nine months of last year, and again higher than in any previous full year.

Canadian motor vehicle production in September was 13,817 units, the smallest since last December, with a total of 9425. The August output was 14,214. Passenger car production in September was 10,710 and truck production was 3107, each the lowest since last December, with totals of 6734 and 2691 respectively. August production was 11,037 and 3177 respectively.

Total Canadian production for the nine months of 1929 was 233,853, against 202,652 for the corresponding period of last year. Passenger car output was 186,960 and 168,837 respectively, while the respective figures for truck production were 46,893 and 33,815.

Pittsburgh Barge Rates to Southwest Reduced

The American Barge Line, operating a line of barges between Pittsburgh, New Orleans and intermediate ports, and also ports on the upper Mississippi River, has announced new through rates on iron and steel articles from the Pittsburgh district to western Louisiana, Texas, Oklahoma and Arkansas. These new rates will represent a net saving to shippers of $2.20 a net ton as compared with the present all-rail rate. The American company will also soon publish a Pittsburgh terminal tariff, absorbing switching and barge loading charges in that district. The new reduced rates are to hold on pipe as well as other iron and steel articles and will be effective Dec. 1.

Record Freight Traffic with Less Equipment

While the loading of revenue freight in the United States during the first seven months of the year was a new high record for that period, reaching more than 30,000,000 cars, this enormous traffic is reported by the car service division of the American Railway Association to have been handled with fewer freight cars and locomotives than have been used at any time since 1923. The number of freight cars owned by Class I railroads July 1 was 2,266,069, a reduction of 34,600 in two years.

Average capacity of the units has been increasing steadily, the freight cars having advanced from 43.1 tons five years ago to 46.1 tons. In addition, there has been more intensive use of the individual cars. There has also been a decline in the number of locomotives owned, but the average tractive power of the units has gone up. This is now reported at 43,985 lb., compared with 38,217 lb. seven years ago.

Much Industrial Machinery Shipped to Canada

WASHINGTON, Oct. 19.—In a report relating to the market for industrial machinery in the Canadian prairie provinces of Manitoba, Saskatchewan and Alberta, Consul General P. S. Heintzleman, Winnipeg, points out that the principal classes of this class of equipment imported into the three provinces are mining machinery, pulp-mill and paper-mill machinery and road-building machinery. The report has been made public by the Industrial Machinery Division, Department of Commerce.

Separate figures for imports into the provinces are not available, but it is estimated that, of the total of more than $49,220,000 of strictly industrial machinery shipped from the United States to Canada in 1928, one-fourth was destined for use in the prairie provinces. A steadily increasing volume of trade is expected, although manufacturers in Canada, it was declared, are becoming more desirous of meeting the country's requirements and equipment is gradually being installed for the manufacture locally of the different lines, thus increasing competition for the American product.

Other competitors are principally the United Kingdom and, to a much less extent, Germany, Sweden, France, Norway and Switzerland. Pulp-mill machinery, coke and gas-producing machinery, textile machinery and briquette-making machinery are the items principally involved in this competition.

Mr. Heintzleman reported that, since one-tenth of the population of the prairie provinces is American-born, and further because of the proximity of the provinces to the United States and the easy access between the peoples of the two countries, there is naturally a marked preference for industrial machinery of American manufacture. The report deals at some length with the best methods for American manufacturers to follow in building up the markets in the provinces.

COMING MEETINGS

OCTOBER

Society of Industrial Engineers. Oct. 23 to 25. Sixteenth national convention, Hotel Statler, Cleveland. George C. Dent, 205 West Wacker Drive, Chicago, secretary.

American Gear Manufacturers Association. Oct. 24 to 26. Fall meeting, Benjamin Franklin Hotel, Philadelphia. T. W. Owen, 3608 Euclid Avenue, Cleveland, secretary.

American Iron and Steel Institute. Oct. 25. Thirty-sixth general meeting, Hotel Commodore, New York. E. A. S. Clarke, 75 West Street, New York, secretary.

American Management Association. Oct. 29 to Nov. 1. Fall meeting, Hotel Statler, Detroit. W. J. Donald, 20 Vesey Street, New York, managing director.

NOVEMBER

Open-hearth Committee of American Institute of Mining and Metallurgical Engineers. Nov. 5 and 6. Semi-annual meeting, Hotel Stevens, Chicago. Leo F. Reinartz, American Rolling Mill Co., Middletown, Ohio, chairman.

International Acetylene Association. Nov. 13 to 15. Annual meeting, Congress Hotel, Chicago. A. Cressy Morrison, 30 East Forty-second Street, New York, secretary.

American Institute of Steel Construction. Nov. 13 to 16. Annual meeting, Edgewater Gulf Hotel, Biloxi, Miss. Charles F. Abbott, 200 Madison Avenue, New York, executive director.

National Founders' Association. Nov. 20 and 21. Annual meeting, Hotel Astor, New York. J. M. Taylor, 29 South LaSalle Street, Chicago, secretary.

Quiet Prevails in European Markets

Even Pig Iron Is Less Active—Japan Has Expanded Operations—Russia Seeks More Technical Assistance

(*By Cable*)

LONDON, ENGLAND, Oct. 21.

PIG iron is quiet and Cleveland makers are becoming apprehensive of the future. Ironstone miners are pressing for a wage advance, but the mine owners are unwilling to discuss the question at present, as costs are still very high.

Export sales of Cleveland iron are negligible and foreign basic iron is again arriving in small tonnages for British consumers. Meanwhile, Cleveland makers have sold their October output, but have no forward contracts, and it is possible that some furnaces may be blown out at a later date.

Hematite makers are securing business at unprofitable prices, but are unable to advance the market, as French hematite is again competing.

Finished steel is quiet, but mills are busy on orders received prior to the latest steel makers' meeting, and specifications are coming in freely.

Tin plate is quiet, both manufacturers and consumers being disturbed by the recent set-back in the tin market, so that business is only moderate. Demand is good for light weight 14 x 20-in. wasters for the Far East and supplies are scarce, but other business is quiet although inquiry is well maintained.

Galvanized sheets are weak on poor demand and reduced costs of production in the form of lower priced sheet bars and spelter. Black sheets are dull.

Continental iron and steel markets are weak, with mills eagerly seeking business. Some British users of foreign sheet bars have placed orders, but the tonnage has been small. Finished steel is especially quiet in the absence of good export demand.

Czechoslovakian production in August was 137,000 metric tons of pig iron, and 185,000 tons of raw steel. French production in August was 893,000 metric tons of pig iron and 872,000 tons of raw steel. At the end of August 156 French furnaces were in blast. German pig iron output in September was 1,109,000 metric tons with 100 furnaces in blast at the end of the month.

British Trade Remains Quiet —Foreign Prices Lower

LONDON, ENGLAND, Oct. 11.—The iron and steel markets continue dull and there is but slight indication of a change for the better. The volume of new tonnage on mill books, except in pig iron, is not sufficient to maintain better than part-time operation. Blast furnaces, however, are generally well sold ahead and in some cases have advanced prices. The Cleveland producers have not as yet altered quotations, but are expected to do so shortly, as costs of production are increasing. A deterrent is the fact that they are seeking to increase export sales, and foreign users are reluctant to pay even the present prices. Domestic pig iron demand is good, but Continental iron, while still imported in special cases, is generally not an attractive proposition.

In the semi-finished market the rapid decline in the price of foreign billets and sheet bars is affecting domestic producers. British mills have for some time had a fair share of this business, but Continental competitors are becoming more active. However, Continental mills are in need of orders for prompt and early shipment, while British consumers are generally well covered on their immediate requirements and are seeking supplies for next year only.

Export trade is quiet. It is reported that a moderate amount of Canadian business in finished material has been booked as a result of efforts by the Steel Makers' Export Committee, and some business has been received from Japan. While prices are not disclosed, it is known that the market must be shaded considerably to meet Continental competition.

Returns of the Clyde shipbuilding industry for September were small, and the volume of new ship construction contracts is not good, so that shipyards are not likely to require large quantities of ship steel in the near future. There are, however, large electrical, structural and railroad projects, which call for substantial quantities of steel and other material.

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

British Prices, f.o.b. United Kingdom Ports

Cleveland No. 3 foundry	£3 12½s.	to £3 13½s.	$17.58 to $17.82
East Coast hematite	3 16½	to 3 17	18.51 to 18.63
Ferromanganese, export	13 10	to 14 0	65.47 to 67.90
Billets, open-hearth	6 5	to 6 7½	30.31 to 30.92
Sheet bars, open-hearth	6 5	to 6 10	30.31 to 31.52
Black sheets, Japanese specifications	12 12½		61.22
Tin plate, per base box	0 19	to 0 19¼	4.60 to 4.66
Rails, 60 lb. and heavier	7 15	to 8 15	37.59 to 42.43
			Cents per Lb.
Steel bars, open-hearth	7 15	to 8 10	1.67 to 1.84
Beams, open-hearth	7 2½	to 7 12½	1.55 to 1.65
Channels, open-hearth	7 7½	to 7 17½	1.60 to 1.71
Angles, open-hearth	8 2½	to 8 12½	1.76 to 1.86
Ship plates, open-hearth	7 12½	to 8 2½	1.66 to 1.76
Black sheets, No. 24 gage	10 0	to 10 5	2.17 to 2.21
Galvanized sheets, No. 24 gage	13 0	to 13 7½	2.81 to 2.89

Continental Prices, f.o.b. Antwerp or Hamburg

Foundry iron, 2.50 to 3.00 per cent sil., 0.50 to 0.90 per cent phos.	£3 8s.	to £3 11½s.	$16.49 to $17.33
Foundry iron, 2.50 to 3.00 per cent sil., 1.00 per cent and more phos.	3 8	to 3 10	16.49 to 16.97
Billets, Thomas	4 13	to 4 15	22.65 to 23.03
Sheet bars, Thomas	4 13	to 4 14	22.65 to 22.79
Wire rods, low C., No. 5 B.W.G.	6 5	to 6 6¼	30.30 to 30.61
Black sheets, No. 31 gage, Japanese	12 6	to 12 7½	59.65 to 60.02
Rails, 60 lb. and heavier	6 8½	to 6 10*	31.16 to 31.52
Rails, light	6 1½		29.46
			Cents per Lb.
Steel bars, merchant	5 2	to 5 3	1.10 to 1.11
Steel bars, deformed	5 1	to 5 2	1.09 to 1.10
Beams, Thomas, British standard	4 19	to 5 3	1.07 to 1.11
Channels, Thomas, American sections	5 14	to 5 18	1.24 to 1.27
Angles, Thomas, 4-in. and larger, over ⅝-in. thick	5 0		1.10
Angles, Thomas, 3-in.	5 7		1.15
Ship plates, open-hearth inspected	7 8		1.63
Hoop and strip steel over 6-in. base	5 10	to 5 12	1.19 to 1.21
Wire, plain, No. 8 gage	7 4	to 7 5	1.58 to 1.59
Wire, galvanized, No. 8 gage	8 17½		1.91
Wire, barbed, 4-pt. No. 12 B.W.G.	11 5		2.48
Wire nails, base	7 10	to 7 10½	$1.62 to $1.63 per keg
Wire nails, assortments, 1 to 6-in., keg	10 6½		2.23

*Open-hearth steel, 10s. ($2.42) per ton extra.

Germany Imports Scrap Cans for Detinning

HAMBURG, GERMANY, Oct. 7.—Detinning of scrap tin plate in Germany is handicapped by a shortage of scrap and a diminishing recovery of tin, as a result of improved methods of plating, which provide a thinner tin coating. Recently scrap tin cans have been imported from the United States, Great Britain, Australia and the Far East. Some increase in the supply available for detinning is expected from the decision of certain municipalities to devote more attention to classifying this part of their scrap separately.

Most of the detinning in Germany is done by one company, Goldschmidt of Essen. Although the coating of tin plate is thinner than formerly, profits from the detinning process have continued at about the same level, following improvements in the method of recovering the tin. While accurate statistics are not available, it is estimated that about 14.5 kg. 32 lb.) of tin per metric ton of scrap is recovered. The total production of tin by this method in 1928 was about 2,755,000 lb., or 1250 metric tons.

Iron and Steel Output of Hungary Increasing

WASHINGTON, Oct. 18.—Increased demand from the Hungarian machinery industry and greater exports caused an increase in the production of both pig iron and crude steel during the first six months of 1929, according to a report received by the Department of Commerce from Budapest. Output of pig iron for the first half of the current year was 184,320 metric tons, compared with 136,857 tons for the first half of last year. Crude steel production was 241,440 tons, compared with 223,500 tons.

Scrap Prices Reduced in Germany

HAMBURG, GERMANY, Oct. 7.—Prices of iron and steel scrap have again been reduced. No. 1 heavy melting steel is now quoted at 64 m. ($15.23) per metric ton, delivered. Other grades of scrap have also been reduced 1 to 2 m. (24c. to 48c.) per ton. During August imports of scrap totaled 47,000 tons, but there is an abundant supply, and importation is expected to decline at the new prices.

Belgian Exports Light—Electrical Merger Near

BRUSSELS, BELGIUM, Oct. 2.—Steel export business in the past fortnight has been quiet and the price per gross ton for steel bars, f.o.b. Antwerp, has declined to £5 7s. ($25.95), which is 5s. ($1.21) per ton below the price at the end of August. Except for some small orders from Argentina, little foreign business has been booked. Business is fairly good in semi-finished material, but lack of demand for finished products may cause slight curtailment by some mills. Iron and steel scrap prices have weakened slightly. Export prices are low, and Belgian sellers have been unable to obtain business in South American markets and Japan except by offering concessions.

German Chemical Industry May Make Rustless Iron

HAMBURG, GERMANY, Oct. 7.—It is currently reported that the I. G. Farben A. G., the German Dyestuffs Corporation, is planning the establishment of a rustless iron division, which will manufacture equipment for use in the chemical industry. The use of rustless iron in the chemical industry has become so large that it is believed that a plant manufacturing equipment under the Krupp-Nirosta patents would be profitable.

German Cable Makers May Build American Plant

HAMBURG, GERMANY, Oct. 7.—A cooperative export corporation has been established in Berlin by 10 German cable manufacturers. While the new company will handle sales of cable to foreign markets, its principal purpose is understood to be the establishment of plants in foreign countries where duties are too high to permit cable imports. At present the new company is considering plans for a cable manufacturing plant in the United States. Exports of cable from Germany this year have averaged 5000 tons a month.

Japan's Pig Iron Output 753,591 Tons in Half

YOKOHAMA, JAPAN, Sept. 11.—The leading producers of pig iron in Japan are the Government Steel Works and the South Manchuria Railroad Co. Of 753,591 metric tons of iron produced in the first half of this year, the Government works output was 403,779 tons and the South Manchuria Railway Co.'s production 111,368 tons. Other producers were the Mitsubishi Steel Co. with 76,804 tons, Japan Steel Works with 57,912 tons, Okura Mining Co. with 28,145 tons and the Asano Shipbuilding Co. with 29,281 tons.

Despite this heavy production of pig iron, importation is necessary. The Government Steel Works program for 1930 calls for a steel production of more than 1,350,000 metric tons, while its pig iron capacity is not more than 860,000 tons.

Czech Iron Output Rises

WASHINGTON, Oct. 15.—Production of pig iron in Czechoslovakia in August increased to 138,000 tons, but steel production decreased to 185,000 tons, according to a cablegram received by the Department of Commerce from Prague.

Japanese Sheet Exports Reach Many Markets

YOKOHAMA, JAPAN, Sept. 11.—Exports of galvanized sheets from Japan in August totaled 5028 metric tons, of which 3187 tons was flat sheets and 1840 tons corrugated. The official statistics are given in number of sheets, and the totals with destinations were as follows: To South Sea countries, 505,402 sheets; to China, 225,617 sheets; Kwantung Province, 225,010 sheets; Siam, 147,142 sheets; Manchuria, 41,499 sheets; Hong Kong, 40,700; British India, 15,626; Philippines, 5800, and to Asiatic Russia, 5600 sheets. The total was 1,212,296 sheets, or 5028 metric tons.

German Mills to Issue New List of Extras

DÜSSELDORF, GERMANY, Oct. 7.—Rolling mills are preparing a new list of extras on steel bars and shapes for export. For some time the extras charged have not corresponded to the standard list by several shillings a ton. For example, on 3/16-in. bars the standard size extra is 25s. per ton (27.5c. per 100 lb.), and on ¼-in., the average standard extra is 17s. 6d. a ton (19.5c. per 100 lb.). On recent export business the usual extra on both sizes has been about 10s. per ton (10.9c. per 100 lb.). Extras charged on light angles, tees and other shapes are also less than the present standard list.

Britain May Exceed Rail Quota with New Contract

HAMBURG, GERMANY, Oct. 7.—The agreement between Great Britain and Argentina, under which about £8,000,000 ($38,800,000) of rails and railroad material will be placed with British mills, may lead to Britain's exceeding its quota in the International Rail Manufacturers' Association. As British mills, under the agreement, will receive all rail orders placed by Argentina, the British allotment in the association may be exhausted soon and orders from the British dominions and colonies would be in excess of the quota. Meanwhile, Belgian and Luxemburg mills have declared themselves opposed to any increase in the allotment of a member.

German Mannesmann Not in Control of Saar Mill

The recent report from Germany that the German Mannesmann Tube Co. had acquired control of 65 per cent of the stock of the French Mannesmann mill, Acieries et Usines a Tubes de la Sarre, is stated to be incorrect by Louvroil & Recquignies, Paris. This company owns 34 per cent of the stock of the Mannesmann mill in the Saar and states that other French tube manufacturers control 26 per cent, while the German Mannesmann company owns the remaining 40 per cent.

More Russian Agreements with American Companies

HAMBURG, GERMANY, Oct. 7.—At a recent meeting of delegates from the South Russian Chambers of Commerce and German manufacturers, the head of the Russian foreign trade department, the Gurewitch, outlined the status of technical assistance agreements in Russia. In the past four years, he said, 71 such agreements had been made, of which 30 were with German companies, 17 with American and the rest with British, Swedish and French organizations. He pointed out that the trend is toward more agreements with American companies, because they are less secretive about improvements in their plants than companies in Germany and other countries.

Spiegeleisen Imports Mainly from Britain

Of the total imports of 11,243 gross tons of spiegeleisen into the United States to Aug. 1, this year, 10,868 tons came from Great Britain and 375 tons from Germany.

Of the 10,868 tons of British alloy, 3543 tons was received through the port of New Orleans, 2550 tons through the port of Philadelphia, 2235 tons through ports in Maryland, 2000 tons at Chicago, 240 tons through ports in Massachusetts, 135 tons at Los Angeles, 90 tons through ports in Washington, 50 tons through New York and 25 tons at San Francisco. The 10,868 tons of British alloy had a valuation of $314,490, or $28.94 per ton. The 375 tons of German alloy had a valuation of $12,320, or about $32.85 per ton. All of it came through the ports of San Francisco and Los Angeles.

German Rail Prices Cut

HAMBURG, GERMANY, Sept. 30.—The official price of £6 17s. 6d. ($33.34) a ton for rails was left unchanged by the International Rail Makers' Association at its recent meeting in Vienna, but German mills, which sold rails at £7 ($33.95) a ton during the second and third quarters of this year, have reduced their price to £6 18s. 6d. ($33.58) a ton, which is still 1s. a ton more than the official price. Mills continue to report satisfactory business in rails.

Swedish Sponge Iron Plant Increases Capacity

The Höganäs Co. of Sweden, maker of sponge iron, considerably increased its capacity during the spring and summer because of an increased demand for its product. It is stated that recently orders were so heavy, during rebuilding of the plant, that new business could not be accepted. Importers in this country have received word that the new units for producing sponge iron have had their trial run and are now in satisfactory condition to proceed with production. In the proposed new tariff sponge iron has been listed in a special paragraph for a duty of $2 per ton; under the present tariff it comes in under the same duty as pig iron.

Soviet to Adopt American Coal Mining Methods

The Donugol Coal Trust, the largest coal mining unit in the U. S. S. R., operating about 300 mines in the Donetz Basin, has concluded a fourth technical assistance contract with an American company. The new agreement, which is with Stuart, James & Cooke, Inc., New York, provides for assistance in increasing the efficiency of operation in the mines and plants.

This is the first contract of its kind made by a Russian Government organization, 30 other technical agreements having been for designing or building new plants. Stuart, James & Cooke, Inc., is already acting as a consultant for the Moscow Coal Trust and other coal companies in Russia.

Large Laboratories for Research in Canada

Large research laboratories have been authorized by the Dominion Government of Canada. The initial expenditure for these laboratories was fixed at $1,000,000, but it is now intended to proceed with the whole enterprise at a cost of $3,000,000. Tenders for the laboratory building, which is to be built in Ottawa, will soon be asked for, the specifications having been already prepared by the architects.

G. S. Whitby, professor of organic chemistry, McGill University, Montreal, will be director of the department of industrial chemistry. R. W. Boyle, professor of physics and dean of the faculty of applied science at the University of Alberta, will be director of the department of physics and engineering physics. J. H. Parkin, associate professor of mechanical engineering at the University of Toronto, will be assistant director of the department of physics and engineering physics in charge of aeronautical research.

To Expand Aluminum Output

HAMBURG, GERMANY, Oct. 7.—Further expansion of aluminum production in Germany is in prospect, and the Lautawerk, the largest producer, has made preliminary plans for another plant, with a capacity of 8000 to 10,000 tons a year. It is estimated that consumption of aluminum in Germany this year will total about 41,000 metric tons, compared with 37,800 tons in 1928, and that production will be about 35,000 tons, compared with 30,500 tons in 1928. An effort is being made to supply all German aluminum requirements from domestic production. It is noteworthy that in 1913 production of aluminum in Germany was only 1000 tons and consumption was 13,300 tons.

German Copper Output Up in August

HAMBURG, GERMANY, Sept. 30.—Copper production in Germany reached a new record in August with a total of 10,214 metric tons, compared with 9752 tons in July. Of the August output, 5130 tons was smelted from German ores.

Brazilian Steel Industry

Active development work in extracting iron ore from deposits in the State of Minas Geraes, Brazil, is reported to be in progress by the Itabira Iron Ore Co. This organization holds a concession from the Brazilian Government which requires prosecution of the work, according to the United States commercial attaché at Rio de Janeiro. To reach the ore beds, engineers are locating a route for new sections of the Victoria-Minas Geraes Railroad. Preliminary work on docks is under way at the port of Santa Cruz and also on the mining plant itself in the Doce River district.

The simplified practice recommendation for woven wire fencing has been reaffirmed. The pamphlet covering this recommendation may be obtained for 5c. from the Superintendent of Documents, Washington.

Machinery Markets and News of the Works

Sales Show Improvement

Individual Orders Have Been Small, But Have Come from Almost All Consuming Lines

AGAIN in sales is reported by some machine tool builders who booked considerable business the past week.

However, there is a noticeable absence of buying on a large scale, individual orders having consisted largely of from one to three machines each. With the exception of the automobile industry, where tool purchases are almost at a standstill, bookings have been drawn from almost all consuming industries.

Despite the past week's improvement, the volume of business is lagging somewhat behind that in September. Production is not being affected, for the industry's backlog will carry operations along at capacity until well into next year.

An automobile truck maker has expended $35,000 for tools and a company in the Detroit district has bought four large automatic lathes from a Cincinnati builder. The Worthington Pump & Machinery Corporation is expected to contract for upward of $60,000 worth of equipment in the near future.

Among recent purchases by the Amtorg Trading Corporation for a tractor plant in Soviet Russia were a large number of presses from an Ohio manufacturer.

The United States Aluminum Co. has issued a supplementary list of tools which it will buy for its New Kensington, Pa., plant. The A. M. Byers Co. may inquire for machinery and other equipment for its Ambridge, Pa., works in the next few weeks, although purchases will be delayed until late in the year.

The Western Electric Co. continues to contract for large quantities of machine work and jobbing shops in the Chicago district are profiting from this situation.

New York

NEW YORK, Oct. 22.—Machine tool sales are holding up fairly well. Inquiries are in promising volume. A motor truck manufacturer has placed orders for upward of $35,000 worth of equipment. The Worthington Pump & Machinery Corporation, Harrison, N. J., is expected to close shortly on about $65,000 worth of tools.

Queens County Motor Car Co., 103 Arleigh Road, Douglaston, N. Y., has plans for a six-story service, repair and garage building at Briarwood, N. Y., to cost more than $200,000 with equipment. Henry C. Brucker, 2424 Myrtle Avenue, Brooklyn, is architect.

New York Edison Co., Irving Place and Fifteenth Street, New York, has arranged a fund of $40,500,000, out of total appropriation of $80,000,000 for new construction, for extensions and improvements in transmission and distributing lines, including underground conduit installation and network systems.

United States Electric Mfg. Corporation, 222 West Fourteenth Street, New York, manufacturer of electrical equipment, has leased building at 154-56 West Nineteenth Street, for expansion.

Curtiss Flying Service, Inc., 39 Broadway, New York, will soon begin work on new airport near municipal airfield at Los Angeles, including eight steel hangars, machine and repair shop, laboratories, school for students and other field units, to cost over $1,000,000 with equipment.

American Radiator & Standard Sanitary Corporation, 40 West Fortieth Street, New York, is closing negotiations for acquisition of C. F. Church Mfg. Co., manufacturer of plumbing and bathroom fixtures, etc., and will consolidate. Purchased company has plants at Washington, N. J., Holyoke, Mass., and Brattleboro, Vt., all of which are to be continued. Expansion is planned.

Phono-Kinema Syndicate, Inc., 729 Seventh Avenue, New York, manufacturer of sound equipment for motion pictures, etc., has arranged for sale of 100,000 shares of common stock, part of proceeds to be used for expansion in production.

Yankee Metal Products Co., 200 Fifth Avenue, New York, has leased floor in building at 460 West Thirty-fourth Street for expansion.

Board of Education, Park Avenue and Fifty-ninth Street, New York, has purchased property at St. Marks Place, Wall Street and Belmont Place, St. George, S. I., as site for new vocational school to cost over $500,000, for which plans will be drawn by W. C. Martin, school architect, Flatbush Avenue Extension and Concord Street, Brooklyn.

Continental Can Co., 1 Pershing Square, New York, has purchased Nashville Corrugated Box Co., Nashville, Tenn., manufacturer of corrugated shipping containers, etc., and will operate as unit of organization. Expansion in output is planned. Company has also merged with Owens-Illinois Glass Co., Toledo, Ohio, manufacturer of glass containers. A new company has been formed to operate consolidated organization under name of Continental Containers, Inc. Increase in present manufacture is planned.

Thomas A. Edison, Inc., West Orange, N. J., has awarded a general contract to Austin Co., New York, for new plant on Kearny meadows, Kearny, N. J., to manufacture storage batteries, comprising four one and two-story units, 120 x 280 ft.; 60 x 90 ft.; 30 x 47 ft.; and 80 x 80 ft., last-noted to be used as power house, to cost $220,000 with equipment.

Ford Motor Co., Detroit, has asked bids on general contract for new assembling plant at Edgewater, N. J., to replace works at Kearny, N. J., recently sold to Western Electric Co. Main unit will be two stories, 360 x 1500 ft., with steam power house, 50 x 113 ft., and auxiliary units, to cost over $1,000,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Board of Freeholders of Passaic County, Court House, Paterson, N. J., is considering County airport on Paterson-Hamburgh Turnpike, Preakness, consisting of hangars, repair shop, oil storage and other mechanical units, to cost $200,000 with equipment.

Tungsten Electric Co., Union City, N. J., has been formed to take over and consolidate International Wire Co., Inc., Callite Products Co., Precision Metal Products Co., Independent Contact Mfg. Co., all with plants at 540 Thirty-ninth Street, Union City. New company is arranging for sale of stock to total $955,000, part of fund to be used to carry out merger and for expansion in output.

United States Rubber Co., Broadway and Fifty-eighth Street, New York, has asked bids on general contract for a five-story and basement plant, 110 x 425 ft., at Paterson, N. J., to cost about $800,000 with equipment. Lockwood Greene Engineers, Inc., 100 East Forty-second Street, New York, is architect and engineer.

Manufacturers Electro-Plating Co., 303 New Brunswick Avenue, Perth Amboy, N. J., has opened a plant to engage in general plating, specializing in chromium and cadmium plating.

International Stamping & Enameling Corporation, 360 Furman Street, Brooklyn, has been organized to manufacture enameled products, especially for hospitals and sick rooms. It plans to purchase controlling interests in stamping

companies equipped to do such work and has acquired a major interest in one such company and is negotiating with others. It will also purchase dies and stamping machinery for products for which it can create a market.

South Atlantic

BALTIMORE, Oct. 21.—Bids will be asked early in November by Stonleigh Stores Corporation, 810 North Charles Street, Baltimore, for five-story automobile service, repair and garage building, with addition of three stories underground, 190 x 194 ft., to cost $1,500,000 with equipment. Wyatt & Nolting, Keyser Building, are architects.

Public Improvement Commission, City Hall, Baltimore, is considering installation of manual training equipment in four-story junior high school on Harrington Road, for which bids will be asked on general contract in 60 to 90 days, to cost $1,000,000. Smith & May, Calvert Building, are architects.

Automatic packing machinery, conveying, elevating and other equipment will be installed in four and six-story addition to plant of American Tobacco Co., Richmond, Va., 128 x 270 ft., to cost about $2,500,000, of which more than $1,500,000 will be used for machinery. A steam power house with capacity of 2000 hp. is also under consideration. J. E. Sirrine & Co., Greenville, S. C., are architects and engineers. Executive offices of company are at 111 Fifth Avenue, New York.

Curtiss Flying Service, Inc., 39 Broadway, New York, is planning construction of hangar, with repair and reconditioning facilities, at municipal airport at Columbia, S. C., to cost about $100,000 with equipment.

Bedford Pulp & Paper Co., Mutual Building, Richmond, Va., has begun construction of steam-operated electric power plant at mill at Big Island, Va., to cost over $100,000 with equipment.

Anchor Post Fence Co., Eastern Avenue and Kane Street, Baltimore, manufacturer of iron fencing, has purchased plant and business of Fluid Heat Corporation, 2637 Greenmount Avenue, manufacturer of oil burning equipment and devices, and will consolidate. New line of manufacture will be continued and it is proposed to remove acquired plant to main works where expansion will be carried out and department established for oil burner production. J. R. Ellison is production manager in charge.

William Hellbach & Co., 409 Aisquith Street, Baltimore, plumbing and heating equipment and supplies, have awarded general contract to West Construction Co., Knickerbocker Building, for two-story storage and distributing plant with shop, to cost about $30,000 with equipment. Kubitz & Koenig, Emerson Tower Building, are architects.

Proctor Mfg. Co., Baltimore, has been organized to take over and operate Proctor Screen & Weatherstrip Co., with local plant at 3601-11 Elm Avenue. Plans are under way for extensions and installation of additional equipment.

Pitcairn Aviation, Inc., Land Title Building, Philadelphia, has awarded general contract to Birmingham Construction Co., 1612 North Thirty-fourth Street, Birmingham, for hangar, 120 x 120 ft., at airport at Atlanta, Ga., with repair facilities, to cost about $65,000 with equipment. John K. Ottley, Jr., Fourth National Bank Building, Atlanta, is company representative in charge.

The Crane Market

THE volume of inquiry for locomotive cranes has increased in the past week, but buying has been small. Stevens & Wood, Inc., engineer, New York, has closed on a locomotive crane for the Saginaw River development in Michigan and the New York Central Railroad has purchased a 25-ton locomotive crane for use in Ohio, but still has pending a 25-ton, gasoline driven crane for use in Pennsylvania and a 50-ton locomotive crane. Inquiry for overhead traveling cranes is good, but purchasing in this field also has been light, although a number of small orders has been placed recently with but little competitive bidding.

Among recent purchases are:

Union Shipbuiding Co., Baltimore, two 10-ton, 60-ft. span overhead cranes from a Western builder.

General Electric Co., Schenectady, N. Y., two 10-ton, one 35-ft. and the other 55-ft span overhead cranes from an unnamed builder.

New York Central Railroad, 25-ton locomotive crane for use in Ohio from Ohio Locomotive Crane Co.

Jones & Laughlin Steel Corporation, Pittsburgh, two mill-type cranes from Cleveland Crane & Engineering Co., and two ladle cranes from Alliance Machine Co.

Wheeling Steel Corporation, Wheeling, W. Va., two ladle cranes from Alliance Machine Co.

American Oil Co., American Building, Baltimore, will soon begin work on oil storage and distributing plant at West Bridgewater, Pa., to cost about $40,000 with equipment. T. J. O'Connell is company engineer.

Philadelphia

PHILADELPHIA, Oct. 21.—Bids have been asked on general contract by Electric Service Supplies Co., Seventeenth and Cambria Streets, Philadelphia, manufacturer of electrical equipment, for addition to plant, to cost over $45,000 with equipment. Conrad Neff, Philadelphia, is architect.

Grinnell Co., Providence, R. I., manufacturer of fire extinguishers, piping systems, etc., will soon begin work on new factory branch and distributing plant at Philadelphia, to cost over $65,000 with equipment. Local headquarters are in Commercial Trust Building.

Sun Oil Co., 1608 Walnut Street, Philadelphia, is considering construction of four new units at refining, storage and distributing plant at Marcus Hook, Pa., to be used primarily for enlarged output of high-test gasoline, to cost over $1,000,000 with machinery.

Philadelphia & Reading Coal & Iron Co., Reading Terminal, Philadelphia, will soon begin work on second electrically-operated coal breaker at St. Nicholas, Pa., in connection with expansion and electrification of coal properties for which an appropriation of $19,000,000 has been arranged; new unit will supplement another centralized breaker now in course of construction at Locust Summit, Pa., scheduled for completion early in next year. Work will include electrification of all transportation facilities at mines, electric hoists and conveyors, ventilating fans and equipment, pumping and power machinery. Stone & Webster Engineering Corporation, 49 Federal Street, Boston, is engineer.

Atlantic Refining Co., 260 South Broad Street, Philadelphia, has acquired waterfront property at New Haven, Conn., and plans new oil refining, storage and distributing plant, with 500-ft. pier equipped with mechanical loading and handling facilities, to cost about $450,000 with equipment.

Keystone Aircraft Corporation, Bristol, Pa., a unit of Curtiss-Wright Corporation, Buffalo, is contemplating expansion, to include erection of several one-story units for commercial plane manufacture, including parts and assembling divisions. Parent company proposes to transfer a large volume of commercial aircraft manufacture to this point, including multi-passenger airplanes. Expansion will cost more than $250,000. C. L. Roloson is vice-president and works manager at Bristol.

Standard Oil Co. of Pennsylvania, Sixth and Chestnut Streets, Philadelphia, has awarded general contract to Charles Cump, Kenwood Avenue, Chambersburg, Pa., for oil storage and distributing plant at Chambersburg to cost about $50,000 with equipment.

Safe Harbor Water Power Corporation, recently organized as subsidiary of Pennsylvania Water & Power Co., Holtwood, Pa., with headquarters in Lexington Building, Baltimore, has plans for hydro-electric power project at Safe Harbor on Susquehanna River, about eight miles from plant at Holtwood, to cost about $30,000,000 with steel tower transmission system. J. E. Aldred is president.

American Manganese Fertilizer Co., 1030 Vermont Avenue, N. W., Washington, Frank R. Porter, secretary, recently formed with capital of $500,000, has acquired six-acre tract at Alexandria, Va., heretofore held by Virginia Shipbuilding Corporation, and is contemplating construction of plant for production of commercial fertilizers, to cost over $85,000 with machinery.

Pittsburgh

PITTSBURGH, Oct. 21.—Machine tool orders were only moderate the past week, but additional inquiry has appeared and the volume of pending business is as great as at any time during the year. Among the larger inquiries before the trade are those of the Westinghouse Electric & Mfg. Co. and the Norfolk & Western. The United States Aluminum Co., which recently placed a sizable list of tools for its New Kensington plant, has issued a smaller supplementary list. The Baltimore & Ohio is also inquiring for a few miscellaneous items but otherwise railroad inquiry is rather limited.

Inquiry for machinery and equipment for the Ambridge plant of the A. M. Byers Co. is expected within the next few weeks, although purchase will be delayed until late in the year. National Tube Co. will also be a large buyer toward the end of the year, although inquiry has not yet appeared for the machine tools required for its new McKeesport plant. Other large prospective equipment purchases are still dormant, but crane buying has been active and the placing of crane orders usually precedes machinery buying by only a few months.

Plans are being considered by United States Chain & Forging Co., Union Trust

Building, Pittsburgh, for addition to plant at McKees Rocks, to cost about $45,000 with equipment.

Mutual Telephone Co., 24 East Tenth Street, Erie, Pa., will take bids for a one and two-story equipment storage and distributing plant with electrical and mechanical repair departments, and automobile service and repair shop, to cost $175,000 with equipment. Myers & Johnson, Commerce Building, are architects.

Manion Steel Barrel Co., Rouseville, near Oil City, Pa., will begin superstructure for a one-story plant unit, 50 x 100 ft., to cost about $45,000 with equipment. General contract has been let to L. O. Bouquin, 13 East First Street, Oil City. D. S. Manion is president.

Board of Public Education, Bellefield Avenue and Forbes Street, Pittsburgh, H. W. Cramblet, secretary, is asking bids until Nov. 6, for equipment for Clifford B. Connelly Trade School.

Cohen Auto Parts Co., 150 East Ninth Street, Erie, Pa., has awarded a contract to George Hart, 1011 Twenty-ninth Street, for one-story plant, to cost $35,000 with equipment. Shutts & Morrison, Marine Bank Building, are architects.

United Zinc Smelting Corporation, 233 Broadway, New York, is said to be planning extensions and improvements in plant at Moundsville, W. Va., with installation of additional equipment, to cost $175,000.

New Kanawha Power Co., a subsidiary of Union Carbide & Carbon Corporation, 30 East Forty-second Street, New York, is considering hydroelectric power plant at Hawks Nest, near Gauley Junction, W. Va., on New River, to develop capacity of 100,000 hp., to cost more than $2,000,000 with transmission system. Company also plans another development on same river at Sandstone Falls, to cost about $750,000.

Barium Reduction Corporation, Charleston, W. Va., plans branch sodium sulphate plant at Horseshoe Lake, near Ormiston, Sask., to cost more than $400,000 with machinery, to be ready for service in six to eight months.

Buffalo

BUFFALO, Oct. 21.—American Roto-Floor Corporation, care of Rupert Swinnerton, Eleanor Apartments, Niagara Falls, N. Y., representative, manufacturer of steel rotating floors for commercial garages, etc., is contemplating new plant to cost more than $75,000 with equipment. Company has been carrying out production for some time at local works of Niagara Steel Finishing Co.

Brewer-Tichenor Corporation, Cortland, N. Y., manufacturer of automobile accessories and equipment, will build two new plant units, for which general contract has been let to Austin Co., Cleveland, consisting of one-story machine shop, 60 x 80 ft., and one-story forge shop, 75 x 100 ft.; a one-story extension to storage and distributing building will also be erected, 35 x 75 ft., entire project to cost more than $125,000 with equipment. Two traveling cranes of 5 and 12-ton capacities will be installed in addition to other equipment.

Hanau Engineering Co., Inc., Buffalo, has been organized to take over and expand local company of same name, with plant at 951 West Ferry Street, manufacturer of dental instruments and kindred precision equipment. Rudolph L. Hanau and J. L. Stern are heads.

Town of Amherst, Central School District No. 1, A. A. Cushing, 69 Chassin Avenue, Eggertsville, N. Y., in charge, is considering installation of manual training equipment in new high school at Amherst, for which bids have been asked on general contract, to cost $450,000. Paul H. Harbach and James W. Kideney, 271 Delaware Avenue, Buffalo, are architects.

George J. Egan, 414 Woodward Avenue, Buffalo, and Herbert H. Streng, 187 Crosby Street, Kenmore, N. Y., have organized Egan & Streng, with capital of 200 shares of stock, no par value, and will operate local plant for production of machinery and parts.

North East Appliance Corporation, Rochester, N. Y., has been organized by General Motors Corporation to take place of former North East Electric Co., recently purchased by General Motors Corporation. Directors of new corporation are Anthony H. Russo, Aloysius F. Powers, and Henry W. Hogan, all of 1775 Broadway, New York. Former North East Appliance, Inc., controlled by virtually same stockholders as was North East Electric Co., but which was not included in sale to General Motors, has been granted a certificate of change of name to Electromatic Typewriters.

Detroit

DETROIT, Oct. 21.—Contract has been let by Koestlin Tool & Die Co., 3601 Humboldt Avenue, Detroit, to Krieghoff Co., 6601 Humboldt Avenue, for one and two-story addition, 65 x 120 ft., to cost about $60,000 with equipment. Muller & Krecke, American Radiator Building, are architects.

United States Pressed Steel Co., Ypsilanti, Mich., has plans for one-story addition to manufacture new type of universal drive shaft for passenger automobiles, to cost about $75,000 with equipment.

Ex-Cell-O Aircraft & Tool Corporation, 1200 Oakman Avenue, Detroit, has arranged for an increase in capital, part of proceeds to be used for expansion. Company is completing an addition aggregating 62,000 sq. ft., floor space, for manufacture of new precision parts for aircraft engines, to cost about $100,000 with equipment.

Consumers Power Co., Jackson, has plans for extensions in plant at Zilwaukee, Mich., to include construction of dock for coal unloading, storage facilities for handling about 250,000 tons of coal at one time, hoisting, conveying and other coal-handling equipment, etc., to cost about $500,000.

Defoe Boat & Motor Works, Inc., Bay City, has approved expansion program at boat building plant, to cost over $75,000 with equipment.

Terrell's Equipment Co., Hall Street, Grand Rapids, manufacturer of steel equipment for factory service, lockers, etc., has awarded a general contract to John McNabb & Sons, Murray Building, for two-story top addition, 100 x 350 ft., to cost about $80,000 with equipment.

Motor Wheel Corporation, Saginaw Street, Lansing, in addition to four-story extension to wire wheel manufacturing plant, to cost about $200,000, is considering two-story addition at plant of Prudden wheel division, 80 x 475 ft., for storage and distribution, to cost $120,000 with equipment.

American Twist Drill & Tool Co., 2804 West Jefferson Avenue, Detroit, has plans for a one-story addition, 175 x 200 ft., to cost about $135,000 with equipment. C. W. Ditchy, 415 Brainard Street, is architect.

In connection with expansion program to cost about $100,000 recently authorized by Electric Auto-Lite Co., Toledo, Ohio, manufacturer of automobile starting and lighting equipment, plans are under way for extensions and improvements in plant of American Enameled Wire Co., Muskegon, with installation of equipment.

Olds Motor Works, Inc., Lansing, a subsidiary of General Motors Corporation, has plans for a new two-story unit, 75 x 141 ft., for automobile engine service for Oldsmobile Six, and for a two-story engineering laboratory, 60 x 90 ft. Work is under way on an addition to sheet metal department and an extension for parts and service divisions. Entire expansion will cost more than $1,000,000.

Panyard Piston Ring Co., Muskegon, Mich., has been incorporated with capital of $60,000 to manufacture piston rings and has purchased at receiver's sale plant of Panyard Machine & Mfg. Co. Company is in market for castings and spring steel. Philip P. Schnorbach is president and D. Briggs vice-president and general manager.

Hastings Mfg. Co., Hastings, Mich., has been organized to make automobile piston rings and is building plant, 64 x 321 ft., containing 20,000 sq. ft. manufacturing space. It is in market for equipment. C. W. Dolan is secretary.

Cleveland

CLEVELAND, Oct. 21.—Machine tool sales picked up considerably the past week following quite an extended dull period. There is also a marked increase in inquiry. Demand is well distributed through various industries and is mostly for single machines. The automotive industry, however, continues an unimportant factor in the market. The National Cash Register Co. and the Frigidaire Corporation, Dayton, Ohio, are each credited with the purchase of several lathes. Recent purchases by the Amtorg Trading Corporation for Russian tractor plants are understood to include a round lot of presses placed with an Ohio manufacturer.

Youngstown Pressed Steel Co., Warren, Ohio, subsidiary of Sharon Steel Hoop Co., Sharon, Pa., has plans for several new units, to cost $400,000 with equipment. Work will include one-story enameling works, scheduled for completion early next year.

Screw & Fastener Supply Co., 3913 Mayfield Road, Cleveland, has awarded general contract to G. W. Pelton, 19760 Lakeshore Boulevard, for one-story addition, to cost $55,000 with equipment. E. F. Devine is one of heads of company in charge.

Firestone Tire & Rubber Co., Akron, Ohio, is disposing of a preferred stock issue of $60,000,000, part of fund to be used for expansion, including developments in foreign countries. Company will soon begin superstructure for seven-story addition to Akron mill, 110 x 180 ft., to cost about $1,000,000 with machinery, and will also build branches and service units in different cities.

E. T. Pierce Co., 4903 Harlem Avenue, Cleveland, manufacturer of tools, dies, etc., will build one-story plant, 65 x 100 ft., to cost about $45,000 with equipment. G. A. Ebeling, 737 Prospect Avenue, is architect.

Mid-West Forge Co., 17301 St. Clair Avenue, Cleveland, is considering one-story addition to cost about $40,000 with equipment. R. I. Gale is president.

Ohio Injector Co., main plant and office at Wadsworth, Ohio, has started construction on a four-story addition, 280 x 340 ft. Building will be used for manufacture of brass and iron valves and is expected to be ready for operation shortly after first of year.

Werner G. Smith Co., Cleveland, manufacturer of oils for foundry trade, has been amalgamated with Archer-Daniels-Midland Linseed Co., Minneapolis, Minn., latter company having acquired a substantial interest in Smith company. No change will be made in corporate name of Werner G. Smith Co.

Chicago

CHICAGO, Oct. 21.—Machine tool dealers in this district are still busy following leads developed at the recent Cleveland show. Sales are not impressive in the absence of large lists. Scattered purchases of individual tools, many of which are of small size, are fairly numerous and inquiry of this character is more brisk than a week ago. Western Electric Co. continues to contract for large quantities of machine work and jobbing shops are profiting by this situation. A Chicago district steel mill is in the market for six tools for its maintenance department.

Used tools remain in good demand. The International Harvester Co. will buy several more for its Weber works, Chicago, and dealers from California are seeking supplies in this market.

Hafner Mfg. Co., 1010 North Kolmar Avenue, Chicago, toy manufacturer, will build a new factory, 100 x 270 ft., to cost $60,000. T. B. Jorgenson, 510 North Dearborn Street, is architect.

Johnson Motor Co., Waukegan, Ill., manufacturer of outboard motors, has started erection of an addition which, with equipment, will cost over $100,000.

McIlvaine Burner Corporation, Evanston, Ill., manufacturer of oil burners, contemplates building a new assembly plant.

Edgar T. Ward & Son, 1455 West Thirty-seventh Street, Chicago, iron and steel, will soon take bids for a one and two-story addition to storage and distributing plant, to cost over $100,000 with equipment. A. Epstein, 2001 West Pershing Road, is architect and engineer.

Grigsby-Grunow Co., 2038 North Kolmar Avenue, Chicago, manufacturer of radio equipment and sets, has purchased plant of General Motors Corporation on Dickens Avenue, consisting of building with 650,000 sq. ft. floor space and adjoining land which will be used for early erection of a multi-story addition to approximate 350,000 sq. ft. floor area. Company also plans three-story addition to plant on Armitage Avenue. Entire expansion will cost over $1,000,000 with equipment.

City Council, Ottumwa, Iowa, has plans for a municipal hydroelectric generating plant to cost about $750,000 with transmission lines, and will soon ask bids on general contract. Brown & Cook, 106 North Market Street, are engineers. Charles Wyman, City Hall, is city engineer.

Allis-Chalmers Mfg. Co., West Allis, Wis., has plans for an addition to tractor plant at Springfield, Ill., to cost more than $400,000 with equipment. Company will carry out an expansion at West Allis works, including construction of one-story forge shop and new unit for manufacture of motors, to cost about $1,500,000 with machinery.

Minneapolis Gas Light Co., 16 South Seventh Street, Minneapolis, Minn., will soon take bids for three-story equipment storage and distributing plant, with mechanical and repair divisions, to cost $180,000 with equipment. Ekman, Holm & Co., Phoenix Building, are architects. John K. Swanson, vice-president and general manager, in charge.

Brasco Mfg. Co., 5035 South Wabash Avenue, Chicago, manufacturer of metal store fronts, has acquired factory of Morgan-Gardner Electric Co., Halsted and 152nd Streets, Harvey, Ill., totaling about 50,000 sq. ft. floor space, and will use for new plant. Company is said to have plans for a one-story addition on adjoining site, to cost about $100,000 with equipment, for which bids will be asked on general contract early in November.

Temple, Inc., 1925 South Western Avenue, Chicago, manufacturer of radio equipment and devices, is considering construction of new plant unit, to cost over $125,000 with machinery.

Apex Regulator Co., 508 South Third Avenue, Marshalltown, Iowa, has been organized to manufacture pressure reducing and regulating valves, expansion valves and relief valves. Plant is in production.

National Stoker Co., 2020 Nicollet Avenue, Minneapolis, has been incorporated and is manufacturing automatic ram-type coal stokers specially adapted for burning wet screenings. Part of machine work and all of assembly work is done in company's plant. Purchase of additional equipment is contemplated. C. E. Betcher is secretary and treasurer.

Paf Mfg. Co., Greenville, Ill., manufacturer of spark plugs, is erecting a new factory at a cost of $30,000.

Milwaukee

MILWAUKEE, Oct. 21.—Machine tool bookings are running considerably ahead of those during the first three weeks of September, and October business is expected to compare favorably with that of any summer month. Many orders were taken during the Cleveland show and a large part of the pending inquiries were closed shortly after. Although the volume of automobile production is low for the season, manufacturers continue to buy some equipment.

Milwaukee Electric Railway & Light Co., 217 Michigan Street, has plans for 60,000 to 75,000-kw. steam generating plant to be constructed at Port Washington, Wis., with ultimate investment of $25,000,000. Negotiations are under way for purchase of municipal light and power plant at Port Washington.

Wrought Washer Mfg. Co., 46-54 South Bay Street, Milwaukee, has purchased property at Oklahoma and First Avenues, including 16 acres and building with 150,000 sq. ft. floor space, and will equip for own use or that of a subsidiary.

Snap-On Wrench Co., 1270 South Pierce Street, Milwaukee, will move to Kenosha where a building costing $150,000 will be completed in January, and $215,000 worth of new equipment will be installed. William Seideman is secretary, and Frank D. Chase, Inc., 720 North Michigan Avenue, Chicago, is general contractor.

Utility Mfg. Co., Portage, Wis., recently organized to manufacture ice cream freezers, metal household appliances and novelties, is building a two-story factory, 80 x 80 ft.

Board of Education, West Allis, Wis., has closed bids for construction of third unit, three stories, 40 x 57 ft., to West Allis Vocational School.

Barkhausen Oil Co., 815 South Monroe Street, Green Bay, Wis., is planning to rebuild oil refining and storage plant, damaged by recent fire.

Gulf States

BIRMINGHAM, Oct. 21. — Bids have been asked by Universal Metal Mfg. Co., Tarrant, Ala., for one-story addition, 75 x 125 ft., to cost about $28,000 with equipment. Charles H. McCauley, Jackson Building, Birmingham, is architect.

Montgomery Elevator Co., Moline Ill., manufacturer of elevators, parts, etc., has purchased property at Houston, Tex., for a new branch assembling plant, to cost about $25,000 with equipment.

Central Power & Light Co., San Antonio, Tex., has secured permission to use water from Devil's River, near Del Rio, Val Verde County, for a hydroelectric generating plant, on which work will start before close of year. Initial unit will have capacity of 45,000 kw., and will cost about $1,000,000 with transmission system.

Republic Portland Cement Co., San Antonio, Tex., is disposing of a bond issue of $1,250,000, part of fund to be used for new cement mill now being completed about 10 miles from city. Plant will have an initial output of about 100,000 bbl. per month. Terrell Bartlett Engineers, Inc., San Antonia, and Richard K. Meade & Co., 10 West Chase Street, Baltimore, are engineers.

Planters' Package Co., Crystal Springs, Miss., an interest of Hazlehurst Box Co., Hazlehurst, Miss., has authorized rebuilding of fruit and vegetable package plant recently destroyed by fire. Several new units will be built, including veneer mill, box factory, machine shop, power plant and wood-working mill. Alexander Wilson is company engineer in charge.

Officials of Engineers Public Service Co., 120 Broadway, New York, operating Baton Rouge Electric Co., Baton Rouge, La., and other electric light and power utilities, are organizing Louisiana Steam Products Co., to construct a new steam-operated generating plant adjoining refinery of Standard Oil Co. of Louisiana at Baton Rouge, utilizing residue petroleum and gases, and natural gas for fuel. Plant will have a capacity of 45,000 kw., and will cost more than $800,000 with equipment. It will furnish service to Standard Oil Co. refinery where expansion costing close to $7,000,000 is under way. C. M. Smith will be president of Louisiana Steam Products Co., which will be under executive management of Stone & Webster, Inc., 49 Federal Street, Boston, engineer.

National Portland Cement Co., Vicksburg, Miss., has plans for new mill at Fort Hill, where property has been acquired, including machine shop, power house and other buildings, to cost $1,000,000 with equipment. Work will begin in about 60 days.

Gruver Roller Bearing Co., Gruver, Tex., will erect new one-story plant 50

x 100 ft., for manufacture of roller bearings and kindred equipment, to cost $25,000 with equipment.

Texas Quarries, Inc., Austin, Tex., recently organized, will be an independent company and will not be affiliated with Indiana Limestone Co., Bedford, Ind., previously reported. Company has tract of about 4000 acres near city, and will soon begin construction of quarry plant and finishing mill to cost about $240,000 with machinery.

Gulf Pipe Line Co., a subsidiary of Gulf Oil Corporation, Frick Annex, Pittsburgh, with main refinery at Port Arthur, Tex., has purchased a 200-acre tract near Lucas, Tex., for extensions in storage and distributing plant, including steel storage tanks, pipe lines, pumping and power equipment, to cost more than $125,000.

East Coast Refrigeration Co., Lake Worth, Fla., has plans for a two-story cold storage and refrigerating plant, 65 x 125 ft., to cost about $85,000 with machinery. Daniel C. Smith is secretary.

D. S. Mair Machinery Corporation, Houston and Dallas, Tex., has been formed by D. S. Mair and Charles J. Harter to succeed D. S. Mair Machinery Co. Mr. Harter has been railroad representative in Texas for Joseph T. Ryerson & Son, Inc., and new organization will represent Ryerson company in machinery sales only for industrial and railroad uses in Texas, Louisiana and southern Arkansas. It will also represent in same territory, Whiting Corporation, Harvey, Ill., and Landis Machine Co., Waynesboro, Pa. Mr. Harter will be in charge of Dallas office, 4521 Edmondson Avenue.

Cincinnati

CINCINNATI, Oct. 21.—Although the volume of machine tool business so far this month indicates a slight recession from the level of the first half of September, fresh bookings by manufacturers the past week were larger than in the first week of October. While demand for planers and heavier tools was sustained, improvement in the call for lathes contributed to the increase.

An automobile manufacturer placed an order with a local builder for four large high-production lathes. A Pittsburgh company bought one 32-in. lathe from a local manufacturer.

Commerce Garage, 321 Race Street, Cincinnati, has awarded general contract to Hillsmith & Co., Chamber of Commerce Building, for seven-story and basement service, repair and garage building, to cost about $180,000 with equipment.

Columbus Auto Brass Co., 767 North Fourth Street, Columbus, Ohio, has awarded a general contract to F. & Y. Construction Co., 731 East Broad Street, for two-story addition, to cost about $25,000 with equipment.

Allen Mfg. Co., Tenth Avenue, North, Nashville, Tenn., manufacturer of stoves, ranges, etc., will take bids at once for one-story plant at Franklin, Tenn., with about 150,000 sq. ft. floor space, to cost $200,000 with equipment. Robert & Co., Bona Allen Building, Atlanta, Ga., are architects and engineers.

Second National Garage, Inc., American Trust Building, Nashville, Tenn., has asked bids on general contract for a multi-story garage, repair and service building, to cost about $500,000 with equipment. Hart, Freeland & Roberts, Independent Building, are architects. R. R. Ogilvie is head.

Reynolds Metals Co., Thirtieth and Grand Streets, Louisville, has arranged for increase in capital from 525,000 to 1,000,000 shares of stock, part of fund to be used for expansion. Plans have been completed for new plant near city, to cost over $100,000 with equipment. Arthur Tafel, 140 South Third Street, is architect.

Holophane Co., Newark, Ohio, manufacturer of lighting equipment, reflectors, etc., has plans for two-story addition for storage and distribution, to cost about $45,000 with equipment. Headquarters are at 342 Madison Avenue, New York.

Hauser-Stander Tank Co., Cincinnati, has received bids for new plant on an 11-acre tract in Pleasant Ridge, a suburb. Present plant on Spring Grove Avenue will be razed to make way for overhead right of way for Baltimore & Ohio Railroad.

St. Louis

ST. LOUIS, Oct. 21.—St. Louis Spring Co., 3135 Washington Street, St. Louis, manufacturer of steel springs, has leased for expansion, one-story addition to be built on adjoining site, 75 x 130 ft., to cost $40,000 with equipment. Benjamin Shapiro, Syndicate Trust Building, is architect.

Red Wing Commercial Aircraft Co., St. Joseph, Mo., has plans for new one-story plant for parts production and assembling, to cost about $55,000 with equipment.

City Council, Campbell, Mo., has plans for municipal electric light and power plant, with Diesel engine prime mover, to cost more than $85,000 with machinery. Russell & Axon, 6200 Easton Avenue, St. Louis, are engineers.

Board of Education, St. Joseph, Mo., plans installation of manual training equipment in new central high school, to cost $750,000, for which plans will be drawn by Eckel & Aldrich, Corby Building, architects; William B. Ittner, Board of Education Building, St. Louis, is associate architect.

Chicago, Rock Island & Pacific Railroad, La Salle Street Station, Chicago, W. H. Peterson, chief engineer, will soon begin construction of one-story car repair shop at Kansas City, Kan., 70 x 300 ft., to cost over $75,000 with equipment.

Century Engine Works, Inc., 3813 Independence Avenue, Kansas City, Mo., manufacturer of engines for industrial, marine and other service, is planning installation of lathes, milling machine and other tools. C. V. Fitzpatrick is vice-president, in charge.

Shell Petroleum Corporation, Shell Building, St. Louis, has plans for a new oil storage and distributing plant at Toledo, Ohio, with dock to accommodate tank steamers, to cost over $2,000,000 with mechanical-handling and other equipment.

Glenn-Smith Fuel Co., Omaha, Neb., manufacturer of fuel briquettes, is planning to rebuild part of plant destroyed by fire Oct. 7.

Topeka Airport & Aviation Co., 1345 Fillmore Street, Topeka, Kan., has plans for steel hangar with repair facilities, to cost about $35,000 with equipment.

Dodge City Terminal Elevator Co., Dodge City, Kan., will soon begin construction of grain elevator with capacity of 500,000 bu., including conveying, elevating, screening and other equipment, to cost over $100,000. Structure will be operated under lease by C. C. Isley Lumber & Grain Co., Dodge City.

St. Joseph Railway, Light, Heat & Power Co., St. Joseph, Mo., is concluding purchase of municipal electric light and power plant at Oregon, Mo., and will operate in conjunction with properties. Extensions and improvements are planned, including transmission lines.

Tiffany Aluminum Products Co., 1319 Locust Street, St. Louis, has purchased a building at Branch and Buchanan Streets, containing 17,000 sq. ft. and will remove to new location shortly after Nov. 1. About $20,000 is being spent on improvements and additional equipment.

City Council, Junction City, Kan., is planning construction of municipal electric light and power plant, to cost $425,000 with equipment. A special election has been called Oct. 22 to vote bond issue in amount noted. Charles A. Haskins, Finance Building, Kansas City, Mo., is consulting engineer.

Indiana

INDIANAPOLIS, Oct. 21.—Supplementing contract recently let for two-story mill to cost about $200,000 with equipment, United States Corrugated Fibre Box Co., 1315 Martindale Avenue, Indianapolis, has awarded contract for second unit to Hall Construction Co., Board of Trade Building, for storage and distribution, one story, 105 x 160 ft., to cost $65,000 with equipment. Charles E. Bacon, Odd Fellow Building, is architect.

Municipal Airport Commission, A. B. Ayres, chairman, Newcastle, is planning establishment of airport with hangars, repair shop and other units, to cost about $100,000 with equipment.

Dixie Sales Co., Odd Fellow Building, Indianapolis, manufacturer of special fuel, formed as a by-product of turpentine kilns, with resin, etc., is planning enlargements in plant at Douglas, Ga., to cost more than $60,000. O. C. Brown is general manager.

Dudlo Mfg. Co., Wall Street, Fort Wayne, manufacturer of electric wire, coils, etc., has awarded general contract to Indiana Engineering & Construction Co., Central Building, for addition, 65 x 75 ft., to cost about $50,000 with equipment.

General Electric Co., 1635 Broadway, Fort Wayne, headquarters at Schenectady, N. Y., has awarded general contract to Indiana Engineering & Construction Co., Central Building, for one-story addition, 50 x 70 ft., to cost about $35,000 with equipment.

Westinghouse Electric & Mfg. Co., East Pittsburgh, and 814 North Senate Street, Indianapolis, has plans for a one-story factory branch, storage and distributing plant, 80 x 90 ft., to cost about $60,000 with equipment. Charles H. Byfield, Peoples' Bank Building, is architect.

Hydroil Corporation, Lebanon, has been reorganized with capital of $250,000 to manufacture oil conditioning equipment for use by public utility companies, shipbuilding companies and industrial plants.

H. O. W. Machining Co., Fort Wayne, has been incorporated and is operating a plant at 843 Walnut Street, doing general machine production work.

Joslyn Mfg. & Supply Co., Fort Wayne, manufacturer of small steel bars, bands and shapes, will soon begin erection of an addition, 80 x 230 ft., to cost about $100,000.

New England

BOSTON, Oct. 21.—An order for 30 Pratt & Whitney 5-in. milling machines has been booked by Botwinik Brothers, Inc., for spot delivery to Middle West.

Kerite Insulated Wire & Cable Co., Seymour, Conn., has awarded general contract to H. Wales Lines Co., Meriden, Conn., for one-story and basement addition, 30 x 45 ft., to cost about $25,000 with equipment. Headquarters are at 30 Church Street, New York.

Plans are under way by Bourden Aircraft Co., Hillsgrove, R. I., for merger with Viking Flying Boat Co., New Haven, Conn., under last noted name. Consolidated organization will concentrate production at New Haven plant, which will be expanded for manufacture of Kitty Hawk aircraft, as produced by Bourden company. Robert E. Gross is president of new organization, and Reginald D. Thomas, vice-president and general manager.

C. I. Brink, Inc., 24 Gold Street, South Boston, manufacturer of electric signs and displays, has awarded general contract to William T. Reed Co., 89 Broad Street, for one-story addition, to cost about $25,000 with equipment.

Warren Foundry & Pipe Co., 201 Devonshire Street, Boston, headquarters at 11 Broadway, New York, has asked bids on general contract for one and two-story plant at Everett, Mass., to cost more than $50,000 with equipment. French & Hubbard, 210 South Street, Boston, are architects and engineers.

Superior Spring & Mfg. Co., 373 Washington Street, Hartford, Conn., has filed plans for two-story unit, 55 x 130 ft., to cost about $50,000 with equipment. K. Schulz, Sr., 118 Sheffield Avenue, is architect.

Rubel Ice Co., 200 Geneva Avenue, Boston, has plans for a new ice-manufacturing plant, to cost about $100,000 with machinery. Headquarters are at 937 Fulton Street, Brooklyn, N. Y.

DuPont Viscoloid Co., Leominster, Mass., will soon break ground for addition to manufacture new type of safety glass for automobiles, to cost $1,000,000 with machinery. Company is a subsidiary of E. I. duPont de Nemours & Co., Wilmington, Del.

Merger is being arranged between Thomson Electric Welding Co., Lynn, Mass., and Gibb Welding Machines Co., Bay City, Mich., both manufacturers of electric welding equipment. Thomson-Gibbs Electric Welding Co., will be formed to operate consolidated organization, and expansion will be carried out. It is purposed to continue production at both plants.

Possner Fire Alarm Corporation, 55 Rice Street, Providence, R. I., has been formed to manufacture automatic fire detecting systems for installation in residences and industrial buildings. Factory is now being equipped. A. W. Possner is president.

Pacific Coast

SAN FRANCISCO, Oct. 17. — Oliver United Filters Co., Fourth and Madison Streets, Oakland, Cal., manufacturer of mechanical filtering equipment, has engaged Reed & Corlett, Oakland Bank of Savings Building, architects, to prepare plans for a new plant group at Fruitvale, reported to cost about $500,000 with equipment.

Western Light & Fixture Co., Los Angeles, has awarded a general contract to William P. Neil Co., Inc., 4818 Lomita Vista Avenue, for one-story plant, 160 x 198 ft., to be used in part for storage and distribution, to cost $45,000. Lawrence Nowell, 4814 Lomita Vista Avenue, is engineer.

General Motors Corporation, General Motors Building, Detroit, is considering purchase of more than 150 acres near Los Angeles, as site for new automobile assembling works for one of its units, to cost more than $2,000,000 with equipment.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has awarded a general contract to Monson Brothers, 475 Sixth Street, for group of one-story equipment storage and distributing units, with mechanical and electrical repair departments, to cost over $200,000 with equipment.

R. F. Fleming Co., 68 North Eleventh Street, Portland, has leased a one-story building, 100 x 100 ft., to be erected at Eleventh and Everett Streets, for a new mechanical equipment and repair shop, to cost $30,000. Claussen & Claussen, Buyers Building, are architects.

Inland Power & Light Co., Public Service Building, Portland, has secured permission for a hydroelectric power project on Lewis River, near Columbia National Forest, Wash., with initial capacity of 54,000 hp., and ultimate output of 216,000 hp., to cost over $6,000,000 with transmission system.

Vancouver Cross Arms Co., Vancouver, Wash., recently organized to manufacture pole equipment for electric, telephone and other service, is planning erection of one-story factory, 70 x 560 ft., to cost about $100,000 with equipment. A traveling crane will be installed.

Board of Works, Tacoma, Wash., has awarded contract to Walesby Construction Co., Puget Sound Bank Building, for one-story municipal machine and repair shop, to cost about $25,000 with equipment.

Canada

TORONTO, Oct. 21.—Increased volume in machine tool sales was noted the past week, partly due to the closing of several small lists. Much of the demand is for replacement and consists of one or two tools to a customer. Small tools are moving freely.

It is stated that Waterloo Mfg. Co., Waterloo, Ont., and an agricultural implement company of Melbourne, Australia, are interested in a company to be formed to locate a plant at Waterloo for manufacture of a new combine thresher.

Bids will be received by Mayor S. McBride, chairman of the Board of Control, Toronto, until Nov. 5, for the supply and installation of a 10,000,000-gal. centrifugal pump and motor, for Riverdale pumping station.

Kroehler Mfg. Co., Stratford, Ont., has awarded a number of contracts for erection of a plant at Montreal, to cost $50,000.

Canadian Liquidair Co., Montreal, will erect a plant at Regina, Sask., to cost $40,000, for which bids will be called immediately.

Malcolm & Hill, Ltd., Kitchener, Ont., manufacturer of furniture, etc., will erect a factory at Regina, Sask., to cost $250,000. Construction will start early next year.

Foreign

PROPERTY at Cologne, Germany, has been acquired by Ford Motor Co., Detroit for new assembling plant to cost more than $750,000 with equipment.

Southern Railway Co., London, England, has authorized electrification of main line from London to Brighton, including branches to Worthing and Hove, about 48 miles in all, using third rail system, to cost over $2,500,000 with equipment and rolling stock.

Magnavox Co., Oakland, Cal., manufacturer of radio equipment, has plans for organization of a subsidiary to establish a plant near London, England, initial works to represent investment of more than $200,000.

Patino Mines & Enterprises Consolidated, 20 Pine Street, New York, has purchased tin smelting plant of Williams, Harvey & Co., Ltd., Bottle, Liverpool, England, and will operate in conjunction with other plants. New owner is considering improvements in property, and installation of additional equipment.

Charles F. Kamrath, 222 West Adams Street, Chicago, of Bloom & Kamrath, same address, refrigerating and packing-house engineers, has been engaged by Soviet Russian Government through Amtorg Trading Corporation, 261 Fifth Avenue, New York, to prepare plans for a modern meat-packing plant at Moscow, to be first of seven such units in European Russia and Siberia, under a five-year modernization program, to cost about $50,000,000, including mechanical-handling equipment, power and refrigerating machinery, etc., larger part of which is expected to be of American manufacture. Frank W. Marlow, formerly in engineering department of Armour & Co., Chicago, will be associated with engineers in work.

New Trade Publications

Tool Steels.—A. Milne & Co., 741 Washington Street, New York. Booklet divided into 12 sections devoted to tool steels, hollow tool steels, drill steels, Wardlow's products, anvils, Swedish Lancashire iron, Swedish electrical iron, Reynolds' aircraft tubing, tool hammers and picks, ball bearing steels, specialties, specifications and tables.

Flow-Meters.—Brown Instrument Co., Philadelphia. Bulletin of 32 pages, illustrated, showing the application of steam flow-meters in making economies in a steam plant operation estimated to cost $2,000,000,000 a year in the United States.

Oil-Burner Boilers.—Johnston Brothers, Ferrysburg, Mich. Catalog No. 29 of 12 pages illustrates and describes a steel boiler built in three sizes for residential use, to heat with oil as fuel. Features indicated are vertical, straight-line circulation and long gas travel, compared with conditions found in the usual domestic heating boiler.

Conveyor Equipment.—Saginaw Stamping & Tool Co., Saginaw, Mich. Catalog 29-CE of 42 pages illustrates and describes, with price list, the component parts of overhead conveyors for use in manufacturing plants and other places. Illustrations of installations are mainly, though not wholly, automotive. Trolley wheels are shown with both ball and roller bearings.

Gear-Grinding Chuck.—City Machine & Tool Works, Dayton, Ohio. Folder

of four pages illustrating and describing the Bolender gear-grinding chuck, in which the gears are so held while grinding that the bore is definitely concentric with the pitch line of the teeth.

Motor-Generator Sets.—Roth Brothers & Co., Chicago. A four-page bulletin, No. 20-301, sets forth information about Roth motor-generator sets.

Ingot Iron in the Oil Industry.—American Rolling Mill Co., Middletown, Ohio. "How Armco Ingot Iron Saves in the Oil Industry" is the title of a handsomely illustrated 32-page booklet which describes the advantages to be gained by using Armco ingot iron in the construction of equipment for refining, producing and marketing oil.

Mechanical Drive Turbines.—General Electric Co., Schenectady, N. Y. Bulletins 957-A and 197-B of four pages each illustrate two types of mechanical drive turbines. The first includes units up to 600 hp. and up to 6000 r.p.m., while the other includes units up to 500 hp. of 1200 to 4000 r.p.m. Both types may be had either condensing or non-condensing.

Improved Stable-Arc Welders.—Lincoln Electric Co., Cleveland. Four-page folder describing four improved models with separately-excited generator field and reactor in the arc circuit.

Floor Plate.—Alan Wood Steel Co., Conshohocken, Pa. Illustrated, eight-page pamphlet on "A W" Diamondette floor plates for use on car platforms, motor bus running boards and other applications where a light-section material will serve. For general structural purposes, where the plate itself must sustain the load, the company recommends the use of standard "A W" diamond pattern rolled steel floor plates.

Alloy Iron Castings.—Duriron Co., Inc., Dayton, Ohio. Bulletin No. 157 of four pages, illustrated, is entitled "Duriron Kettles and Tanks." It describes some special products which are used in the chemical industry as made by this company's special high-silicon alloy. A discussion of their design is particularly emphasized.

Alloy Iron Castings.—International Nickel Co., New York. A four-page leaflet entitled "Quality Castings," illustrated, discusses the use of "F" nickel in the manufacture of various types of castings. Under eight different sections some of the many uses and products, as well as important users, are outlined.

Electric Furnaces.—General Electric Co., Schenectady, N. Y. An illustrated booklet of 20 pages, attractively presented, discusses the general subject of "Electric Furnaces for Industrial Use," using at the same time the slogan, "Ultimately—Electric Heat in Every Industry." About 32 applications of various forms of furnaces for electric heating are illustrated and briefly discussed.

Lubricating Systems.—Keystone Lubricating Co., Twenty-first and Clearfield Streets, Philadelphia. Illustrated folder of 12 pages devoted to the pneuma-lectric lubricating system, which is said to give automatic attention to machinery of all descriptions. It is controlled by clock movement determining the frequency of application of lubrication.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

ALL naval powers have accepted the invitation to meet in London and consider limitation. The Japanese Naval Minister said that the real purpose of the meeting is to effect "positive reduction of armaments to a condition in which no nation could attack another."

* * * * *

MARKETS are spotty. The pace of business remains high as measured by 1928, but slow as measured by the spring of 1929 . . . Wheat prices are 5 to 6c. lower as the visible supply increases; export trade is rather slow and the milling rate is smaller than the 5-year average . . . Hardware is in good demand and prospects are good for the remainder of the year . . . Stocks and securities declined sharply, despite many evidences of easy money and a statement by C. E. Mitchell, president, National City Bank, that he sees no reason for an end-of-the-year slump in business expected by many . . . Retail trade is generally satisfactory except in the North Central States.

* * * * *

EMPLOYMENT in manufacturing industries during September was 4.5 per cent higher than a year ago, and payrolls 7.5 per cent greater. All industries shared in the advance except ceramics, tobacco and vehicles . . . Federal Reserve Board predicts that the agricultural income will be at least as large as 1928, and finds no evidence of curtailed purchasing power in farm centers.

* * * * *

ELECTRICAL industries are especially active, the employment index now being 127.3 as compared with 98.0 a year ago . . . General Electric Company's orders are 29 per cent greater than in the third quarter of 1928 . . . Coincident with "Light's Golden Jubilee" many large projects are announced, such as a 230,000-hp. hydroelectric plant on the Susquehanna, a 375,000-hp. steam-electric plant near Milwaukee, a $6,000,000 plant at Baton Rouge using oil refinery residues for fuel, and an $80,000,000 extension of underground power circuits in New York.

* * * * *

TELEPHONE profits for the third quarter are $40,600,000, so much larger than last year that a reduction in toll charges is in prospect . . . Profits of Western Union are about the same as last year . . . International Combustion Engineering Corporation (manufacturer of power plant equipment) and United Cigar Stores Company both passed their usual dividend . . . Chrysler Corporation earned $1.49 per share the last quarter, as compared to $2.29 in 1928. Slow delivery of bodies for new models is blamed for decreased sales.

* * * * *

COTTON prices are sagging . . . Government estimates place the total crop at 14,915,000 bales, than which only two were higher in the last 10 years. Texas alone has a disappointing yield . . . Cotton cooperatives have received the lion's share of the $57,000,000 in loans so far approved by the Federal Farm Board, but of this total only $700,000 has actually been called for . . . Alexander Legge, chairman Federal Farm Board, said that while all its activities have so far been designed to strengthen the cooperatives, in an emergency the Board would be justified in purchasing and storing a portion of a crop to maintain a reasonable price.

* * * * *

TEXTILES are in generally satisfactory condition. Philadelphia plants are especially busy. Finished cotton goods are active. Prices of woolen fabrics for women's spring wear, announced by American Woolen Company, are from 3 to 10c. a yard lower than quoted last fall.

* * * * *

PENSIONS and group life insurance are both provided in a new plan arranged for employees of the Southern Railway System . . . About 20,000 establishments now have group insurance for employees, and annual benefits total $80,000,000 . . . A uniform and model old-age pension law, providing for at least $300 per year for persons over 65, will be vigorously promoted in all States by the American Federation of Labor. . . . Lieutenant Governor Lehman of New York said that State assistance to aged citizens is no more revolutionary a project than the construction of an orphan asylum.

* * * * *

FREIGHT car loadings decline a little in all classifications except grain and live stock . . . The Interstate Commerce Commission, acting on its so-called O'Fallon decision, finds that the cost of reproducing the New York Interconnecting railroad would be $24,500,000, instead of $27,700,000, the company's book value . . . Baltimore has leased to Western Maryland Railway the $8,500,000 freight terminal constructed in accordance with comprehensive plans for improving the harbor, costing $50,000,000.

THE IRON AGE

New York, October 31, 1929

ESTABLISHED 1855 VOL. 124, No. 18

Output Regulated by Simple Plan

Inexpensive Method of Controlling Flow of Materials in a Forging Plant Reduces Production Costs

MORE than 95 per cent of the manufacturing establishments in the United States employ less than 250 men, in numerous cases as few as from 25 to 50. Many of them produce a variety of articles and consequently their problems of production and stock control are similar in various respects to those of larger plants. This article, setting forth the plan successfully used by a company employing about 25 men and turning out over 500 different products, should be of special interest to the small manufacturer.

FOR the relatively small company making a multitude of parts, close control of production to keep stocks within normal bounds is just as important as for the large company. When the number of parts is several hundred, the matter of controlling stocks becomes acute and calls for rigid supervision. To solve this problem in a simple yet effective way has been the achievement of the Kilborn & Bishop Co., New Haven, Conn., manufacturer of drop forgings.

Making close to 500 different parts, the company has found it advantageous from the standpoint of costs to eliminate, so far as possible, the keeping of elaborate records. Cluttering of the office files with innumerable cards and record sheets serves no good purpose. It occupies the undivided time of one or more clerks and in many cases means duplication of effort without tangible benefits.

After experimenting over an extended period with the trial and error method, the Kilborn & Bishop Co. has devised a system which is simple but adequate, inexpensive but profitable. It centers about what is termed a "supply and demand sheet," which is equivalent to a perpetual inventory of material in the plant. A separate sheet is used for each individual article made by the company. In the first column are recorded production orders or purchase orders for material bought from an outside source. The figures in this column give a running grand total of the production or purchase orders for each part during the fiscal year, which consists of the 12-months' period from one annual inventory to the next.

Data Regarding Outside Purchases Recorded

In the second and third columns, designated "invoiced" and "received" respectively, are kept data regarding outside purchases, the date of the invoice and the date that the material was received. These columns are not used for production orders going through the company's own shop. When material reaches the finished stock room, whether it comes from an outside source or from the shop, the information is entered in the fourth column marked "to stock." Each day's cumulative orders for each part are recorded in the fifth and sixth columns, which are headed by the title "sales." Incidentally, these two columns do not tell the size of individual orders or where each order is going, this information being given on another sheet.

The total of ordered parts (obtained from the first column) minus the total of parts in the finished stock room (fourth column) gives the number of parts in process. This, of course, is based on the assumption that all of the parts ordered have already been started through the shop. The stock total (fourth column) minus the sales total (fifth or sixth column) gives the number of finished parts in stock available for sale.

At the top of the sheet, opposite "date and source," are given the name of the company from which outside purchases have been made and the date the first order was placed with that source of material. The serial number of the part, its name, size and finish are put at the bottom of the sheet. The "minimum" for the part also is recorded. By "minimum" is meant the minimum amount of each part that should be kept in finished stock, this figure being derived by multiplying the total sales of that part for one month by the number of months necessary to produce or procure from an outside source that particular part, for obviously it is essential to keep on hand in finished stock enough parts to supply customers for that period.

Every time the "available for sale" amount falls below the minimum, the "supply and demand sheet" is scanned to determine whether a new minimum should be set. Here the sales record is the guide. For instance, if 300 units of a part are the average monthly sales, and two months are allowed for replenishing stock, the minimum would be 600

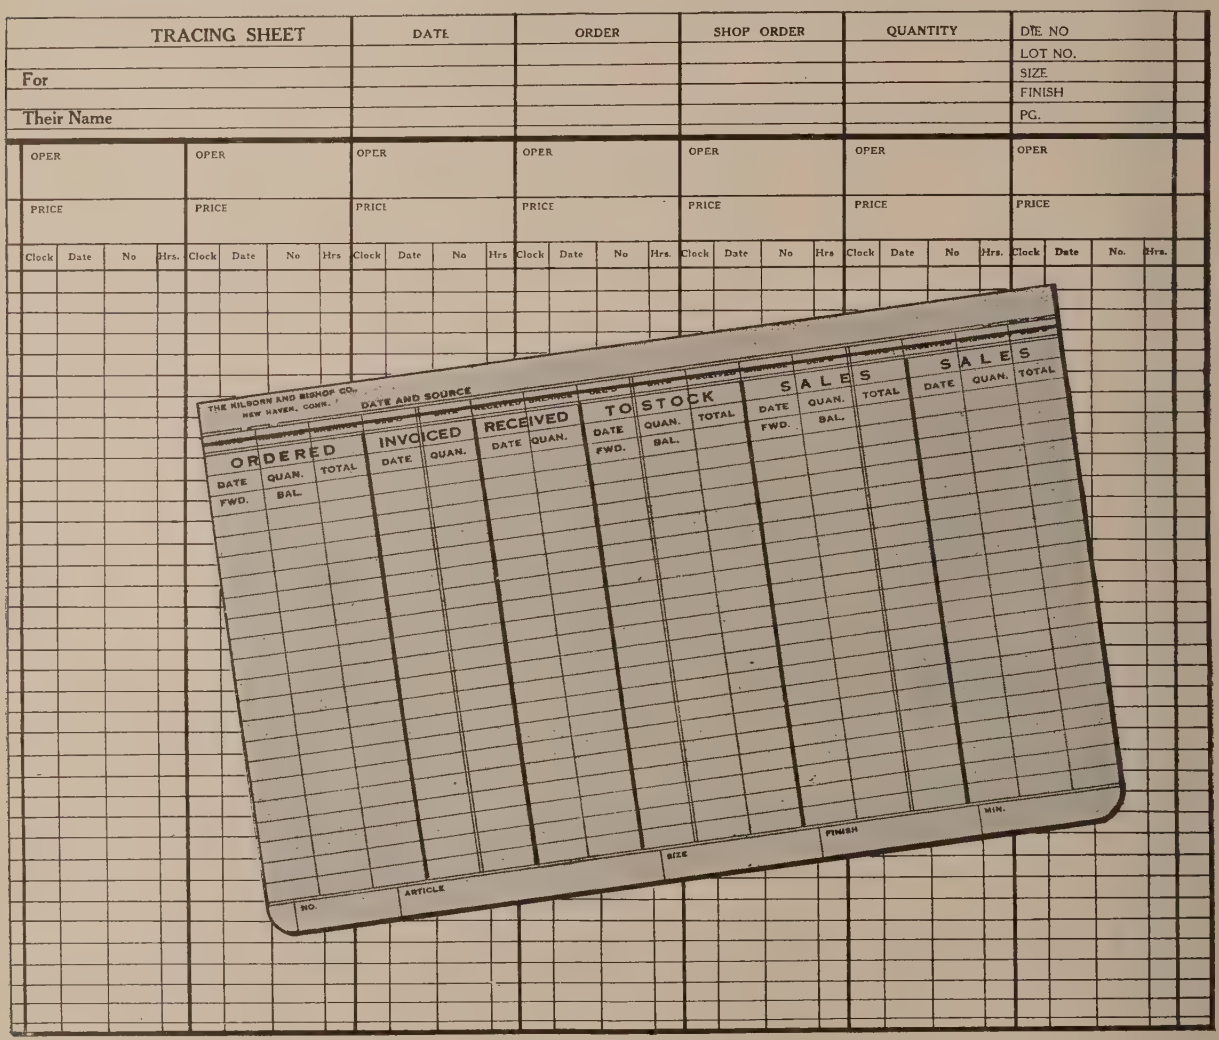
units. When the amount "available for sale" drops below 600, advantage is taken of the opportunity to see whether recent sales have been averaging 300 units a month. If not, the figure for the monthly average is changed to conform with the requirements of the situation and a new minimum is set.

When the number "available for sale" is below the minimum, a signal is attached to the center of the card. In an emergency, when there actually is a shortage and stock at hand is not sufficient to fill orders (that is, the "available for sale" is a minus quantity or the sales are greater than the stock), the signal is put at the right side of the card. Ordinary paper clips are used for danger signals. The company believes that clips are the cheapest and easiest article to employ for this purpose.

minimum, based on the experience of the preceding two months, is usually established.

When a card is started for a new part, in the "ordered" column is placed the total supply available or soon to be available, which includes the number in finished stock, the number in process and the number on production orders on which manufacture has not yet begun. As each production order is issued, the number of parts on that order is added to the total already in the ordered column. In the "to stock" column is entered the number in stock and each delivery to stock is added. In the sales column the number of unfilled shipping orders is first entered and then every additional order received by the sales department is added.

Any red entries on the sheet are of a negative char-



Control of Stocks Revolves About a Supply and Demand Sheet (Center) Which Is Equivalent to a Perpetual Inventory of Material in the Plant. A tracing sheet has been provided to keep track of material in process between the time it is entered in the ordered column and in the stock column of the supply and demand sheet

If the minimum plus sales is greater than the number of parts in stock, the stock is low and deliveries from the production department to the stock room are closely watched. On the other hand, if the minimum plus sales is greater than the number of parts ordered, more stock must be ordered from the production department. During the first two months of the current fiscal year, the monthly sales average from the previous year is used to determine the minimum. At the end of that period, however, a new

acter. In the stock column they are goods which for any reason have been returned from finished stock to the shop. Red in the sales column is the sign of either a cancellation or a returned shipment. Only in these few cases is there any subtraction on the sheet. One of the main purposes in originating the sheet was to get away from subtraction, in which tests have proved that employees make far more errors than in addition.

To keep track of material in process between the

TOTAL Sums from Tracing Sheet Are Transferred for Filing Purposes to a Rate Card (Above) Which Contains Condensed Information About Rates of Various Operations in Producing Parts

* * *

WHEN Parts Are Rejected by Inspectors or Pieces Are Spoiled in Production Departments, a Scrap Report Is Sent to the Office to Be Scanned by the Management

time it is entered in the "ordered" column and in the "to stock" column, a tracing sheet has been provided. One tracing sheet is used for each production order. However, if a second order for the same part is issued before the first is completed, the information is put on the same sheet. Data contained on this sheet include the names of the various operations in manufacturing the part, the piece-work price (if any), operator's clock number and date worked, number of pieces on which operator worked and time consumed in doing the work.

The total sums from the tracing sheet are transferred for filing purposes to a rate card, which contains condensed information about the rates of the various operations in producing the parts. The time for making forging dies and other tools, fixtures and repairs also is tabulated.

The shop production schedule is usually decided upon by the chronology of orders. However, the matter of giving precedence to special orders is determined by an informal conference of the sales manager, general manager and shop superintendent. All parts are manufactured in accordance with instructions on a general production plan sheet, which lists the order in which various operations are to be done. One copy of the plan sheet goes to the shop and one is kept on file in the office. There is a plan sheet for each part.

Annually in July a physical inventory of materials is taken. The stockkeeper in charge of the stock room makes an actual count of finished parts and puts the record for each part on a separate inventory card, which is sent to the office. The cards are sorted according to general ledger accounts, the sum totals of the general ledger groups being transferred to inventory ledger sheets.

In the matter of inventories, the fundamental rule of the company is to calculate each part of the annual statement to the same degree of accuracy as every other part. For example, it is regarded as distorting values to determine within a few cents the worth of a lot of material totaling possibly $5 when it is a matter of judgment whether a machine costing $1,000 shall be depreciated $50, $100 or $150. The company is of the opinion that any item appraised within 5 per cent of its actual value for inventory purposes has been calculated closely enough. In these cases the theory that all errors are compensatory is followed. Thus, if all errors are within 5 per cent of the actual value, the average of the grand total of the inventory would be within ½ per cent.

When parts are rejected by inspectors or pieces are spoiled in production departments, a scrap report is filled out and sent to the office for perusal by the management. The report contains the die number, last operation on the piece, quantity, order number, reason for scrapping and the name of the inspector who was responsible for scrapping the material. The operators know that a report of all scrapped material goes to the office and consequently the psychological effect is beneficial.

Orders for special forgings are handled in a slightly different manner than orders for stock items. The tracing sheet and the rate card are retained, but instead of the supply and demand sheet a master card is kept. It contains the customer's name and address, description of the forging, die number, size and weight of stock, size and quality of die blocks, finished weight, order number, date, quantity price and material cost. A separate card is used for each special part.

The entire system has been designed to handle periodic production of the same pieces and from it many benefits have accrued. Complete information regarding production control and the rate of operations is tabulated on three sheets: the supply and demand sheet, tracing sheet and rate card. In fact, the tracing sheet is only of temporary service, as it is filed after the totals have been transferred to the rate card and is seldom referred to later.

From an inspection of previous sales, as reflected by the "minimum" figure on the supply and demand sheet, the management can tell instantly at what rate the shop should turn out any given part at any given time. The system also reveals at all times what the shop has been asked to produce, what it actually has produced and what amount the sales department has sold. Moreover, it shows the rate of production on all previous orders, a matter essential in determining manufacturing costs. It sets forth the facts necessary for the management to operate its business intelligently and accomplishes efficiently what much more elaborate systems often fail to achieve.

Money Rates as a Business Forecaster

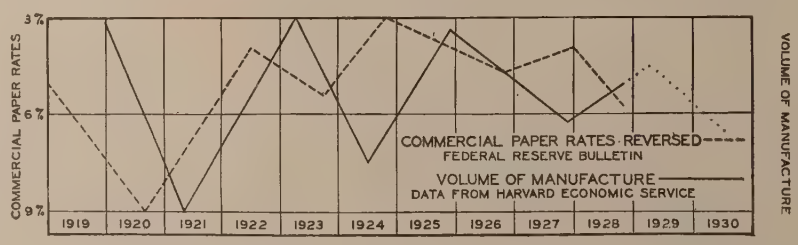
MAJOR swings in money rates have forecast accurately, many months ahead, the major fluctuations of business activity for 1927, 1928 and 1929—and, it might be added, for every year since the war, says Alvan T. Simonds, president, Simonds Saw & Steel Co., Fitchburg, Mass., in *Looking Ahead* for Nov. 1.

Using major swings in commercial paper rates as a business forecaster, it was evident at the beginning of 1927, he asserts, that 1928 would probably be a year of revival. This forecast was corroborated as the decline in 1927 developed and continued to the end of the year and as money rates moved lower all through the year (1927), making for a rise in business activity in 1928. Similarly, at the beginning of 1928 money rates began to move up and continued upward through that year and the greater part of 1929, indicating that the cyclical peak of business activity would come in the first half of 1929 and would be followed by a falling off.

Since the war rising money rates have been followed, after a long lag, by declining business and easing money rates have been followed, after a similarly long lag, by improving business. The long lag is seldom recognized, says Mr. Simonds. Business in the United States is too big, its inertia is too great, to be stopped and turned in a different direction at once—indeed, it requires months.

On this basis Mr. Simonds believes that the next major upswing in business activity will begin nine to 15 months after the approaching turndown in money rates.

He also calls attention to the fact that each major falling off in business since the war has been less severe than the previous one. The recession of 1927 was briefer and less severe than that of 1923-1924. The recession of 1923-1924 was decidedly less severe than the depression of 1920-1921. Emotional pessimism would now be a mistake, in Mr. Simonds' view, since it would help to increase any recession of business that may be ahead.



The Curves for Commercial Paper Rates (Reversed) and Volume of Manufacture Show Correlation, But There Is a Lag Between Them

Heat Treats Stainless Steel Tubes

British Firm Forms Soft Strip into Tubing and Draws It Through Pair of Dies with Electric Furnace Between

SINCE 1924 Boulton & Paul, Ltd., Norwich, England, has been engaged on research, design and constructional work for the Air Ministry in connection with the giant airship R-101 (described in considerable detail in THE IRON AGE, June 27, page 1753). In this time the firm has successfully developed new types of members, materials and methods of manufacture. In the latter part of 1924 two experimental longitudinal girders were constructed of the type ultimately adopted for the ship, incorporating several patented features, in particular the use of the process for continuously heat treating steel members after forming, and embodying the results of the research work on structural stainless steel which had been under way for a year or so previously. It was this work which rendered possible the use of stainless steel for airship construction.

For many years aircraft practice in Great Britain had been to form the required section from the already hardened and tempered strip, the forming being carried out either by rolling or drawing. These operations involved shaping the strip only, and not a reduction of thickness. It was realized, however, that this method of forming would not be particularly suitable for large scale production owing to the facts that

(a) The strip used, which had been hardened and tempered in the coil, was not uniform in its mechanical properties along its length; hence the "spring back" from the rollor die was not consistent. This resulted in uneven sections being produced at the first pass, and often the irregularity was so marked that the section had to be passed through dies several times to make it more uniform.

(b) The design of sections was limited by the ductility or lack of ductility of the hardened and tempered strip.

To avoid these disadvantages there was developed a method of working the softened strip and, after having completely formed it to the requisite shape, carrying out the hardening and tempering by a continuous process.

Solid drawn tubes were not and are not now available in the material, size and mechanical properties required for the airship, viz., to quote one item: 1¾-in. tubes in metal ranging from 26 to 20 gage, length up to 47 ft., and having a minimum proof stress of 145,000 lb. per sq. in. The above process therefore, then in its early stages of development, was the only method of providing the required sections. The fact that quantities like 30,000 ft. of 1¾-in. tube for longitudinal girders have been produced shows that the method is a practical one for production working.

Plant for Fabricating Shapes

The actual plant used for the manufacture of the airship section comprises four drawbenches, shown in an accompanying illustration, each 70 ft. long, two rolling machines, one strip cutter and one section cutter.

The drive of the drawbench is through a friction disk so that a variable speed of pull is obtainable, which is also capable of being very gradually changed. Dies are held in special holders fitted to the drawbench channels and definitely locked in position by a downward moving head operated by a hand wheel.

Speed is controlled from the die head end of the bench by means of a push rod, so that the operator setting the dies can readily control the speed of the chain.

Each drawbench may also be fitted with an electric fur-

Carbon	0.19 per cent
Silicon	0.41 per cent
Manganese	0.27 per cent
Chromium	13.9 per cent
Nickel	0.22 per cent

nace at the die holder end and also, as speed of drawing is of vital importance when the section is being either hardened or tempered, a speed indicator is attached to each bench.

Drawing of Section

Sections such as the 1¾-in. tubes used for the longitudinals are made entirely on the drawbench. The flat strip, in its softened condition as received from the makers, is passed successively through a series of dies until the desired shape is obtained. It should be noted that these drawing operations merely form the strip to a particular shape and that the gage of metal remains constant throughout the whole process.

For close jointed tubing (such as is shown in the frame longitudinal) the necessary corrugations are first formed along the edges by drawing the strip through dies and then the whole bent to curved shape. The final seaming is carried out by pulling this section through a circular die and over a mandrel shaped so as to fold the corrugated edges over one another.

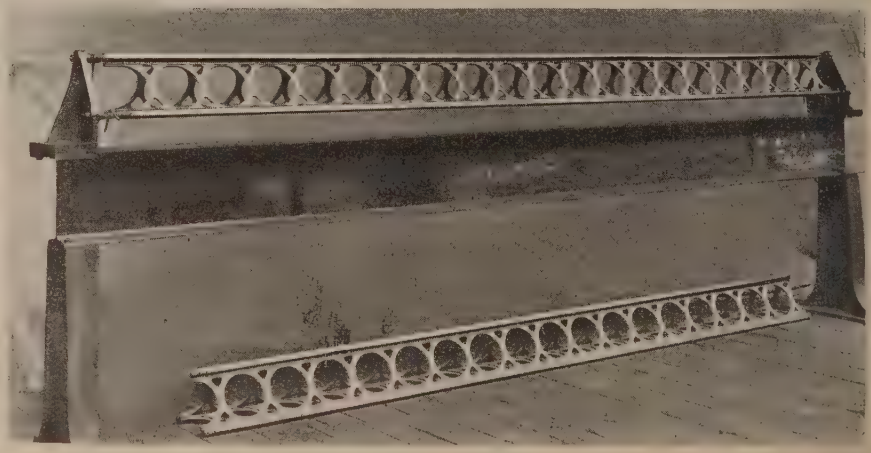
A 70-ft. tube can thus be formed easily; all work is carried out while the steel is in annealed condition.

Physical Properties of the Steel Used

Stainless steel strip of a composition within the limits indicated below has been used for all members such as close jointed tubes, which are formed on the drawbenches and hardened and tempered by the Boulton & Paul continuous heat treatment process:

Carbon	0.16 to 0.22 per cent
Silicon	Not exceeding 0.5 per cent
Nickel	Not more than 1.0 per cent
Chromium	12.5 to 14.0 per cent

It has been found that steels in this range, after hardening from a temperature of 960 to 1000 deg. C. and tem-



RIDGE Girder in End-Fitting Jig. Stainless steel tubing with open joints is used at the angles, riveted to duralumin webs, flanged around all openings so as to combine lightness and stiffness

pering at a suitable temperature, have the following mechanical properties:

Proof stress ..... Not less than 145,000 lb.
Ultimate stress.... 200,000 to 215,000 lb. per sq. in.
Close bend (transverse) ..... Around pin three times the thickness

A typical stress-strain diagram is shown in Fig. 4.

Proof stress is defined as that stress at which the stress-strain diagram departs from the straight line of proportionality by 0.1 per cent of the gage length.

The Continuous Heat Treatment Process

As before remarked, each of the 70-ft. drawbenches may be equipped with a wire-wound electric tube furnace, fitted with automatic temperature control. When heat treating is to be done on fully formed sections, one such furnace is brought up to heat, say 50 deg. above the correct temperature for the steel, and a die set up on the entry side of the furnace of such size that there is a little friction offered to the passage of the section through it.

Full lengths of the formed section, such as close jointed tube, are then fed through at a rate which is dependent upon

(1) The nature of the operation—whether hardening or tempering.

(2) The class of steel.

(3) The form of the section.

(4) The gage of the strip from which the section was formed.

(5) The mass of steel per linear foot.

The section is raised in temperature and soaked at least two minutes at the hardening or tempering temperature before emerging into the air. After traveling in air a few inches, the section enters a cast iron water cooled die (set in the die holder of the drawbench) which completes the cooling and maintains the section in its correct shape. What really happens in the hardening operation is an air quench; the section has cooled through its critical range before reaching the water cooled die. An air hardening steel must therefore be used. The first die, ahead of the furnace, merely maintains sufficient tension on the section while in the furnace to insure straightness in the finished product.

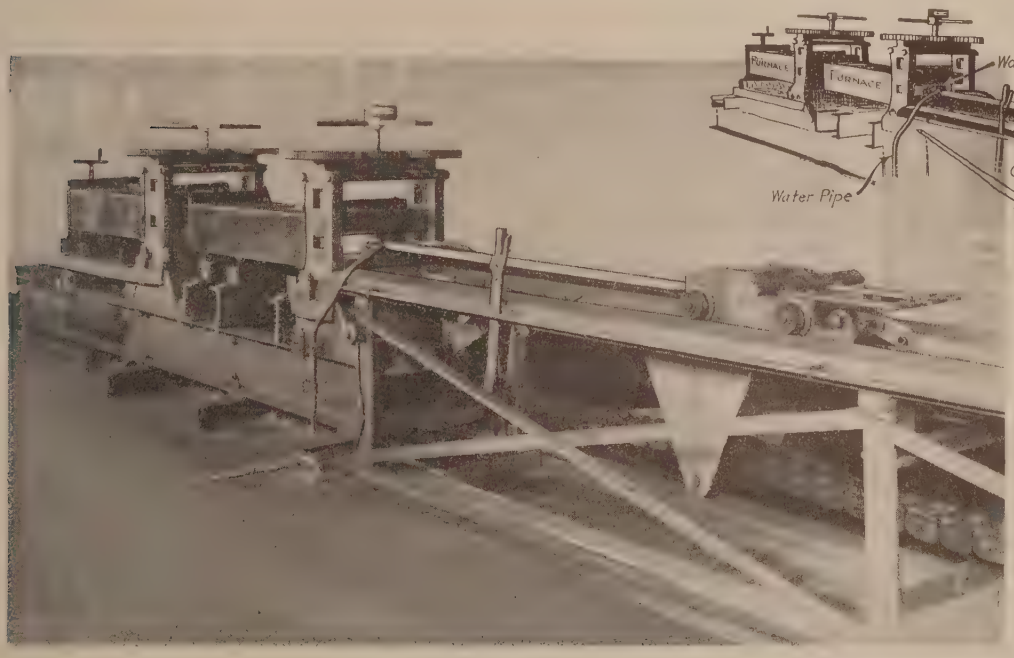
Formidable practical difficulties were encountered in the hardening of stainless steel in the early days, due principally to two things:

(1) The high hardening temperature, 960 to 1000 deg. C.
(2) The comparatively slow and variable response to heat treatment of the stainless steel used

However, a few miles of strip in this difficult steel have now been successfully and uniformly heat treated in equipment such as shown in one of the illustrations. But this has been achieved only by the closest attention to every detail, involving

(1) Very close knowledge of the composition and microstructure in the annealed state of the strip to be treated
(2) Close control of temperature
(3) Close control of rate of feed through the muffles

The tempering operation is very similar to the hardening described above, with, of course, a suitable adjustment of temperature. For most of the stainless steel used for the airship a temperature between 420 and 450 deg. C. has been used. In order to speed up the rate of drawing two furnaces are put in tandem on one bench for this operation.



CLOSE-UP of Die Holders on Drawbench Arranged for Tempering Tubes for Airship Booms. Note how rigidly the dies are held in adjustable fixtures

Uniformity of the Product

The product is more uniform than has been found in steel strip hardened and tempered in the coil. Coil treated strip often showed a variation of as much as 50,000 lb. per sq. in. in the tensile strength along a length of 60 ft. As typical of the continuous process, a 50 ft. close jointed tube in stainless steel made in the above manner was taken at random and cut into short test lengths. The size was 1¾ in. by 20 gage, i. e., most difficult from the heat treatment point of view. The tests fell within the following range:

Proof stress..... 145,000 to 154,000 lb. per sq. in.
Ultimate strength..... 198,000 to 208,000 lb. per sq. in.
Transverse closed bend.. 2¼ to 3 thickness

Control Tests on Heat Treated Sections

Rockwell hardness tests and close bend tests are carried out on each end of every section after cutting to

length (an allowance being made on the length for test purposes).

With the difficult steel used, direct correlation between the Rockwell machine and the testing machine is realized by furnishing the Rockwell machine with tensile test pieces which have been pulled for proof stress and ultimate stress. It is necessary to supply such test pieces representing every cast of steel used, every gage of strip and every annealing heat (by strip rollers).

The special character of the steel is responsible for the multiplicity of the comparison standards.

Special combinations of loading and penetrators of the Rockwell machine are necessary for dealing with very thin strip, such as 26 to 30 gage.

Cutting to Length

These hardened and tempered sections are cut by means of a mild steel disk, about 16-gage thick, running at high speed. It is found that this method is quick and very economical.

The machine carrying the disk is fitted with a quick clamping device on a moving table, and by the turning of a handwheel the disk is brought in contact with the section.

Germany Extruding Seamless Tubes of Stainless Steel

MARKED developments in the making of seamless tubes in Germany were reported in an address at Akron, Ohio, Oct. 23, before a sectional meeting of the American Society of Mechanical Engineers, by Prof. W. Trinks, Carnegie Institute of Technology, Pittsburgh.

The Mannesmann Tube Co., he says, extrudes seamless tubes up to 3 in. in diameter, and what is more, of stainless steel. Each tube is extruded vertically downward by means of a 4000-ton press at high speed (a 25-ft. tube in 1 sec.), is moved sideways and is cut out of the die by a rotary knife. Nothing is said, he added, about the material of the dies. They are air cooled between operations, and are similar to the mandrels of our present-day seamless mills, as far as heat action is concerned.

The Pilger mill, Professor Trinks finds, no longer reigns supreme. This mill, which received its name because the pilgrims on the way to Andernach walked five steps forward and three steps backward, "wears out of true quickly and is therefore quite well adapted to small orders of different size, which require frequent roll changing anyway, but is not suited to large orders. German engineers and manufacturers realize this situation and are therefore following our lead. They state that for seamless tubes of 3 to 6 in., single piercing and an automatic mill are correct, and that for 6 to 10 in. or 11 in., so called double piercing is correct. For 12 to 24 in. double piercing and expanding is recommended."

Has Mandrel in Tension

Several expanding mills, it appears, are being developed. The Mannesmann company has a mill which is similar to the Stiefel expanding mill, but uses a tension mandrel instead of a compression mandrel. It is claimed that the compression mandrel, due to vibration of the mandrel rod, produces a pipe of variable diameter, which requires much reeling. The tension mandrel is claimed to be free from this trouble. The Deutsche Machinen Fabrik is likewise developing a new expanding mill.

He mentioned a new piercing mill, which has two rolls on each side to take the place of the present piercing mill roll, so that there are four rolls, all told; two rolls form the converting part of the pass, while two other rolls form the diverging part of the pass. Up to the present time, he added, only small sample tubes have been rolled, and German mill engineers doubt the usefulness of this design for commercial tubes.

Pipes, boiler drums, and reaction chambers of more than 24-in. diameter are either hollow-forged, or welded or rolled by a new process. He said boiler drums are frequently welded of two half shells and that the boiler makers are allowed 90 per cent of the strength of an integral shell, whereas here in the United States such procedure is prohibited under the boiler code of the American Society of Mechanical Engineers. The welded shell is turned and bored, and tested hydraulically. Then the ends are wedged down, and the drum is tested once more under hydraulic pressure.

Rolling from Large Hollow Ingots

He agreed that the cost of welding sections three or more inches thick is high. Accordingly, "one steel works has developed a process in which ingots are cast hollow over a collapsible core. The hollow ingots are then elongated by means of a special rolling mill which applies a number of small rolls, say six, on the outside and an equal number of rolls on the inside of the hollow ingot. The rolls are designed for great elongation and are set slightly on a skew so that they both rotate and feed the ingot forward. Seamless tubes up to 40 in. in diameter and 30 ft. long have been rolled by this process.

In making the molds for the hollow ingots, a new core material is used which costs only 1c. a lb. but is limited to 4½-in. thickness of ingot wall. For similar purposes another core material has been developed which consists of aluminum oxide with some aluminum nitride (to act as a binder). It can be used for any wall thickness. The same material is also used in Germany as a wash for cores of steel castings and is claimed to have reduced the cost of cleaning castings by more than 50 per cent.

One of the most striking fruits of X-ray investigation is the recognition of the somewhat complex cell structure which exists in certain alloy bodies which are commonly described as intermetallic compounds, said Dr. Walter Rosenhain, in an address before the recent meeting of the British Institute of Metals. A large amount of further work remains to be done before this question can be cleared up. Closely allied to this problem is the question of the real nature of the complex structure found in certain pure metals, notably manganese, which displays a striking similarity to the structure of the peculiar intermetallic combinations previously mentioned. It would appear that the underlying laws of intermetallic combination have yet to be discovered, and that the true nature of intermetallic compounds and the features which distinguish it, if a true distinction exists, from a solid solution, have yet to be accurately defined.

Three rare metals are interestingly discussed in an attractive and well illustrated booklet of 58 pages issued by the Fansteel Products Co., Inc., North Chicago, Ill. The three metals are tantalum, tungsten and molybdenum, and their history, properties and uses are discussed. About 15 pages are devoted to "Tantalum, the Everlasting Metal"; about 10 pages to "Tungsten, the Metal of Another World," and 6 pages to "Molybdenum, the Metal of Radio." A concluding section of about seven pages deals with facts and figures on rare metals.

Modern Electrical Repair Shop

Steel Mill Requirements in Keeping Its Many Motors in Active Service—Should Not Manufacture Parts

BY J. M. ZIMMERMAN*

ON building a new repair shop a steel mill purchased some $30,000 worth of modern equipment. A great deal of thought was given to the layout of this shop and its system of costs. It is now operating, with an enviably low maintenance cost.

In laying out a modern electric repair shop all lost motion in man-hours may be kept low by proper arrangement of the shop. The places to which the workman must have access while performing his tasks—tool and stock disbursement window, time clerk's window in foreman's office, and washroom—should be located centrally, where his coming and going will not interrupt the workmen in other groups.

With this in mind the foreman's office is in the center of one wing of the building, with the washroom on one side and the storeroom and toolroom on the other. The stock and tool disbursement window is as near the foreman's office as is convenient, so that it will be near the center of the building. The stores office is in the corner of the storeroom, next to the foreman's office, but is not connected to it except by a window through which the necessary clerical work passes. The receiving door is at the far end of the storeroom.

If the roof of the building is high enough the space above the foreman's office and the washroom can be utilized to store parts, such as armature coils, which must be kept in their original shipping containers until they are used.

An overhead crane is essential for quick handling of heavy motor parts. The plan as shown in Fig. 1 provides such a crane to span the center bay and travel its entire length. Machines handling the heavy work are located in this aisle, while those doing the light work are located in bay III, with the exception of the coil repair department, which occupies the end of bay I.

The shop is divided into nine sections, each being separated from the other by white lines on the floor. Two wide aisles at right angles are provided for electric truck traffic. One runs from the foreman's office through the center of the building to the exit on the opposite side, while the other runs the entire length of bay III. These

Dynamometer Testing Set, with Control Board, for Load Testing. The frame permits easy alinement for motor shaft

arteries enable small shipments of stock to be brought in or removed from the shop quickly.

Since the receiving and shipping department is the beginning and finishing of any job, we have arranged the shop to receive and ship the work at the end of bay II. The outside doors permit a motor truck to enter. The part to be repaired is lifted by the crane off the truck and over the wall to a section reserved for this material. This wall serves as a shield, so that the doors can be opened without chilling the shop. The storeroom is connected to this truckroom also, and a monorail crane is provided to lift the electrical supplies from the truck, thereby saving the storekeeper the labor of handling them.

Testing Department

The testing department is conveniently located between the unloading department and the assembly floor, to eliminate excess handling of complete equipment. When a motor comes into the repair shop for repairs it is moved to the testing department, where the extent of the repairs is determined. From the test floor it goes to the assembly floor to be disassembled. On its outward journey it returns from the assembly floor for a final test before being shipped.

Equipment in the testing department includes the dynamometer and control board for load testing. The control board has four panels, one for starting and controlling d.c. motors; another for starting and controlling a.c. motors, both wound and squirrel-cage type; a third for controlling the load on the generator; and a fourth for power distribution. The control equipment on these panels is designed to handle the maximum output of the dynamometer.

The dynamometer set as shown was made by the Miller-Seldon Co., Detroit, for quick connecting and disconnecting of motors to generator. The generator is of sufficient capacity to overload by 50 per cent the largest general-purpose motor in the plant, for a period of 15 minutes to obtain the best results.

A welded fabricated steel frame mounts generator and motor. The platform on which the motor is to be mounted for quick alinement to the generator shaft is raised or lowered by four jackscrews, one at each corner. Each screw has a sprocket wheel, all driven by a common chain, for the raising and lowering operation. The outside corners of the platform should be supported by feet sliding up and down, as shown. When the correct height of the table is obtained, these feet should be permanently clamped so as to form a solid base for the motor, thereby eliminating vibration. The platform has two steel cross channels which can be spread to fit the various feet dimensions of any motor being tested.

A lathe chuck pressed on the generator shaft will receive several sizes of center pins, as needed to fit the various sizes of centers in different motor shafts. A dog placed over the motor shaft serves to drive the generator. This manner of connecting the motor eliminates a lot of sizes of couplings and makes it possible to operate the set efficiently without accurate alinement of the shaft.

Assembly Floor

After disassembling equipment to be repaired, the assembly floor distributes parts to the various departments where they will be repaired. Such repairs made, the parts are assembled and the equipment is turned over to the testing department for final test. This department should be fitted with a complete set of wrenches, each in its own place when not in use. In addition there should be a portable drill, air hammer, and pinion puller. This depart-

ment is the most convenient place for locating the emery wheel and buffer.

Miscellaneous Section

Cleaning booth, babbitting pot, bearing machining lathe and welding booth are in one section. The motor details are sent to this department from the assembly floor for cleaning. The cleaning booth has a pickling vat and a rinsing vat, both large enough to hold the largest motor frame.

Any mechanical part which does not have insulation attached is dipped first in a caustic soda bath, and then rinsed in a bath of water. Field coils and armatures are cleaned by the gasoline spray method. The booth has two sprays for painting and for gasoline cleaning. The latter has a valve which will pass a spray of gasoline and air, or just a spray of air to evaporate the gasoline after cleaning. All repairs are sent to this booth to be painted before leaving the shop. The painting spray may be taken to the apparatus and connected to an air line for painting. This room is ventilated by an exhaust fan.

The bearings after cleaning are re-babbitted in an electric babbitting pot. This can be mounted on a truck so it can be taken out for babbitting large bearings which cannot be conveniently brought to the shop. After babbitting, the bearings are machined to fit the armature shaft on which they are to be used. For this reason the department has a small lathe.

A 35-ton forcing press is provided for pressing a bearing into a housing. In this case the bearing is machined if necessary, after it has been pressed into the housing. To do this requires a large lathe which can swing the housing.

A portable welder for the welding booth sets under the work bench, thereby being out of the way. It can be taken easily to other parts of the plant, if necessary. This booth has also a portable gas torch. An exhaust fan removes excess welding heat and thereby provides a comfortable working place for the welder. Outside the booth is a Martindale flexible-shaft emery wheel to smooth off the welds and rough spots. This grinder, on a portable stand, can be moved to other departments, wherever it can be used to advantage—especially the armature stripping benches, where it is used to clean out armature slots.

Machine Department

The machine department should have suitable tools to handle the necessary repairs, and make parts only in emergency. It is false economy to be equipped to machine from rough stock parts which can be purchased from the manufacturer of the original equipment.

It is desirable to have a 100-ton hydraulic press to remove and assemble armature shafts, tighten commutators, etc. A large machine lathe is sufficient for this section, as the bearing and armature winding departments have their own lathes. A planer and a milling machine are handy, but could be omitted. A large drill press is necessary.

Armature Repair Department

To rewind armatures and stators, the usual armature-winding horses and stator-winding tables are required. The banding lathe for this department should have a tension device for keeping the proper tension on the banding wire. A separate undercutting outfit is essential, so that the commutator can be undercut and polished on the machine. The dipping tank should have a hinged cover opened by a weight connected to it by a rope passing through a pulley. In case of fire this rope would burn in two and let the cover drop on the tank.

A swinging crane with chain hoist handles the parts to be dipped, and holds them above the tank for draining. After dipping they are put on a car and rolled into an

automatic temperature-controlled electric oven to be baked. Along the outer walls is a tier of bins to store cut insulating material for the convenience of the winding department.

Repair of field and magnet coils, and general repair and replacement of insulating details on various kinds of apparatus, occupies the coil-repair department. It has a shear to cut insulation, a band saw to cut commutator mica strips, bench drill, press, electric glue pot, field-coil testing outfit and a taping machine for general repair work. To provide for emergency it has also a winding head and coil puller, so that coils can be made.

Small Motor and Commutator Repairs

Commutators should always be tightened with a press after heating, so this section is located close to the hydraulic press and the baking oven. Since it is easier to assemble the commutator details with the armature vertical, a portable stand to hold the armature in upright position during repair is provided, thereby maintaining a quick method of moving it to the press and thence to the oven.

It does not pay to rewind small motor armatures if a man's time is taken up wholly to do this type of work. But it does pay to have a man do this work during spare time. Hence this department has a small motor armature-winding tool.

Miscellaneous Detail Repairs

Odds and ends of control and motor details are brought for repair and reclamation to the miscellaneous detail section. The best facilities here are several good vises, a bench drill for light work, small emery and buffing wheel and a hand press for removing and replacing worn bushings.

The economics of repairing and reconditioning of electrical parts is quite similar to that of repairing and reconditioning the mechanical parts of any other type of machines. It is essential that the various operations be carefully studied so that the organization will perform them with the least amount of effort and time. With this type of shop lay-out we feel that an economical repairing schedule can be properly maintained.

British Comment on Chromium Plating

Temperature a Factor in Successful Results—Porosity Often a Source of Trouble—Experience Important

CHROMIUM plating is recognized as having wide possibilities if a surface can be produced that is unstainable for an unlimited time. There has been some question as to the success of the coating in the United States and according to a British authority, W. E. Harvey of Harcourts, Ltd., reports as to its success have varied in England.

In some trades, especially in motor car work, it has been pronounced an unqualified success. Brass founders have had very indifferent results at times, says Mr. Harvey in *Ironmonger*, London, but in the manufacture of bathroom fittings chromium plating has become an indispensable finish, its wide adoption in that branch of the trade being pronounced remarkable. Theoretically, a coating of chromium, glass hard, of polished, silver-like appearance, applied under the same conditions, should remain a permanent untarnishable surface as long upon one brass article as upon another. In practice it does in most cases, but not in all; hence the doubt which has arisen as to whether it should be depended upon as a sound commercial proposition.

Effects of Temperature

Chromium is an exceedingly hard metal and is affected by variations in temperature in a different degree from the metals upon which it is deposited. Although the differences in contraction and expansion are very slight, the possible effects in some cases are obvious. It may be that an intermediate elastic medium is required. Sometimes under coats of copper, or nickel, or both, are found to be a satisfactory base for chromium deposit. In other cases there is no necessity for this. It depends upon the metal to be plated, the shape and thickness of the article and the use to which the article is to be put. A thick metal article may be a different proposition from a thin one, and so on. Every chromium plating job presents its own problem, and the expert realizes when he sees an article where trouble is likely to occur. Want of experience is responsible for many so-called "mysteries."

Porosity of Plated Product Cause of Trouble

Porosity of a plated surface is often responsible for trouble. As chromium plating is a high-class finish, it is worth while using good quality metal in the manufacture of plated articles, and using dried molds, too, when the metal is in the form of castings. Apart from the trouble that may be caused by the exudation of acid from "blow holes" under the chromium deposit, there is the question of appearance. A pitted surface may not be conspicuous with a brass finish; but defects of this kind are necessarily accentuated by bright plating. The thickness of the deposit is important, and information and advice upon this point should be sought from platers.

A fairly thick deposit is essential in many cases, and it is not every plant that is capable of giving the required result. In preparing the surface of an article for chromium plating it should be remembered that, if it is well "dressed" and polished, the result will repay the extra care in workmanship involved. All these are points worth keeping in mind, and many disappointments will be obviated by doing so.

Unsatisfactory Work a Bogey

So much for the origin of much talk about chromium deposit being unsatisfactory. It would, indeed, be surprising if, in the case of a new process of this kind, every small plating plant could reach perfection straight away. Further, it would be astonishing if even the larger plants, where research work is carried out to discover the cause of defects, could be absolutely proof against every possible cause of trouble, seeing that there is nothing in human experience that has yet reached this ideal state.

Although chromium plating has so far been mainly considered in regard to its virtue as a "finish," this is far from being the end of its uses or even, perhaps, the most important, says Mr. Harvey. Its application to molds and tools has been so successful in increasing their wearing properties and in other respects that it is in regular use for these purposes. Here, again, the correct method of plating must be adopted or it is useless.

As a final word, it may be pointed out that there has been much misunderstanding regarding the cleaning of chromium. There is a great difference between cleaning and polishing. While the latter is unnecessary, the former is essential, and is easily done by rubbing over with a damp cloth and finishing with a dry one.

Institute Unalarmed by Stock Break

Calm Confidence in Sound Position of Business Characterizes Both Public and Private Expressions at Hotel Commodore Meeting

CONVENING in its thirty-sixth general meeting the day after one of the worst stock market crashes in history, the American Iron and Steel Institute was undisturbed by the alarm that had captured an excited Wall Street. Both public and private expressions by leaders of the iron and steel industry reflected calm confidence in the sound position of business and the reassuring outlook for coming months.

Mill Operations Still Good

The growing stability of the iron and steel trade and the absence of price inflation were stressed by President Charles M. Schwab in the opening address, Friday morning, Oct. 25, in the Grand Ball Room of Hotel Commodore. Extemporaneous remarks from the platform by James A. Farrell, president of the United States Steel Corporation, were also encouraging. Pessimism, he declared, is not justified so far as the steel business is concerned. Operations, at 75 to 80 per cent, are good. Demand is sustained except in one or two lines and in some directions is even better than six months ago, he declared. Shipbuilding and structural steel fabricating plants are unusually active, being booked four to six months ahead.

Enlightened Selling Urged

Both Mr. Farrell and Mr. Schwab stressed the need for an enlightened selling policy, now that trade has receded somewhat from its peak volume. "If the people of the steel industry cannot maintain their equilibrium, we won't have good business," asserted Mr. Farrell. "If we fail at this juncture and violate the golden rule as between men and as between companies, then we can blame ourselves for anything that happens that will make the situation any different from what it is at the present time."

The cost sheet was recommended by Mr. Schwab as a means of forestalling an unsound price structure and of discouraging attempts to produce at capacity regardless of demand. He emphasized the fact that the industry's favorable showing this year has not been due to higher prices, but rather has resulted from greater demand for steel, enlarged output and lower costs.

The price stability of the past year has benefited steel consumers, according to Mr. Schwab, because it has enabled them to operate on a non-speculative basis. Steel buying has been for current consumption, and no big inventories have been built up. Since prices are not inflated, he added, there is no reason why they should give ground because of the present slight let-up in demand.

Willis L. King, veteran vice-president of the Jones & Laughlin Steel Corporation, also made a few remarks from the platform, at the conclusion of Mr. Farrell's speech. Mr. Schwab introduced Mr. King as "the only American honorary vice-president this institute ever had."

The technical program ensued, and some of the papers read are abstracted in the current issue of THE IRON AGE.

The banquet, held in the Grand Ball Room Friday evening, was featured by addresses affirming the good will existing between the United States and Great Britain. Hon. Winstont Churchill, former British cabinet member, said that the rest of the world "is dependent almost entirely in the immediate future on the cooperation and development of the English-speaking countries." He committed himself to naval equality between Britain and America, saying: "We have pledged our hands and hearts that Britain and the United States shall be for all time equal upon the seas, albeit strong.

"We don't want all the good people in the world to disarm while the bad ones remain heavily equipped for war," he added. "You are the friends we would most like to see strongly armed."

Mr. Churchill paid tribute to President Schwab and to J. Leonard Replogle and Bernard M. Baruch, who were also at the speakers' table, for the services they rendered during the war. He recounted how in November, 1914, Mr. Schwab had agreed to build twenty submarines in nine months, when the shortest time in which submarines had been previously built was 19 months. When work on the vessels was stopped because of President Wilson's opposition to American manufacture of war equipment for either side in the war, the incompleted submarines were transferred to Canada, where 10 of them were put into commission within seven months after they were ordered.

John W. Davis, former American ambassador to the Court of St. James, and Democratic candidate for President in 1924, indorsed Mr. Churchill's pleas for amity.

"The note struck here tonight," he declared, "stirs my being more deeply than anything that can be said about foreign policy. We have no fixed conviction that runs so deep as our earnest desire to maintain friendship with our kinsmen across the sea."

American Enterprise Praised

An address was made by another distinguished British guest, Sir Frederick Mills, chairman of the Ebbw Vale Steel, Iron & Coal Co., Ltd., Ebbw Vale, Monmouth, England, and past president of the Iron and Steel Institute (British). He contrasted the unsolved difficulties under which the British iron and steel industry is laboring with the prosperity of American plants. He frankly stated that he had come to this country to find out how to make steel at a profit.

"It is no mean achievement to make more than half of the steel of the world," he asserted, "but it is more of an achievement to make it at a profit."

Sir Frederick commented on the readiness of American steel manufacturers to give him all the information he asked for, and recalled that more than 30 years ago he had heard Mr. Farrell tell the steel masters of Europe that it was to their self interest to cease quarreling and that they would gain the most by working together in the closest harmony on the basis of a "live and let live" policy.

Dr. Sperry Awarded Medal

All those who contributed technical papers in the day's program sat at the speakers' table and were introduced to the audience. Mr. Schwab announced that the institute's

medal for the best paper read at its meetings last year had been awarded to Dr. Elmer A. Sperry. As Dr. Sperry is enroute to Japan, the actual presentation of the medal will be deferred until his return, President Schwab added. The subject of the winning paper was "Non-Destructive Detection of Hidden Flaws" (THE IRON AGE, page 1214, Nov. 15, 1928).

The attendance at the banquet was 1837.

President Schwab Says Prospects Were Never Brighter

IN my long association with the steel industry I have never known it to enjoy a greater stability or more promising outlook than it does today. We are approaching the close of the best year the industry has ever experienced. It is estimated that the steel production for 1929 will exceed 57,000,000 tons. This is 10 per cent greater than it was in 1928, the best previous year. This high production establishes an important landmark but is by no means the most important or most significant aspect of the year in steel.

Gain in Stability and Balance

Greater output is, of course, gratifying to every steel man. As I view the industry, however, its most fundamental progress has been made this year in the degree of stability and balance which is now the outstanding characteristic of our business.

This fundamentally sound condition is largely responsible for the uniform prosperity which has been shared by all branches and all companies in the industry. It is significant that the industry's favorable showing has not been due to higher prices; our improved earnings are due to three factors: greater demand for steel, enlarged output and lower costs. There has been some slight increase in prices, but on the whole prices have been largely stabilized and held on an even keel. Here certainly is concrete evidence that when the whole steel industry within itself practices sound business principles, the resulting benefits are shared by every element in it.

No Big Inventories

Steel consumers as well as producers have benefited from this stability because it has enabled them to operate their own business on a firm non-speculative basis. Throughout the year sound buying methods have prevailed. Steel has been purchased for current consumption. No big inventories have been built up. At the moment there is a slight let-up in demand but we are in this fortunate position: that because prices are stabilized and contain no element of inflation there is no reason to give ground on prices whatever slight but inevitable fluctuations may occur in demand. In other words, it would be unfortunate if we were to let such fluctuations disturb the healthy balance which has been established.

Stability is the order of the day in every industry. Moreover, it is quite as ethical and necessary for the steel industry to think in terms of stabilized profits as it is to strive for stability in other respects. It is high time we scrapped the idea that the steel business must be either a prince or a pauper. Everyone recognizes that the ability of the steel industry to meet the greater demand for its products at lower costs has been helpful all around. It has benefited our customers and it has enabled us to make a better return on our investment than heretofore. There is absolutely no reason why this favorable situation cannot be maintained year in and year out even in times when business may not be as good as it has been right along.

Stability More Essential with Lessened Demand

This stability is beneficial not only during periods of greater demand; it is even more so in periods of lessened demand. We have all seen how lower costs have favorably affected earnings when we have a high output. We also know that if this demand falls off our costs are bound to increase, no matter what we may do. More than ever we need a stabilized price structure at such a time, for no industry can stand a double onslaught of high costs and lower prices and still make headway. So I repeat that it is fortunate that our present prices contain no element of inflation that will bear purging in the event of a lessened demand. In other words, let us continue to be profit-minded. Let us be mindful of our costs as well as volume in seeking to further stabilize the industry in every respect.

Since I have been your president I have given a great deal of thought to this problem. It seems to me that if we are to make our efforts permanently effective we must know and be able to evaluate the true economic facts of our business and have a complete understanding of their significance upon production and distribution. I am a firm believer that one of the best ways of assuring progress on an even keel is to let the cost sheet be our compass. The cost sheet will tell us whether productive capacity in any branch of the business is in excess of current requirements. It will reveal uneconomic and obsolete practices. It will forestall an unsound price structure. It will discourage the attempt to produce to capacity all the time, regardless of demand.

It is time to discard the idea that costs are not important in determining sales policies because the latter are fixed by competitive prices. The fact is that competitive prices frequently fail to yield a proper return because they do not give adequate consideration to costs.

Two Reasons for Increased Steel Consumption

If we analyze steel's accelerated consumption we find it is due to two outstanding reasons: First, the extension and replacement of steel in its traditional fields, such as building, automobiles, railroads, highways, bridges, pipe lines, etc., and, second, the growing demand for steel for new uses.

The replacement factor alone provides a huge annual backlog for our business. You would be astounded if we were to compile figures to show the amount of steel that is used recurrently every year for replacements and extensions. I dare say that this field alone accounts for an enormous part of present day production. For instance, just as the replacement factor in the automobile industry is increasing in importance as more automobiles are put into service, so it is with steel—the more steel that goes into service the greater becomes the demand for its replacement and recurrent use. Fortified with this constant demand and the new uses to which steel is being put for things that are new, the industry occupies indeed an impregnable position as a basic necessity to our national growth.

Machine Not Causing Unemployment

Of course, underlying all other considerations, it is upon the prosperous condition of our people generally that the future of steel and every other industry depends. Under present-day living standards where one want makes way for another, high and sustained purchasing power is essential. It is highly gratifying, therefore, that labor generally is enjoying good wages, a surplus of which is finding its way into saving accounts and other fields of sound investment.

Labor as a whole is quite fully employed today. The mechanization of industry has resulted not only in light-

ening the load of the worker and affording him more leisure, but this same development has created many new jobs. You will find that the percentage of the population gainfully employed is probably as great as it has been at any time in the last decade. Certainly this would not be true if the development of the machine were creating fewer instead of greater opportunities for gainful employment.

If the equilibrium between production and consumption is maintained, there is no reason, in my opinion, why our present prosperity should not continue indefinitely. Fundamentally there is every reason why the use of steel will increase. The per capita consumption is growing rapidly —steel finding its way into many new fields and, through its adaptability, economy and its elemental security, is supplying a service which no other metal can perform.

No Grounds for Pessimism, Says James A. Farrell

THERE is a good deal of pessimism around at the present time; it affects some people more than others. I cannot see where it affects the steel business at the present time. With the exception of one or two of our commodities we are just as busy as we were; the prospects are just as good as they were, and I think that we are going to have a continuance of the present business. I think business is good when we can operate our plants 75 or 80 per cent. With the capacity which existed a year ago, we would be running about 110 per cent now. But, of course, we kept up with the demand; we have gone on expanding to meet the necessities of the country, and these necessities are increasing all the time.

Some Lines Even Better Than Six Months Ago

There are some lines of business which are even better than they were six months ago. I do not believe that there is a fabricating shop in the country today that is not booked up for the next four or five months.

As Mr. Grace said yesterday in his report to his stockholders, the shipbuilding business has not been as good in 15 years as it is at the present time. The shipbuilding yards on the Atlantic Coast, and they are all large yards, have sufficient work at the present time for six months, and there has certainly appeared a demand for new vessels.

Cupidity Is Greatest Danger

I think that Mr. Schwab has laid down principles which were more or less known to us, but it is like a great many other rules and regulations, they are more observed in the breach than otherwise. Now if the people in the steel industry cannot maintain their equilibrium, why we won't have a good business, because the cupidity of people is ever with us, and when somebody thinks he can take business that belongs to somebody else the natural result is that somebody else is going to take something that does not belong to him. That is the main trouble with our industry. You cannot sell seven tons of steel to a man that only wants to buy one, and if somebody sells that one there is no reason why the other six should go around and spoil the bargain or the sale.

No New Tricks in the Game

Now, this whole situation is in our hands, and I have not found anybody in the steel business that is any smarter than anybody else, and there are no new tricks in the game (laughter). Now, with the standard that has been laid down by Mr. Schwab, assuming that he speaks for his own company, which I know that he does, I will guarantee, as far as the United States Steel Corporation is concerned, that there will be no complaint about their ethics in business. You know this word "ethics" has become a very popular word, and "trade practices." I am not going to detain you any longer. There is a great deal of information which is more or less hermetically sealed inside of my anatomy, but I think I had better keep some of it there for the moment; but, if we fail at this juncture and violate the golden rule as between men and as between companies, then we can blame ourselves for anything that happens that will make the situation any different from what it is at the present time.

Steel's Growing Service to Civilization

BY E. F. KENNEY*

IT is estimated that the nation will consume more than half a ton of steel this year for every inhabitant. Without steel there would be practically no transportation by land, water or air. The generation of power, as we know it, or the application of power to perform useful work, would be impossible.

Non-ferrous metals have played a most important part in the development of civilization. But more than 21 times as much steel is produced in the United States as the combined consumption of copper, lead, zinc, aluminum and tin.

Railroads are pressing for stronger and safer rails and wheels to carry the heavier loads. For a number of years they have tried to meet the issue by increasing the weight of the rail and the carbon content. Today it is realized that the limit has been reached in carbon content, and that, unless the physical properties of steel are increased, the heavier and more massive rails will be no more resistant to wear than the lighter ones. Alloys have been tried, without much success. Heat treatment has been resorted to, and appears to be more promising than any other remedy so far tried. But the future development of heat treatment depends on the economic necessity of greater wheel pressures and speeds to carry the increasing traffic.

Great Bridges of Steel

Spans of structural steel up to 500 ft., capable of carrying the heaviest loads, are not unusual. But the spanning of clear openings of extreme width has not been common in the past, and recent performances are striking. The largest completed to date is the Delaware River Bridge at Philadelphia. It has a clear span of 1750 ft., and carries six lines of automobile traffic, rapid transit and surface car tracks, as well as pedestrians. The entire load is supported by two cables, each made up of 18,666 steel wires having a total tensile strength of 59,000 tons. The work of constructing the cable, placing each of the 18,000 wires so that it will take its proportionate part of the load, and compacting the wires and protecting the cable, calls for the greatest skill and precision.

This bridge, great as it is, will be completely overshadowed by another bridge of similar character now being

*Metallurgical engineer, Bethlehem Steel Co., Bethlehem, Pa.

erected over the Hudson River at New York. Here the clear span is doubled to 3500 ft., or two-thirds of a mile, and four cables are used. These are similar to those in the Delaware River Bridge, but are larger, each having a total strength of 100,000 tons.

It is characteristic of the engineering strides being made in steel construction and significant of its future that within a period of five years the gap that we can span has doubled in breadth.

Buildings of Ever-Increasing Height

Spectacular development of large bridges is paralleled by the tall buildings in the congested metropolitan districts. The latest and greatest is the 80-story Empire State Building, to be erected on the site of the Waldorf-Astoria Hotel, New York. This building will be nearly 1000 ft. high and will house 50,000 persons.

Like a number of its neighbors, it is composed of a heavy steel framework carrying the masonry exterior which beautifies and protects the steel structure. It has been shown by the dismantling of Madison Square Garden and other older buildings that masonry covering is a complete protection against atmospheric corrosion of the steel frame. Experience, as far as available, indicates that such steel construction is the safest known for resisting wind, earthquake, fire or overloading.

Automotive Steels Demand Highest Qualities

Sometimes the demands for perfection in automobile steels seemed unreasonable. Trying to meet them was very hard; it was often discouraging, but it had its reward. Today the automobile is the greatest of all users of steel. In five years its requirements of steel have increased from 3,500,000 tons to 6,700,000 tons annually. There are more than 24,000,000 automobiles in general service in the United States; this year more than 5,000,000 will be built.

Because of the use of lighter materials in the construction of airplanes and airships, one does not immediately think of steel as a great necessity in their development. Yet the steel cylinders and other engine parts require the greatest perfection in the steel maker's art and without them the conquest of the air could never have been attained. A British seaplane recently averaged 355.8 miles an hour.

This required engines not only of tremendous power, but also of extremely light weight. To develop one horsepower for each 1½ lb. of engine weight means that every part is reduced to the lowest possible size, and that the steel composing these light high-speed rods and shafts must be not merely extremely strong, but must be perfect. Failure is fatal; no imperfection can be tolerated.

Enhanced Agricultural Productivity from Steel Uses

Seventy-five years ago two-thirds of the population lived in the country. Today only 43 per cent are rural dwellers. For purposes of comparison we may say that in the earlier period 10 farmers provided food for themselves and five city dwellers. Today 10 farmers provide for themselves and 13 city dwellers. The increase in productivity is due to steel. The power tractor, the multiple plow, and the many farm implements for tilling the soil and gathering the harvest, as well as the rail, water and automotive transportation utilized to conserve time and broaden markets, are possible because of steel.

In the petroleum industry, in the cracking processes by which the heavier oils are decomposed to produce gasoline, pressures up to 800 lb. with temperatures to 900 deg. Fahr. are not uncommon. One large company has inquired for an experimental oil refining plant to use a maximum pressure of 2200 lb. and a maximum temperature of 1500 deg. Fahr. The high pressures would not involve great difficulty, but the use of high temperatures, at which all of the commonly used steels are materially softened and weakened, presents a staggering problem. As practically all of our manufacturing processes involve softening by heat to facilitate working, it is evident what difficulties are to be overcome if the material which is required must have the property of not softening on heating.

American Leadership Secure

Our own country produces now one-half of the world's steel supply. We have in our grasp a commercial leadership that must encourage us to the utmost effort to further the use of steel by careful manufacture and patient research. Steel today is far in the lead of other metals, both in adapting itself to the manifold new requirements of a changing world, and in the creation of new uses through research.

In the social, economic and political life of man, steel has made contributions without which the inhabited globe would be another, and far more primitive, place to live in. The service of steel to civilization is greater now than ever before. The pride of superior service and a spirit of scientific inquiry will carry steel to heights of usefulness of which as yet we can only dream.

What Steel Has Done for Humanity

MAN'S capacity to cooperate with others for the benefit of the human race, said Charles P. Perin of Perin & Marshall, New York, has shown its result in what steel has done for humanity. Steel is needed largely for transmission of energy and for vessels to transport food and other products. At the world's present rate of production of approximately 100,000,000 tons a year, the known reserves of iron ore will either have been completely depleted by the year 2000 or so highly impaired that we shall need a very great use of methods of beneficiation and a much more efficient use of the material itself. The present large proportion of scrap used in making steel is a great benefit in conserving ore.

Highly important for the future is the increasing use of rust-resisting products. Corrosion has been estimated to cause the discarding of from 19,000,000 to 31,000,000 tons of steel annually. However, the price at which alloy steel can profitably be sold must come down decidedly if enough of it is to come into use to cut down much waste from this source.

It might be mentioned in passing that the estimated reserves of ore in Cuba, amounting to 4,000,000,000 tons, account for some 80,000,000 tons of chromium and 40,000,000 tons of nickel, on the basis of 2 per cent of the former and 1 per cent of the latter. If these elements could be dissociated from their surroundings at a low enough price, this might point the way to much rust-resisting steel in the future.

Romantic Is the Story of Steel

Fairly romantic is the story of the increasing penetration of the universal metal into the life of our time, said Alvin I. Findley, editor THE IRON AGE, New York. Only a few years ago a per capita consumption of 500 lb. a year in the United States was pointed to as a mark to be aimed at; but only so confirmed an optimist as Mr. Schwab would predict its early realization.

Yet, difficult as we find it to account for the performance of this amazing year 1929, on the heels of the remarkable record of 1928, our use of steel this year will represent no less than half a ton for every man, woman and child. We are finding each year that the important outlets which we are able to check fairly well—automobiles, railroads and new construction—fall farther short of accounting for our increased production, and that much of it is due to the multitude of new forms in which steel is entering into everyday life.

The paper gives us a distinct impression of the steady

pushing up of the demands of modern engineering upon the steel maker and the more than adequate response of the industry. Illustrating how fast we are moving are two items made public since the paper was put in print. One is a contract made by a Detroit automobile company for record-size steam generating units that will use steam at 1350 lb. pressure, against the 1200 lb. mentioned. The other is the announcement of plans for a 100-story building in New York, coming while wonder was still new over the 80-story Empire State Building referred to.

The author has well summarized the situation in respect to steel rails. There may be dissent from his reference here to alloy steel, and the difference may be partly one of definition, seeing that the steel rail statistics of the institute do not classify as alloy steel the considerable rollings in recent years of rails carrying an extra content of manganese. Cost will be an important factor, but a further development of the alloy steel rail would seem likely if service demands continue to increase.

Highly interesting are the references to steel as a factor in airplane and airship construction. It may be added that chromium-molybdenum steel tubing is now standard construction for airplane fuselages and that, while most of the dirigibles have duralumin skeletons, the great British R-101 has stainless steel tubing in all main members.

Nothing in his paper is of more moment to the industry today than Mr. Kenney's references to the part research must play in making a product that will meet all the new requirements of a fast changing world, and in creating new uses for steel. In the minds of our European competitors American steel making has long been synonymous with tonnage. Sometimes they have even hinted that we sought volume at the expense of quality.

If they have been alive to what has taken place, especially in the past four or five years, they have learned that research for the betterment of the product and the enlargement of its place in modern life has engaged our steel makers as never before. Steel that will resist corrosion, steel that will carry heavier loads with lighter section, steel that will withstand high temperatures, steel that will meet the present-day demand for speed of transportation by water, by land or by air—these are the main objectives of fourfold more investigators than were similarly engaged as the century opened.

The paper before us is entirely within bounds in its prophecy of the greater achievements of the industry in providing steel of better quality and wider variety of form. Not only may we look confidently to the steel of tomorrow to add vastly to the satisfactions of human life, but to aid largely in making it possible for the average man to maintain life on a high level by working but 40 hr. out of nature's weekly allowance of 168.

Fatigue of Metals—A Review

BY H. F. MOORE

IN the ten years which have elapsed since Professor Moore last addressed the Institute there has been one outstanding achievement of research on fatigue of metals: It has been definitely proved that metal actually has an endurance limit. About a dozen different steel test specimens have survived a billion reversals of stress without fracture; one is unbroken after 10 billion. Generally speaking, the more ductile metals must be operated to a very high number of cycles to determine precisely the endurance limit, and duralumin constitutes the only doubtful exception to the first statement (although work on this alloy is still in progress).

Professor Moore's paper contains illustrations of a wide variety of fatigue testing machines. (In passing it might be mentioned that he favors the term "failure from progressive fracture" to the term "failure from fatigue.") Some of them are designed to stress the specimen in direct tension and compression, in order to avoid the concentration of stresses existing in a rotating beam, but the uniformity of stress across a tension specimen is said to be illusive—differences of 10 per cent can be found by mounting extensometers at different places on a tension specimen mounted in the best of approved grips.

Short-time tests were also discussed. Experiments at loads which cause breakdown in a short time are of no value, for the ability to stand excessive punishment is related to the ductility of the metal, whereas the true endurance limit is a function of the ultimate strength or the hardness, as shown by the curve. Other than inferring the value from a tensile test, the only rapid method of promise was described in THE IRON AGE, June 6, page 1572, and depends upon finding the first microscopic flaw to open up, under gradually increasing loads, by measuring the electrical conductivity of the specimen. Professor Moore has tested this method, using four steels and four nonferrous alloys, and finds it to give results which closely approximate those of more tedious methods.

GRADUATED from New Hampshire College in 1898, H. F. Moore received his degree of doctor of science in 1922. He was instructor in machine design at Cornell University, 1900 to 1903. From 1904 to 1907 he was assistant professor of mechanics, University of Wisconsin. He has been professor of engineering materials at the University of Illinois since 1907. He is author of "The Materials of Engineering." He has served the American Society for Testing Materials as president.

Theory of Fatigue Still Doubtful

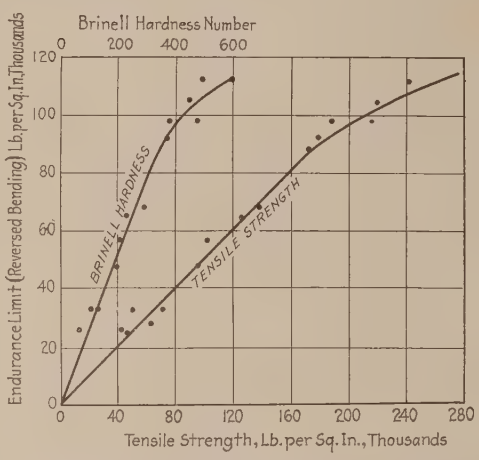
A comprehensive theory for the phenomena of failure from progressive fracture is not yet formulated. It must harmonize such curious facts as (a) understressing increases the endurance limit, even as much as 30 per cent, but this figure varies for different materials; (b) overstressing decreases the endurance limit; (c) the surface condition, such as polish, has a great effect on the result; (d) a Vee notch with bottom radius of 0.005 in. reduces the endurance by two-thirds; (e) running the sample in fresh water reduces the endurance limit as much as 50 per cent, and removes whatever advantage heat treatment may give to a specimen when run dry; (f) while the endurance limit of most metals is below their elastic limit, this is not true for annealed iron or copper.

It is believed, however, that a failure from progressive fracture cannot occur unless the stress on the entire piece is sufficient to *start* the fracture at some point where stresses are concentrated by a flaw existing in the metal, or induced by corrosion on the surface. Homogeneity is therefore to be striven for in the production of metal for

high endurance. Furthermore, there is no special alloy steel which has unusual virtue, except as it may be successfully and uniformly heat treated in a commercial way to a high ultimate strength, because laboratory treated carbon steels give just as high endurance limits as the best alloys.

Some tests made at elevated temperature suggest to Professor Moore that, at temperatures of 1000 deg. Fahr. or above, the endurance limit will probably be above the limiting stress from creep or plastic deformation.

In conclusion, the speaker gave it as his opinion that three-quarters of the fatigue failures in service were due



Endurance Limit of Metal May Be Inferred from Its Hardness or Ultimate Strength by Using the Above Curves

to faulty design or surface corrosion, rather than to poor materials.

Practical Use of Endurance Data

In discussing the paper, J. A. Capp, engineer Testing Laboratory, General Electric Co., Schenectady, N. Y., described some efforts he had made to interpret the static and endurance tests of metal to designers in his organization. He emphasized that engineering formulæ are based on the supposition of homogeneous materials acting within the elastic limit, whereas steel and in fact all metallic alloys are random crystalline aggregates shot full of non-metallic inclusions and probably sub-microscopic voids. Nevertheless the static or slow-moving tests, as of tension, torsion or hardness, give statistical results, integrating all the irregularities of stress distribution and elastic movement within the specimen. The fundamental difference of the alternating endurance test is that it searches out the weakest spot—this spot is what initiates the crack which ultimately spreads across sounder metal to complete fracture. It is a microscopic test of the finest details of structure, rather than an averaging of the strong with the weak.

F. N. Speller, director department of metallurgy and research, National Tube Co., Pittsburgh, pointed out the similarity of the harmful effect on the endurance limit of tiny notches and of surface corrosion; the latter is due to non-uniformity and the familiar pitting action merely produces damaging notches. Unfortunately, alternating stress apparently increases the corrosion rate greatly at these random centers. Experiments in his laboratory indicate that the bad effects of tap water corrosion may be entirely counteracted by greasing the specimen or by a small percentage of an inhibitor, such as sodium chromate, dissolved in the water; but this is effective only as long as the inhibitor is used. It has also been found that the rate at which the stresses alternate has a great effect upon the damage done by corrosion fatigue. Thus, a corroding specimen, run slowly, may actually have a long life in hours.

Short time tests were also discussed by Dr. H. W. Gillette, director Batelle Memorial Institute, Columbus, Ohio. He observed that time could be saved by speeding up the reversals to the condition where the specimen is a vibrating reed. Jenkin, in England, has in this manner achieved as many as 10,000,000 reversals of stress in 15 min.; his results (which may be in error as to the maximum stress) do not check those found by the relatively slow rotating beams. Similar work on very high frequency alternations at the United States Bureau of Standards do not seem to agree with Jenkin's work, and the whole question requires further study. Other investigations must also be made on large specimens—like a full-sized axle—and on refrigerated metal, at temperatures met in severe winters or by flyers at high altitudes.

Detecting Sulphide Areas in the Presence of Phosphides

THE original method of Heyn and Bauer for detecting sulphides and phosphides depends on the difference in color of the sulphide and phosphide of mercury. When a polished section is etched with an acid solution of mercuric chloride, the sulphide areas appear black, while the phosphides are colored a lemon-yellow.

However, according to M. Niessner, in *Stahl und Eisen*, the sulphide reaction, in the presence of a large quantity of mercury salts, and a deficiency of hydrogen sulphide, yields the so-called sulpho-salts, which are white to yellow in color. In order to prevent erroneous interpretation of the etching figures, therefore, some further test was necessary, and has been developed.

It was found that a solution containing iodine and sodium azide reacts with sulphides, evolving nitrogen gas. In making the test, gelatin paper is first soaked with the acid mercuric chloride and placed upon the sample. After four to five minutes it is removed and dried. Dark areas represent sulphides. Yellow areas are tested by dropping upon them a little of the azide solution. In the case of sulphides a visible evolution of gas takes place. Absence of gas indicates a phosphide area.

The azide solution is approximately one-tenth normal in iodine and one-fifth normal in sodium azide (NaN_3).

The behavior of binary alloys is affected by the presence of relatively very small quantities of impurities. In more than one instance it has been found that less than 0.1 per cent is sufficient to produce serious modifications in the apparent equilibrium diagrams obtained. A striking example occurs in the case of the alloys of aluminum and zinc. Certain of these alloys containing about 78 per cent of zinc, after quenching at a suitable temperature, undergo a spontaneous hardening, followed by spontaneous softening accompanied by the evolution of a considerable amount of heat. In the course of the investigations of Hanson and Gayler in England, zinc and aluminum of the highest available purity were utilized, and the phenomena in question made themselves very strongly evident. If, however, alloys of this type are made up of commercial zinc with a small content of lead, the whole of these phenomena are either suppressed or rendered very feeble. In the same way, it has recently been discovered that small amounts of impurity in iron materially affect the position of the critical transformation temperatures, and it has even been suggested that in entirely pure iron the so-called allotropic transformations would not occur at all.

Gear Makers Meet in Philadelphia

Discussions Include Market Analysis, High-Strength Cast Iron, Tungsten Carbide Tools and Technical Standards

IMPORTANT problems bearing directly on gear manufacture and marketing were discussed at the semi-annual meeting of the American Gear Manufacturers Association, held at the Benjamin Franklin Hotel, Philadelphia, Oct. 24, 25 and 26.

High-strength cast iron, tungsten carbide cutting tools, and a recently started investigation of worm gear drives were among the topics featured. There were also addresses dealing with a method of analyzing the market for gears, and the rôle of the trade association in industrial standardization.

Progress reports were submitted by 12 sub-committees of the association's general standardization committee, which is headed by B. F. Waterman, engineer, Brown & Sharpe Mfg. Co. One recommended practice, for herringbone gears, was accepted. Renewed activity in the association's commercial standardization work is indicated by the appointment of a new committee with F. W. Sinram, president, Gears & Forgings, Inc., Cleveland, chairman. A. F. Cooke, vice-president, Gears & Forgings, Inc., and president of the association, presided at all sessions.

Two companies were elected to membership. They were the Massachusetts Gear & Tool Co., Woburn, Mass., with E. R. Lyman, president, as executive representative, and the Atlantic Gear Works, Brooklyn, N. Y., George Scherr, executive representative.

Members and guests of the association were luncheon guests of the Philadelphia Gear Works, Oct. 25, at the Benjamin Franklin Hotel. The Hon. Harry A. Mackey, mayor of Philadelphia, was the principal speaker, and was introduced by G. L. Markland, Jr., chairman of the board of the Philadelphia Gear Works.

Hugo Bilgram, president of the Bilgram Machine Works, Philadelphia, widely known for his contributions to the art of gear cutting, was a speaker at the opening session. His outline of the invention of his bevel gear shaper in 1874 and 1875 and of other mechanical inventions was received with interest.

The spring meeting of the association will be held next May in Cincinnati, the dates to be announced later.

Gear Standardization Makes Progress

A RECOMMENDED design practice for herringbone gears, submitted by A. A. Ross, engineer metal gear department General Electric Co., West Lynn, Mass., and chairman of the herringbone gear committee, was accepted. This practice sets maximum and minimum values for such factors as pressure angle, helix angle, etc., instead of offering at present a definite single standard for all factors.

The metallurgical committee, the chairman of which is C. B. Hamilton, Jr., president of the Hamilton Gear & Machine Co., Toronto, Canada, has been working with sub-committee No. 8 of the sectional committee on the comments received since the broadcasting of proofs of the recommended practice for forged and rolled alloy steel for gears.

Use of a non-resonant railway gear is to be suggested at the next meeting by the electric railway, mill and mine gears and pinions committee, which is headed by L. F. Burnham, manager of engineering Nuttall works of the Westinghouse Electric & Mfg. Co. "The non-resonant gear," it was explained, "is one which has its high-pitched operating notes, due to vibrations caused by tooth interference and impact, deadened by the use of an attached body in intimate contact with the gear itself."

The worm gear committee, with W. H. Himes, mechanical engineer Westinghouse Electric & Mfg. Co., chairman, presented for discussion some 15 changes in the worm gear nomenclature submitted to the association at its meeting last Spring. This part of the committee's work is now before the A. G. M. A. nomenclature committee. A series of tests which may later develop into a recommended practice is contemplated by the worm gear committee.

The work of the bevel and spiral bevel gear committee, headed by F. E. McMullen, Gleason Works, Rochester, N. Y., is at a halting point pending review of its report on nomenclature by the association's nomenclature committee. It is planned to work up data on loads for bevel gears.

The nomenclature committee plans to submit at the next meeting four different nomenclature reports which will include definitions, sketches, etc. The columns in the nomenclature designated as "symbols" will be changed to "abbreviations." D. T. Hamilton, Fellows Gear Shaper Co., is chairman of the committee.

Progress was reported by the spur gear committee in its work on horsepower tables. The tables so far worked out are to be reduced in size. J. L. Williamson, Fellows Gear Shaper Co., Springfield, Vt., is chairman of this committee.

H. R. Moyer, Westinghouse Electric & Mfg. Co., has been appointed chairman of the non-metallic-gearing committee to succeed T. C. Roantree of the Westinghouse company, who is engaged in other work.

A number of changes in the roller chain and sprocket recommended practice adopted by the association in 1925 are contemplated by the A. G. M. A. sprocket committee and other cooperating committees of the A. S. A. G. M. Bartlett, consulting engineer, Diamond Chain & Mfg. Co., Indianapolis, is chairman of the A. G. M. A. committee.

A new series of chains with pitches from ¾ to 3 in. are recognized; these have the same proportions as the standard series but have thicker sideplates and are to be known as the extra-heavy series. The formula for minimum breaking strength included in the recommended practice is abolished. A light weight machinery chain, to be designated as the No. 41, is recognized as standard. Its pitch is ½ in., width ¼ in. and roller diameter 0.306 in. Limiting tolerances, maximum and minimum, for chain parts, within which it is necessary to keep in order to assure interchangeability between connecting links as produced by different makers of chain are included in the committee's recommendations. Supplementary information includes recommended chain working loads, maximum sprocket speeds, and metal pattern teeth for cast sprockets.

H. J. Eberhardt, secretary Newark Gear Cutting Machine Co., Newark, N. J., in reporting for the tooth form committee, read a communication from Prof. U. Holland of the University of Pennsylvania, asking for information relating to the tooth

form standards promulgated by the A. G. M. A. The committee's reply to this letter contains an interesting elaboration of some of the details of these standards, and will be included in a later issue of THE IRON AGE.

C. B. LePage, assistant secretary of the American Society of Mechanical Engineers, outlined the status of the work of the 10 sub-committees of the sectional committee on the standardization of gears.

Role of the Trade Association in Standardization

AS heretofore at the fall meetings an evening was set aside for a technical standards meeting, at which the 12 or more technical sub-committees get together to formulate plans for the winter months. Immediately preceding these group meetings, Dr. P. G. Agnew, secretary of the American Standards Association, New York, addressed the association on "The Role of the Trade Association in Industrial Standardization."

A large number of trade associations make standardization one of their principal activities, and at present more than 200 trade associations are officially cooperating in the work of the A. S. A., said Dr. Agnew.

The organized standardization movement, so far as it has been developed, largely begins and ends (in the use of standards) in the individual company. "Company executives should be alive to the economic importance of the movement and in sympathy with it. Instead of leaving their standardization work as a more or less incidental and somewhat unconscious function of the engineering and production departments, industrial executives are more and more providing a definite organization through which the standardization activities of the company are carried out," he said. "While steady progress is being made, we are still far behind Germany in the matter. There, more than 1000 firms have a special organization for carrying on this work; in all of the great companies the standards department reports directly to the general management."

In discussing the function of the trade association in the standardization movement, Dr. Agnew pointed out that one of the educational functions of the association should be to bring home to the executives of its member companies the economic importance of standardization and its significance as a management tool.

The attempt to control a standardization project entirely within the association, when other groups have an important stake in the project, was said to be an error frequently made, especially by the less experienced associations. "The number of standardization undertakings sufficiently narrow in scope to be properly handled without the cooperation of other groups is very much smaller than is generally realized," he said. "Too often there is also the attempt to leave competent consuming groups entirely out of the picture."

It was emphasized that the trade association should require responsible representation on the part of its members on committees dealing with standards. The meaning of representation and of the responsibilities it entails is not always understood, said Dr. Agnew. "In committee work the A. S. A. has so frequently found it necessary to call the importance of this matter to the attention of cooperating bodies and their representatives that it has formulated the following for use in such cases: It is the duty of a representative 'to keep sufficiently in touch with his organization so that he can correctly interpret its attitude in the development of the work and in participating in decisions in the sectional committee; to keep his organization informed of developments; to act as a leader in the formulation of the policies of the organization in regard to the matters with which he is dealing; and to refer back to his organization questions upon which he feels unauthorized to speak for it.'"

Another essential function of the association in the standardization movement was said to be the systematic promotion of the use both of its own standards and of those national standards in whose formation it has taken part. "One of the easiest ways of accomplishing this is by stimulating systematic references to such standards in catalogs, in advertisements, etc. Surveys by the association of the extent of the use of its standards is a most effective means to this end," said Dr. Agnew.

New Commercial Standards Committee

PROJECTS to be undertaken by the new commercial standardization committee include revision of some of the items of the proposal form that was recommended as standard practice by the association some years ago. It is also planned to gather periodical trade statistics, including orders and billings, that will serve as an index to aggregate business conditions in the industry. In addition to F. W. Sinram, chairman, members of the committee are: S. L. Nicholson, assistant to the vice-president of the Westinghouse Electric & Mfg. Co., New York; A. R. Ford, president Frost Gear & Forge Co., Jackson, Mich.; Howard Dingle, president Cleveland Worm & Gear Co., Cleveland; and R. C. Ball, president Philadelphia Gear Works.

In an address on the "Market for Gears," W. E. Kennedy, sales manager, *American Machinist*, New York, effectively illustrated a method of market analysis and planned selling as applied to the gear industry. In all lines, the market for gears is expanding, due to the increase in machinery production, he said.

The intensive cultivation of local or neighborhood markets, because of the advantage of shipping rates, closer contact with buyers and their needs, was stressed. Small or single gear orders were in many cases taken at a loss, he said. The percentage of such orders is frequently much larger than realized, and proper analysis of sales would lead to greater effort in obtaining the more profitable type of business.

Investigating Worm Gear Drives

THE equipment and methods of a recently begun investigation of worm gear drives were outlined in a paper by Emil Dukes, Gears & Forgings, Inc., Cleveland, on "Load and Speed Conditions of Worm Gear Drives." The object of the tests, which are being conducted at the Case School of Applied Science, Cleveland, is to determine a reliable method of calculating worm gearing.

"The method used at present is rather vague," said Mr. Dukes. "The load per sq. in. of projected area of one tooth is calculated, and this multiplied by the pitch velocity of the worm gives a factor called pv. The value of this factor determines whether a certain worm and gear combination is adapted for the work in question. It is left to the experience and judgment of the designing engineer what value of pv will be acceptable in each case.

"This method obviously is not scientific and does not correspond to the actual facts. The value of p, the pressure per sq. in. of projected area, while proportional in a degree to the actual bearing area, which is a secondary curve resembling the ellipse, does not take into consideration the number of teeth in contact. The larger the number of teeth in contact for the same pitch, the larger the bearing area produced by the elastic deformation of the materials under load.

"All calculations will be based on this actual bearing area. Instead of p being the tooth load divided by the area, it will be figured as the maximum specific pressure existing between two cylinders in contact under pressure. For this purpose we will use the Hertz equation.

"The factor v also is used without discrimination. The permissible pv which we hope to arrive at will take into consideration whether the worm has a single thread or multiple threads."

The test apparatus includes a 30-hp. Sprague dynamometer, which is coupled to the worm shaft by a Franke coupling, and a Prony brake. A platform scale is used for measuring the Prony brake load, and a revolution counter for getting the speed. Temperature measurements were made by iron-constantan standardized wire thermocouples, with a Leeds

& Northrup potentiometer. Four couples were used, at the worm, the case, the thrust bearing carried and the oil sump.

It is expected that the tests will require a period from 6 to 12 months; results will be given in papers at subsequent meetings.

Tungsten-Carbide Tools Most Remunerative on Production Jobs

"IT may now be said without fear of successful contradiction that cemented tungsten-carbide tools are here to stay and that they will fill an even more important place in our industrial life than was evident a year ago" said Dr. Samuel W. Hoyt research laboratories, General Electric Co., Schenectady, in an address on "Tungsten Carbide Tools" at the second general session, Oct. 24, of the gear association meeting.

"In many instances it has been the spectacular performances which have attracted attention," he said. "They merit all the attention they have received, but it has already become clear that the new tools find their most remunerative work on the much more prosaic 'production' jobs. It is by doing the large scale production jobs that these tools have won their place. They have demonstrated their ability to take their place 'in the line' on a truly commercial basis, and the results, measured in terms of increased production and reduced costs, and in terms of thousands of tools and hundreds of thousands of parts produced, speak more eloquently than words for the place cemented tungsten carbide has already attained."

Effects of Cobalt Content

In describing the nature of cemented tungsten carbide and its manufacture, Dr. Hoyt said, in part: "While the function of the cobalt is to cement the particles of tungsten carbide together, it is also true that the amount of cobalt used affects the hardness and strength of the mixture. Thus greatest hardness and least strength are obtained with low cobalt, or of the order of 5 per cent, while much greater strength and toughness and somewhat lower hardness are secured with higher cobalt, or of the order of 15 per cent. Cobalt contents of 20 per cent and above have been found to be too soft, or to wear too rapidly, for use as a cutting tool."

The various methods of "tipping" tungsten carbide to the steel shank of the tool were outlined. The most common method is by copper brazing.

"For this method the shank is first milled out to receive the tip, and here a fairly good fit is desirable, for the better the fit, the better and stronger the joint," said Dr. Hoyt. "The brazing is done in an electric furnace in an atmosphere of hydrogen, according to the usual technique. Later it was found that the carbide tip may be fastened on by welding the tip and shank around the contact between the two. The shank is first beveled at the margin and the space left filled in with a welding rod and the atomic hydrogen flame. This is particularly well adapted for use in a shop. Tools have also been made by uniting the tip and shank by the special cements made for uniting high speed steel tips to a steel shank.

"It has been found that tungsten carbide tips which are rigidly welded to the shank are only too apt to come off, either directly after the tool is made, or after being put in service. This is due to thermal stresses which are set up by temperature changes and differences in the coefficients of expansion of the carbide and the steel. This circumstance accounts for the popularity of copper brazing, because here the thin layer of copper affords a soft cushion which absorbs such stresses without transmitting them to the carbide tip. On the other hand, copper softens at elevated temperatures, so that it is necessary, in the design of the tool, to remove the joint far enough away from the cutting edge so that it does not get dangerously hot during operation. The 'welded' tool loses less strength at high temperatures and hence can be made smaller for a given job."

It was pointed out that at the start of the work on tungsten carbide tools, the grinding of the tools presented new and unique problems, which, however, have been solved. Silicon carbide wheels are used, coarse grinding being done on a wheel of grade 60, while for fine grinding wheels of grade 100 to 120 or even 200 are employed. The pressure on the wheel should be light and grinding should be away from the cutting edge to avoid chipping. For tools used for fine finishing work, the edge is frequently lapped with boron carbide or diamond dust. It was stated that by this means the tool can be given a very good edge and, if necessary, can be brought to size within a tenth of a mil. The lapped edge is found to have considerably longer life on such operations than the edge produced by grinding.

Cutting Angles Differ from Those of Steel Tools

In regard to the clearance angles of the tool and the shape of the cutting contour, it was pointed out that those best suited to tungsten-carbide tools differ from those which are used with high-speed steel. "With this tool design the cutting edge is given the maximum support commensurate with the cutting requirements of the material being machined, while the stresses imposed by the chip are properly taken up by and transmitted to the shank," said Dr. Hoyt. "Both Friedrich Krupp and the Carboloy Co. adhere to these general principles although they differ in some details. In all cases the specific application should be considered on account of the variation of these factors from case to case.

"In general, we may say that the top side rake of a simple turning tool for steel is made 12 to 14 deg., or 4 to 6 deg. less than is common with high-speed steel. The front and side clearance angles are made from 3 to 6 deg. If the tool is always set at center, or below, the smaller angle can be used to get the greater support. Perhaps the most unusual feature is the 0 deg. or even negative back rake which is so common. Another feature is the radius that is ground on the upper surface which curls the chip and increases the life of the tool. The body angle of the cutting edge is increased as the strength of the steel being machined increases.

"The cutting angles for cast iron are not greatly different from those used for steel, for general purposes. In this way advantage is taken of the keener cutting edge, a factor which will become more and more important as the speed of machining is increased.

"Non-ferrous metals require, again, different angles. Here it is customary to grind the tool with more of a "hook" by increasing the side rake and by adding a back rake which may be as great as 14 deg. Within the limits of this discussion, the same may be said of the non-metallics like Bakelite, hard rubber, etc."

High Cutting Efficiency May Be Utilized in Three Ways

To illustrate the significance of this new tool material when properly applied, some of the accomplishments in the field of machining metals were cited.

"The outstanding characteristic of cemented tungsten carbide is its high cutting efficiency," said Dr. Hoyt. "This cutting efficiency can be utilized in machine shop practice in three ways, to secure greater tool life with about the same speeds, feeds, etc.; to secure higher cutting speeds; or to machine materials which have been classed as non-machinable. A good example of what can be accomplished along the first line is furnished by automatic screw machine work. Here the feeds are light and the speeds high, while the time involved in setting up the various tools to get the accuracy required in this work becomes an important factor in the cost of doing the operation."

Use of the tungsten carbide tools for general turning work in the general automatic machine department of the General Electric Co., Schenectady, was cited. Automatic machines of every make and size are used to produce parts which vary greatly in material, size, shape and accuracy, and the department is being equipped entirely with Carboloy tools.

A notable achievement cited to illustrate how the tool material is able to make an otherwise non-machinable material available to industry was the machining of the

"Lo-Ex" aluminum alloy used for pistons by the Reo Motor Car Co. "This piston alloy was developed several years ago, and was known to possess valuable properties for this service, one in particular being its low coefficient of expansion," said Dr. Hoyt. "The high-silicon content rendered this alloy 'non-machinable' with the tool materials available at the time. With the advent of the cemented tungsten carbide tools it became possible to machine these pistons commercially."

Machine Tools Designed for New Tools

In discussing the effect of tungsten carbide on machine tool construction, reference was made to demonstrations of "carbide" lathes at the recent expositions held under the auspices of the American Society for Steel Treating and the National Machine Tool Builders Association. On these machines, designed especially to take advantage of the cutting efficiency of the new tool materials, cast iron was machined at a speed of 1200 ft. per min. and steel at 600 ft. per min., with a power consumption which exceeded 30 hp. This, it was pointed out, was a development since the introduction of tungsten carbide a little over a year ago. "The performance is of an entirely new order of magnitude," said Dr. Hoyt. "The speed and feed were such that the tool post runs from 40 in. per min. as compared to 20 in. or less per min. for high-speed steel. This should be sufficient answer, but it is capped by the situation that these new lathes are geared so high that high-speed steel tools will not work on them."

Improvements Adapt Gray Iron for Wider Use

IN an address on "Gray Iron—a New Material," E. J. Lowry, consulting metallurgist, Detroit, outlined at the opening session of the gear association meeting the possibilities of gray iron in its present status as a material for gears and other machine parts.

The loss of a great deal of the popularity of cast iron as a material of construction was attributed to the fact that the developments in connection with the improvements of the material had not been given sufficient publicity. "During the last ten years the consumption of malleable castings has increased 100 per cent and that of steel castings 200 per cent, whereas the consumption of gray iron has increased barely 10 per cent," said Mr. Lowry. "Improvements in the quality of cast iron have been commensurate with those in the other two materials, but whereas the malleable iron and cast steel industries have promoted the sale of their product by educational advertising, the gray iron industry has been comparatively inactive and depended wholly upon individuals and technical societies to enlighten the interested public regarding the progress made in the production of this material.

"During recent years, careful technical control together with mechanical improvements has largely eliminated the causes for the unreliability of gray iron. The patternmaker no longer uses a constant shrinkage factor, but varies the factor and thus eliminates certain strains. The foundryman has improved his melting conditions and obtains surfaces with better finish by sand control and better molding practice.

Many Types of Cast Iron

From the standpoint of the iron founder it is unfortunate that the nomenclature of the industry has not changed with the improvement of the product. In the mind of the average engineer cast iron is still cast iron. As a matter of fact, there are just as many types of cast iron as there are types of steel. Purchasers have generally bought on a price basis, and nine times out of ten they receive exactly what they pay for. Within the last few years some consumers have attempted to improve their product by specifying the analysis and the Brinell hardness when issuing purchase orders. While this improves the reliability of castings, the industry should go further and grade cast irons in the same way as steels are graded according to S. A. E. specifications.

"The need for such specifications is well illustrated by the example of semi-steel. This material is made with from 1 to 50 per cent of steel, but all mixtures are covered by the same term. The steel content might well be added to the hardness and strength figures.

"At the present time many foundries operate on a basis of strength control and produce cast irons having between 30,000 and 60,000 lb. per sq. in. tensile strength. In comparison with these results the textbook figure of 20,000 lb. maximum looks ridiculous."

Mr. Lowry referred to the special cast irons which have been developed in Germany and England, as well as to those developed in this country by the International Nickel Co. and Ross-Meehan company. One foundry which uses the process of the International Nickel Co. consistently obtained over 60,000 lb. in more than 100 heats. For tensile strengths of the order of 50,000 lb. per sq. in. it does not seem necessary to resort to the use of special processes, as these can be obtained by the addition of one or more alloying elements, such as nickel, chromium, molybdenum and vanadium. Each of these alloying elements has certain definite effects, and by combining them in suitable proportions, almost any desired results may be obtained.

Cast Iron for Gears

"In the gear industry cast iron has been losing ground, particularly in the automotive branch," said Mr. Lowry. "Engine flywheels for instance, formerly had the starter teeth cut in them directly, while now these teeth are cut in a steel ring which is shrunk onto the cast iron flywheel. The change was made mainly because of the porosity and the unreliability of the metal. Price played a big part. If the need for quality material had been impressed upon the consumer the troubles could have been avoided.

"In the machine tool industry cast iron gears have been replaced largely with bronze and steel gears. Bronze was chosen largely because of its greater resistance to impact. In some cases, however, alloy cast irons have regained this field for the iron founder.

"With an increase in tensile strength of cast irons their impact value also increases, sometimes in direct proportion and sometimes much faster. In one particular case an increase of 30 per cent in tensile strength was accompanied by an increase of 400 per cent in impact value. This combination of high tensile strength with high impact value is essential in industrial gearing because of the shocks to the gears when starting machinery."

In reference to the attempts to replace cast iron in machinery frames by welded steel sections, Mr. Lowry said that considering the finished product, the material cost is less in the case of cast iron than in that of welded materials or other than gray iron castings. With increase in strength, sections may be lightened and the safety factor be reduced in many instances.

To successfully use cast iron it must be bought on the basis of quality rather than of price; proper specifications must be applied to it, and a definite classification of cast irons must be formulated and adhered to.

Prizes for Developments in Gas Cutting

A series of prizes "for the best authenticated results when cutting iron and steel with the aid of illuminating or by-product gases, tending to lower the costs of present methods" will be awarded in 1930, 1931 and 1932 by Alexander Milburn Co., Baltimore, Md. These prizes amount to $1,000 each year, thus aggregating $3,000. Interested parties and contestants should address the Milburn company for further particulars and rules.

The preliminary announcement of the contest calls attention to the high cost of dissolved acetylene ordinarily used as a fuel gas in the cutting flame, and notes that various substitutes have been exploited for some years. "The most extensive ship scrapping program ever attempted was accomplished with apparatus using coke oven gas." Believing that such processes, which are used to a certain extent in many shops, have not yet been developed to their economic limit, the award has been offered to stimulate experimentation and development.

Non-Financial Incentives Important

Psychological and Economic Effects of Group Bonus Are Inseparable—Plan Applied to Office Workers

THE importance of good management to the success of an incentive plan was emphasized at a dinner meeting of the New York Metropolitan Section of the Taylor Society, held at the Fraternity Clubs, New York, Thursday evening, Oct. 24. While the program was devoted to a discussion of the group bonus, it was pointed out that in the application of any plan—individual or group—consideration must be given to non-financial as well as financial incentives. The two factors are inseparable, since psychological effects may nullify or accentuate economic considerations. Rate cutting, for example, may dampen the ardor of the employee, because behind his disappointment over the reduced rate is the fear that it may be cut again. Then again the employee's pride may be hurt if he finds that he is working at a lower base rate than a fellow workman on a similar job.

The human side of the problem, in other words, makes it advisable to separate the engineering from the administrative sides of developing a group incentive plan, in the opinion of Dr. C. C. Balderston, industrial research department, Wharton School of Finance and Commerce, Philadelphia. It is one thing scientifically to ascertain "par" for a given job and quite another to set the task for a given group of employees.

Administrative Functions

It is an administrative function to assign the task (to decide whether the base should be easy or difficult), to set the base rate and to select the bonus curve. These are questions of policy demanding the exercise of the best judgment at the command of the management. Whether all gains in efficiency should be given to the worker or divided between the worker and the company must be decided, and also whether the task should be expressed in money (gang piecework) or in time (group bonus). Time standards, if standard throughout an organization, offer the advantage of giving a basis of comparison for control records, said Dr. Balderston. All that is necessary is to express time in standard hours and compare them with actual hours worked, and a percentage of efficiency can be obtained for each group.

Complications Arise from Gang Piecework

Gang piecework has the surface advantage of appearing to be simple, the speaker declared, but it introduces difficulties whenever earnings are changed among members of small groups. Assume that A has a base rate of 60c. and B a base rate of 40c. and that together they earn $10 extra. A receives $6 and B receives $4. Later B is raised to the 60c. rate and the extra earnings remain at $10. This sum is now divided evenly and the attitude of A is that B's extra dollar came out of his (A's) pocket.

The group incentive appeals to those who believe in the philosophy of leadership as opposed to the philosophy of driving, declared Dr. Balderston. It emphasizes cooperative effort and teamwork in place of individual self-interest. The star worker is a hazard to others under an individual incentive plan. For example, if he makes too much money the rate may be cut. Under a group plan, on the other hand, the star is the hero of the group.

Leadership vs. Driving

The leadership theory advanced by Dr. Balderston was questioned by Dr. H. S. Person, managing director, Taylor Society, in a brief discussion of the group incentive. The group bonus is a deliberate shifting of the responsibilities of management to the employees, he declared, and may easily result in the gang boss driving the group or individual members driving out weaker members. Whether leadership or driving develops depends on management. It may be added that the kind of group bonus is no less important than the kind of individual incentive in determining whether the workers are driven or led.

Important to Have Minimum of Variables

Dr. Person declared that it is fundamental to the success of any plan that there be the most precise standardization of conditions and that there be a maximum of constants and a minimum of variables. It is not generally appreciated, he said, to what degree conditions can be controlled.

The setting of tasks frequently shows a lack of understanding of the principle that there is no use being more precise in one measurement than in measurements added to it, asserted Gorton James, of the editorial staff of *Business Week*. He said that he has a bone to pick with those who reduce a task to terms carried out to a fraction of a second and then add 40 per cent allowance for fatigue. All time settings are fallible, he believes, because human ability is too variable to be measured with the degree of precision that gets down to fractions.

The way a given plan is presented and the way it affects individuals must be coordinated with the whole problem of management, said Mr. James. It is one thing to work out a scheme. Once it is administered it becomes a labor problem.

Group Plan for Insurance Offices

The application of a group bonus plan to office workers was outlined by H. L. Rhoades, assistant to personnel officer, Metropolitan Life Insurance Co. He referred to what has been done by his company as an experiment, since heretofore incentives have rarely been considered in connection with office employees. The plan adopted now affects about 75 groups, each with its own unit of work. The number in the group varies from nine or ten to 200, with 45 to 50 regarded as the most satisfactory unit. A total of 7300 employees are now working under the arrangement and about 500 will be added before the year is out, bringing the number up to about 80 per cent of the entire office personnel.

Costs are used as the basis for the incentive. Since costs vary widely at different times of the year, a different base is used for each of 13 "months," the year having been divided into 13 equal four-week periods. In each case a four-week period is compared with the standard for that particular "month." This plan was selected because an arrangement was wanted that would make it possible to make payments throughout the year.

Both gains and losses are shared 50-50 with the company. If losses are made they must be made up before the next payment is made. Payments are allotted on the basis of salaries.

For a part of the employees the plan is now in its third year; for others it is in its second year. Results, although not yet regarded as conclusive, have been as follows:

1. The growth of the personnel has been completely halted. Previously the number of employees had increased 8½ to 9 per cent a year, just matching the growth of the company's business.

2. Total gross savings this year will be $1,750,000.

3. Overtime last year was cut to one-third of what it had been at its lowest.

4. Rate of turnover was cut 25 per cent last year. The reason lay in the fact that total personnel did not increase—turnover is always highest in new employees.

5. Employees' earnings last year increased 22 per cent. Eight per cent was due to the general leveling up of average salaries as a result of the sharp decline

in new workers, and 14 per cent was due to the bonus itself.

6. Office records have shown a very substantial improvement in accuracy.

7. Fair correlation between speed and accuracy seems to exist, although the records of the first year were not conclusive on this point and those of the second year only partially so.

8. The most beneficial effect of the plan has been in developing in the managing heads the ability to manage. They have a definite stake in planning, in forecasting work, in disciplining employees, in studying office methods and procedure. Groups, however, are not given credit for improvements of a major character, such as would result from the introduction of new machinery.

9. The entire plan is carried by five clerks, by an overhead of one-half of 1 per cent of the bonus payments.

10. There has been a very sharp reduction in controllable absence. The bonus is not paid during absences, whether excused or unexcused. The bonus is divided among those who remain at work.

11. There is greater willingness on the part of the group to take hold of peak loads. The problem of discipline has been partly shifted to the group itself.

R. G. Wagenet, director of the New York Building Congress and chairman of the Metropolitan Section of the society, announced that the next meeting, on Nov. 21, will be devoted to a discussion of the latest developments in industrial management in Russia.

Scrap Buyers Aided by Uniform Standards

Bureau of Standards Receives Commendatory Letters on Results of Simplified Practice Recommendations

ALTHOUGH the classification of iron and steel scrap, adopted in 1926 by the Division of Simplified Practice, Department of Commerce, does not yet enjoy universal acceptance, it has done a great deal toward clarifying the problems of buying and selling such material by specification, according to H. P. Dalzell of the division, who has just completed a survey showing the results and benefits.

Mr. Dalzell has prepared an article on the subject which will appear in the November issue of Commercial Standards Monthly, the news magazine of the Bureau of Standards.

At the meeting in New York last week of the Institute of Scrap Iron and Steel, attention was called to the fact that, though some of the large organizations in the country, such as the American Railway Association and the National Purchasing Agents' Association, have approved the scrap classifications, as now published in Simplified Practice Recommendation No. 58, a great many of the steel companies and other large consumers of scrap adhere to their old specifications. Steel companies, it was said, have specifications for No. 1 heavy melting steel which vary considerably. The scrap institute is working on uniform specifications for all districts and all consumers.

That the results of the adoption of the scrap classification have been beneficial to many consumers is borne out by numerous letters the Bureau of Standards has received, but Mr. Dalzell points out that greater cooperation is needed between producers, dealers and consumers. The Bureau of Standards circularized a large number of consumers, and among the replies received are many of a commendatory character.

The purchasing agent of a company producing steel castings wrote: "We have been able to place orders over the telephone for low phosphorus steel scrap by giving the number of your classification, and with very few exceptions the scrap received was the same scrap that we had in mind when we made the purchase. We were obliged, up until the time that we accepted your recommendation, to make special trips to inspect the scrap before we placed an order."

The purchasing agent of a machinery manufacturer said: "As a result of using your classification of iron and steel scrap, we have in the past three years been able to effect a very substantial saving in purchases of material for our gray iron foundry. Aside from the actual saving in money, we have been able to avoid misunderstandings with dealers by having a clear understanding as to the materials which they were to furnish."

The secretary of a foundry and machine works informed the Division of Simplified Practice that, "Under the simplified classification of iron and steel scrap accepted by us, we have eliminated grounds for controversy to a large extent, and expedited adjustment in those cases where the material did not meet specifications. It undoubtedly made it easier to purchase the grade and quality of scrap needed, with the added protection and assurance of the least possible chance of misunderstanding between buyer and seller."

Another industrial machinery company said, "We are using the classification of iron and steel scrap regularly with considerable saving, we know, because of the proper segregating of various materials."

The director of purchases of a Middle Western steel corporation wrote that his company is strongly in favor of simplified practices but could give no specific instance of dollars and cents savings. He continues, "However, we are thoroughly convinced that the scrap business is on a more business-like basis today than ever before, and we are getting a better grade of material for the same price than we formerly received There is a better understanding of the scrap classification and this, we feel, is conducive to economy. It has also helped the consumer in the way of according him protection against unscrupulous traders."

Another steel foundry and machine company said: "Referring particularly in our case to classification of iron and steel scrap, we find that there is greater care taken by the dealers in scrap to avoid misrepresentation in the grades that they are selling. We feel that the results are very satisfactory since we have had fewer rejections on account of inferior quality, both in chemical analysis and the physical structure of scrap."

An officer of one of the country's foremost motor companies wrote: "We cannot give you any report in dollars and cents, but we can say that the efforts made in the direction of simplified practice are making themselves manifest. Our interest was at first centered in that phase dealing with grading of scrap from a producer standpoint. We have found that these classifications recommended and adopted, as far as they may cover our particular grades, are recognized by consuming mills. However, the benefits we will derive from the broad use of simplified practice will be far reaching."

Chicago Interests Oppose Reopening Steel Rate Case

WASHINGTON, Oct. 29. — Independent iron and steel interests of the Chicago district have filed a petition with the Interstate Commerce Commission vigorously opposing the request of the railroads for reopening of the Official Classification territory steel rate case for rehearing as to the general level of the rates prescribed. Revenue losses claimed by the carriers in Trunk Line, New England and Central Freight Association territories, the Chicago interests said, fail to include the revenue figures for Illinois Freight Association territory "in which many of the Central Freight Association lines operate and in which territory they would receive substantial increased earnings as a result of the commission's scale 'F' rates." The scale referred to is the one set up to apply to all of Official Classification territory except New England whose scale is 10 per cent higher.

The Chicago manufacturers insisted that if the proceeding is reopened as to the general level of the scales the carriers in the entire territory shall present revenue studies for a current period throughout the entire territory. The petitioners were the Acme Steel Co., Clayton Mark & Co., Inland Steel Co., Interstate Iron & Steel, Joseph T. Ryerson & Son, Inc., and the Crane Co.

The State Corporation Commission of Virginia has filed a petition with the Interstate Commerce Commission asking that the proceeding be reopened and that that portion of Virginia on and north of the main line of the Norfolk & Western Railroad from Norfolk to Bristol be included in Official Classification territory so that this section may also be granted the rates prescribed.

Scrap Industry to Engage in Research

Institute to Create Special Fund of $50,000 to Carry on Various Constructive Activities

RESEARCH, as a means of improving conditions in the scrap iron and steel industry, widening markets and conserving the natural resources of the country, was the keynote of the meeting of the national advisory council of the Institute of Scrap Iron and Steel at the Hotel Commodore, New York, last week.

Cooperation with scrap consumers, the freight rate structure on old material, unfair competition among dealers and brokers in scrap, and the organization of a scrap export association under the Webb-Pomerene law were among the other subjects discussed.

The national advisory council decided to conduct an immediate survey involving the investment, employment and scope of the scrap industry and the production, consumption and distribution of scrap. It also decided to prepare a case to be presented to the Interstate Commerce Commission seeking a reconsideration of freight rates on scrap. A working fund of $50,000, in addition to the annual dues paid by members, will be created to carry on the various activities which the institute has planned.

The next annual meeting will be held in Chicago in March, 1930.

A frank discussion of the problems of the industry, such as has rarely taken place at a meeting of scrap dealers, characterized the two-day conference. Representative dealers from all sections of the country representing the 12 chapters of the institute were in attendance.

Unfair Competition Criticized

Unfair competition among the scrap dealers was sharply criticized by Benjamin Schwartz, director general of the institute, whose leadership of the scrap industry toward a better background, better ethics and better practices has been apparent to those who have watched the institute's activities in the past year.

"It seems that the scrap iron business has been conducted by intuition and not by facts," said Mr. Schwartz. "Intuition found the dealers long or short of the market, but it rarely found them with an assured profit, based on the facts of merchandising. Nobody was interested to plan ahead for the future of the industry. Nobody has been interested, because we, ourselves, were never interested in our future. One must search far and wide to find an industry like this one, that has operated in the dark, that has submitted in silence to circumstances which should have been corrected, and that stood by complacently while events were happening which should have been correctly interpreted.

Signs of Times Ignored

"One of the so-called trade customs that seems to have the sanction of law in this industry is the privilege or custom of one dealer cutting his own, as well as his competitor's, throat. This questionable privilege has been jealously guarded and preserved for years past, while on all sides of the industry cooperation, mergers and adjustment to modern conditions were flashing signals to the scrap iron dealers that were completely ignored. It is a rare dealer who knows the cost of his operations, or knowing it, knows how to use such knowledge. The psychology that has prevailed has been 'What can I lose?', and not 'How much profit can I make?' It is a rare dealer who has included in his vocabulary the simple word 'No,' when faced with a proposition on which he should know he cannot make a profit, were he to consider himself as a merchant of service or a manufacturer, as he properly should be. The mania for volume, without regard to the interests of competitors, has created a menace that will prove a boomerang to those who live by this rule. The problem in this industry is not price cutting but price boosting in the purchase of the materials of this business.

"The scrap iron industry must dig into the facts and must learn to face them. The knowledge of the few, which has been erroneously considered the secrets of the trade, must be made the possession of the industry. With the changes that will inevitably occur in the scrap iron industry in the next few years, this industry can benefit from the successful experience of American business by calling upon research to improve its service and create greater markets.

"This constructive program must be undertaken, if the scrap iron industry is to be recognized as an industry, and if it is to be in a position to demand certain fundamental rights, without which no business relationship can be profitable. The signs of the times all point to the elimination of business men or of an industry that does not keep pace with the progress of American business, that refuses to adjust itself to conditions, that continues to function blindly on the basis of intuition and speculation. The Institute of Scrap Iron and Steel has fortunately arrived at a time when men are beginning to realize the value of organization, when men are beginning to sense an industrial responsibility and consciousness. This program should be placed in the hands of leaders who have vision and the interests of the industry beyond their own selfish concern. The institute should be strengthened to meet its opportunities and demands for service. There can be no denying that the future of the industry is now inextricably tied up with the future of the institute and as the institute goes, so will the measure of the scrap iron industry be taken."

Export Corporation Proposed

The organization of an export corporation for scrap iron and steel was recommended by Luther Becker, chief of the iron and steel division of the Department of Commerce, at the dinner which closed the conference. According to figures submitted by Mr. Becker, 516,139 tons of scrap iron and steel were exported by the United States during 1928, approximately five times the tonnage exported in 1926. His address will be printed in a later issue.

The value of business statistics was emphasized by C. E. Wright, associate editor, THE IRON AGE, who said that the scrap industry was almost in a class by itself in that no reliable data regarding production, consumption and distribution of scrap have ever been gathered.

"While the members of the scrap industry may be the principal beneficiaries of the information to be gleaned from scrap statistics, a survey of the business should not be approached from a merely selfish point of view," Mr. Wright said. "The publication of such statistics should be of interest and value to producers and users of scrap and to the carriers of scrap, the railroads, and all of them should be willing to contribute their share of information to such a survey as the institute has planned."

He added that accurate facts of the industry are becoming more essential because of the trend of the industry away from speculative buying and toward merchandising of the product on a cost plus basis.

Buyers No Longer Misled

"Buyers are no longer misled by reports of scrap shortages," he said, "and it behooves you, as dealers and brokers, to know the obtainable facts of your industry so thoroughly that neither buyers nor sellers will be misled by rumors or propaganda set in motion to influence demand or prices."

Walter S. Doxsey, editor of the *Daily Metal Trade*, spoke of the value of research work in scrap, particu-

larly in establishing markets for alloy steel scrap through organization of the gathering and preparation of such scrap, which is a factor of growing importance to steel companies and scrap dealers alike.

Research Program Comprehensive

The research program, as outlined by E. G. Howell, Chicago, chairman of the research committee, covered five fields: 1, A survey of the industry; 2, specifications; 3, conservation, with special reference to alloys; 4, methods of operation, including cost accounting; 5, economics of the industry, including the problem of direct dealing between producers and consumers of scrap.

The trade customs committee, of which Harry Ehrlich, Springfield, Mass., is chairman, submitted a series of clauses to be included in a uniform contract, which it is planned to formulate for the scrap iron industry.

The trade relations committee, of which Charles Dreifus, Pittsburgh, is chairman, reported that it had heard evidence in five cases filed with the institute by leading consumers of scrap, involving violations of the code of business practices and had adopted measures to prevent a recurrence of these complaints.

At this meeting, a program of cooperation with consumers was outlined by Mr. Schwartz. "The Institute of Scrap Iron and Steel," he said, "has already given sufficient evidence of its sincerity of purpose and of its usefulness to the steel industry. It has furthermore demonstrated that there is no conflict between the best interests of the consumers and of the scrap iron dealers. There is a great field of cooperation between consumers and the institute which has yet to be developed, which should result in better and less costly scrap, a freer movement of this commodity, wider markets and full utilization of these by-products of American industry.

Economics of Direct Dealing

"The economics of direct dealing between consumer and producer should be carefully examined by the consumers. If the increasing practice of some consumers in securing their scrap without regard to the elements of fair competition with other consumers is countenanced by the steel industry, it will not be long before a system of undesirable competition in securing scrap will develop among the mills, a situation which they should not desire to see injected into the steel industry. The consumers will realize, if they have not already, that they cannot get service out of the scrap iron industry in times when their operations are high, if the scrap iron industry is prevented from operating. It ought to be evident that one cannot stifle and revive an industry at will.

"Cooperative discussion may not only prevent costly competition among the mills, but may also bring about a re-examination of the buying methods of some, which have created a paradox of increased costs of scrap for themselves and reduced profits to the dealers. Scrap is too important a commodity to the steel industry to allow it to be made the subject of a battle of wits.

Clarification of Specifications Needed

"Specifications of scrap and their interpretation could be discussed to the mutual advantage of consumer and dealer. In many cases, specifications still prevail that were framed many years ago and have not kept pace with the demands and conditions of American industry.

"The conservation of natural resources by the fullest utilization of all sources of scrap, especially alloys, which has assumed increasing importance, can be brought about by cooperation. Research into markets and freight rates, contemplated by the institute, with the cooperation of the consumers, would inevitably result in a freer distribution of scrap.

"The Institute of Scrap Iron and Steel is an appeal to the responsible leadership of the steel industry. It is hoped that a representative forum of leadership in the steel industry will be available in the near future for a consideration of these matters, so that there will be no necessity to seek advice and cooperation outside of the industry. This cooperation should be based on recognition of the service of the scrap iron industry and on recognition of the fact that this service is entitled to a fair return and consideration."

Two-Motor Direct Drive for Blooming Mill

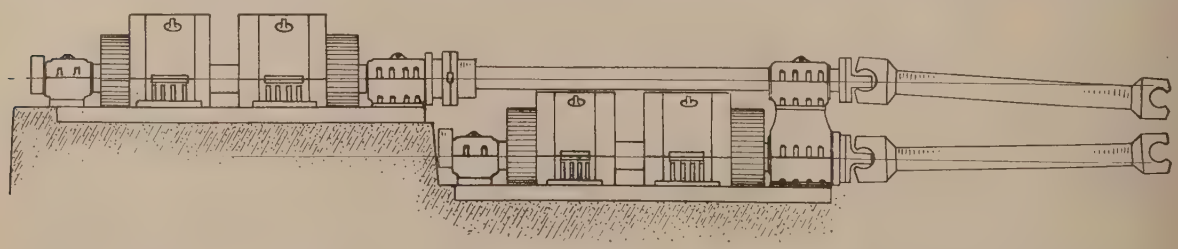
WHAT constitutes a two-motor direct drive for rolling mills, replacing the conventional drive with pinions, is indicated in the accompanying sketch. The drawing will serve to illustrate the 10,000 hp. in twin motors which the Illinois Steel Co. has arranged to install at its South Works for a 54-in. blooming mill. The equipment will include two 5000-hp. of 40 to 80 r.p.m. speed, a 9000-kw. motor generator having a 6500-hp. driving motor and a 180,000-lb. 15-ft. diameter steel-plate flywheel and the necessary control apparatus. The entire equipment will be supplied by Westinghouse Electric & Mfg. Co.

The development of this direct drive is one of the outstanding recent advances in rolling mill design. By using an individual motor for both the upper and lower rolls, the pinions and couplings required for the single motor drive are eliminated. The motors are reversing, and a means of maintaining correct speed relations is provided. Considering first cost, maintenance charges and friction losses, R. H. Wright, steel mill engineer of the Westinghouse company, considers the twin-motor drive as thoroughly logical, whether comparison is made with the single motor drive employing pinions or drives calling for higher speed motors with speed reduction units.

Metallurgical Uses of Natural Gas

The probability that the development of metallurgical uses for natural gas may stimulate the growth of chemical and metallurgical industries on the Pacific Coast is suggested by the United States Bureau of Mines. The Pacific Experiment Station of the Bureau, located at Berkeley, Cal., has recently had many requests for information concerning possible metallurgical uses for natural gas.

It seems possible that, for strictly metallurgical or chemical uses, that is, aside from the use for direct production of power, the fields of greatest theoretical interest will be the manufacture of hydrogen for ammonia syntheses, and the direct reduction of such oxides as zinc or iron. Although the direct manufacture of hydrogen from methane is possible, it seems that the most economic method for producing the pure hydrogen required for ammonia syntheses will be by the action of steam on metallic iron, the iron oxides so produced being again reduced to metal by the use of the natural gas.



Westinghouse Two-Motor Direct Drive for Blooming Mill at South Works of Illinois Steel Co.

Distribution, Research, Workers

Topics Covered by Industrial Engineers Have Expanded —Wage Incentives and Mechanization—Many Skilled Men Still Needed

TRENDS in business was the major subject for discussion at the sixteenth national convention of the Society of Industrial Engineers, held at the Hotel Statler, Cleveland, Oct. 23, 24 and 25. Trends pointed out by some of the speakers covered broadening the field of the industrial engineer to include problems of distribution, merging distribution facilities, paying greater attention to research work, adoption of better business methods forced on manufacturers by economic pressure, the tremendous development of greatly improved machine tools and the more general adoption of wage incentive plans. Mechanization of industry, it was pointed out, is not eliminating skilled mechanics, but rather is causing changes in skills and the shifting of skilled labor from some industries to others. Although some industries do not require as many skilled workers as formerly because of the increase of machinery and greater unit production, it was declared that there is a shortage of skilled labor.

Wider Conception of Field of Industrial Problems

THE broadened scope of the field of industrial engineers was stressed by Dr. W. F. Rittman, Carnegie Institute of Technology, president of the society, in a brief opening address. The society's activities, he said, were formerly limited to problems of production but now the members devote their attention to production, distribution and finance. Referring to the important problems of distribution, he mentioned the wide spread between the cost of production and the cost of the product to the ultimate consumer.

Distribution is a tangible engineer's problem and will be solved by engineers, declared Irving S. Paull, president Institute of Carpet Manufacturers of America, Inc., in a talk on trends in distribution and their effect on the future of industry. Years ago, he said, it was claimed that the cost of production could not be determined but it was determined. Now it is said that we cannot know the cost of distribution, but he believes this will be solved. He divided the making and marketing of merchandise into three functions — manufacturing, wholesaling and retailing. The manufacturer has completed his function when he has delivered his product to the wholesaler. Some manufacturers assume the function of wholesaling and others also assume the function of retailing. However, if they take over these functions they assume the expenses of wholesaling and retailing, but perhaps may be able to effect some economies.

Merging Distribution Facilities

The trend in distribution, according to the speaker, is toward merging distribution facilities as a relief from economic pressure. Pressure is being applied for precision in management. Broadest knowledge of its own industry is not enough for present-day management, he held. Management must have knowledge of other industries, because of the competition between industries.

There is a trend in the direction of vertical merging under one management, with two outstanding problems, manufacturing and distribution. Many manufacturers have no conception of the cost of wholesaling, and they do not save by assuming the duties of wholesaling.

He referred to the manufacture of goods which are inferior, because of adulteration, poor workmanship or for some other reason, to meet the pressure of competition, and said that this can be carried to a point which would result in abuse of the consumer. Establishment of minimum standards of quality, he declared, is one of the big problems of industry.

There is a tremendous waste in distribution; if that waste is taken from the cost to the consumer, the buying power of the latter would be increased in other directions. In 1900 48 per cent of production was in the essentials of living; this has been reduced to 32 per cent, in 1923. He believes that at present not over 28 per cent of production is for the bare necessities of existence. Physical requirements are now well supplied and he believes that future progress in industry will be in the matter of supplying the metal requirements.

Application of Intelligence to Management

Trends in industrial production and management were discussed by L. P. Alford, vice-president Ronald Press Co., New York. Various facts brought out by the Hoover report on recent economic changes, such as increase in production and decrease in number of wage workers, were referred to by the speaker. Never before, he said, has there been so much application of intelligence to the management of industry and to research.

He attributed one-half of the advancement in industry to the utilization of industrial management. Returns from industrial research could be placed at ten-fold. This has been devoted largely to the improvement of present production, rather than bringing out new products. No doctrine has spread so fast as that of high wages; high wages and high production go together.

Among trends in industry are mechanization, simplification, shorter hours and reduction in working forces, the surplus labor being absorbed in other fields without hardship. The automotive industry, he said, shows the greatest gain in increase in production, the increase in this industry per man-hour being 139 per cent. Industries which are decadent will disappear, he declared. Executives out of step with modern conditions will be forced out. Others will continue to progress. Outside economic pressure will keep them on their toes.

Making It Pay to Work Well

WAGE incentive was the subject of one general session. A committee to study compensation methods and incentive plans was appointed by the society a year ago; this committee's report was submitted in three papers. In addition, Adolph Langsner, Eugene Dietzgen Co., Chicago, who presided, gave a summary of a report on an independent study that he had made of compensation methods and financial incentive plans.

He found that plants making the same products often use different incentive plans. He discovered 36 different plans in operation, and declared that a classification of various plans is necessary. Incentive plans should not be a tool to make work hard, he said, but rather a tool to eliminate

waste and develop a cordial relationship with the management.

Nearly Half Are On Time Rates

Forty per cent of employees are still working on day or hour rates. He classed other methods of paying as piece rate, premium or bonus and profit sharing—including in the latter pensions and life insurance. The speaker showed in a series of charts the extent of compensation methods in various industries. Piece rate is far in the lead in the automotive industry. In the metal-working industry the day rate is somewhat ahead of piece rate and bonus system.

Human factors of wage incentives were discussed in a report by Eugene E. Brey, Wilson Western Sporting Goods Co., Chicago. He treated the subject largely from the standpoint of the psychological effect that incentive plans have on workers. Wages, he said, are only one incentive. The appeal of the plan to the worker should be wider than the mere financial reward. The relation between production and reward should be definitely established.

An incentive plan among other features should be simple and equitable; the base rate should not be below the going wage rate, the reward should be direct, sure and permanent, there should be a proper ratio between the reward and production, workers should be able to compare earnings with performance and payments for reward should be made separate from the regular wage payments.

Taking The Worker Into The Business

There is a tendency, he said, toward making workers parties to the administration of an incentive plan, and this has its advantages. As a definite trend in industry, he said that wage incentive plans are being adopted by those companies which are forging ahead.

A careful examination of various incentive plans should be made before one is adopted, said Alfred G. Trembly, Telletype Corporation, Chicago, in a report on wage incentive formulæ compared and evaluated. The manager, he said, is confused as to the system it would be best for him to adopt. The speaker's recommendation was that the manager analyze each plan in connection with conditions in his own plant. He showed on charts a proposed method of making wage plan comparisons.

Supervisory Force and Its Bonus

Incentives for office workers, supervisors and executives were discussed by John Paul Jones, Standard Oil Co. of Indiana, Whiting, Ind. He said measuring devices could be devised for executives, office help, employment managers and maintenance men. These measuring devices would include psychological principles. The same sets of principles followed in the shops would apply.

There are two plans for applying incentives to supervisors. One plan is based on departmental efficiency and the other on cost bonuses, the latter being more generally applied. He referred to a Chicago steel plant that had adopted a cost bonus system with very satisfactory results. Incentives for executives, he said, are usually based on profits and are successfully used in many plants. He believes there will be an increasing tendency to adopt incentive plans for office workers and executives.

Automatic Manufacturing

The machine age and its effect on industry was discussed by Richard H. Lansburgh, professor of industry, University of Pennsylvania, at a session presided over by C. E. Knoeppel, Cleveland. The new mechanization of industry, Professor Lansburgh said, is unlike any previous move in that direction. It has come about largely through the application of science to industrial problems.

In addition to replacing men by the development of improved machines, a large amount of unskilled labor has been displaced by conveyor equipment. Skill has been displaced by machines and scientific recording instruments. The speaker referred to the textile, pottery and cigar-making industries as among those which have reduced labor by improved machinery and handling equipment.

Machine Tools Revolutionized

Turning to the metal industry, he said that today, when a new part is to be produced, the manager's first thought is as to whether an automatic machine can be developed to do the work. Professor Lansburg reviewed some of the developments of machine tools and pointed out their effect. The machine tool industry has seen its product revolutionized, he declared, and the productivity of tools has been increased two to four times. Not only have special machines been developed, but standard tools have been greatly improved. Fully automatic machines have become commonplace.

Among the improvements which have increased production which he mentioned are increase in speeds and feeds, the hydraulic feed, which he said is now used on 70 lines of tools, and centerless grinders. He mentioned also new developments in attachments, jigs and fixtures and the possibility of further speeding up by the use of the new tungsten-carbide cutting tools.

We Still Need Skilled Men

Skilled men, he said, are not being eliminated by the substitution of machines, but skills are changing and new skills are being developed in handling machines. Numerous new sources have been opened up for metal workers and the industry is in a healthy condition, except for a dearth of high-grade mechanics. Temporary maladjustments of labor must be fixed by managements.

Another problem that confronts managers is the obsolescence of machinery due to frequent changes. Unless profits are high, good machinery used only for a short time cannot be thrown out for other tools having greater output. Executives of today, he said, must be in the forefront of machinery development, and must also be able to visualize the development of machines that have not yet been produced. He also must realize the social effect of shifting men from one industry to another.

Discussion of the machine age was led by Clifton Reeves, vice-president Mullins Mfg. Co., Salem, Ohio, who referred to the economic and other problems that have developed. The reallocation of labor, which must find new avenues of employment, he said, is a great problem.

Apprentice Training an Urgent Necessity

"Trend in Industry Demands More Skilled Mechanics" was the subject of a talk by C. J. Freund, apprentice supervisor of the Falk Corporation, Milwaukee. He could not tell whether there had been a reduction in skilled mechanics, because there has been no recent survey. He pointed out that, while a machine operator in a production shop is not a skilled workman, there are numerous other jobs in the shop requiring skilled labor, such as foremen, inspectors, repair men, time-study men, who together make the machine operator's job possible.

The speaker pointed to the danger in making a survey in two or three plants in which the mechanical processes are highly developed, and drawing conclusions therefrom. He presented a classification of workers in the plant of the A. O. Smith Co., Milwaukee, which showed that 33 per cent of the shop employees are skilled mechanics. In the shop department of the Falk corporation 26 per cent are skilled mechanics. He warned managers that they are not training enough apprentices. Every manufacturer, he said, should train its proper quota of apprentices.

Discussion of Mr. Freund's talk was led by W. E. Odom, director of the Department of Industrial Relations, National Metal Trades Association, who declared that a shortage exists in skilled mechanics. Shops of the association are now training 5000 to 6000 apprentice boys, but he said that this number must be greatly increased to overcome the shortage. Foremen are being recruited from the ranks of skilled mechanics and more supervision is needed than ever before. The solution of the problem, he said, is apprenticeship training.

Relations with Entering Employees

How applicants for work are handled in the employment department of the Frigidaire Corporation, Dayton, Ohio, was told in an interesting talk by Dr. Harry Myers, director of personnel of that corporation. His subject was "A New Concept of Personal Relations in Industry."

Bigness in mass production, he said, is squeezing out the human relationship. The first hard job in the employment department is to change the

attitude of men toward work and to teach them how to work. A large share of the applicants do not want to work; they simply want to get on the payroll. An attempt is made to change their viewpoint regarding work before they are interviewed. The company has laid down six rules, which are impressed upon job applicants:

1. Be clean and orderly.
2. Take good care of property, equipment and materials.
3. Follow instructions willingly.
4. Work well from whistle to whistle.
5. Work every day and tell your foreman when you cannot.
6. Work well with others.

Dr. Myers declared that many plant managers do not know where their employment departments are except from seeing the location on blue prints. In his opinion they could very profitably spend an occasional hour or two in the employment department, where they would get some direct information on the problems of the employment manager. Discussion was led by Glenn Forrester, personnel manager DuPont Rayon Co., Buffalo.

Age Limits and Pensions

A report prepared by the committee on research was made by Myron T. Jones, personnel consulting engineer, Cleveland, on limiting ages of industrial workers. It was brought out in the survey that the solution of the problem of age limits was made more difficult because industrial pension systems and joint insurance would put heavy loads on some companies if they applied no age limit.

A questionnaire on the subject was sent to a selected list of employees. Of the replies received, four were in favor of definite age limit for employment, one in favor of a qualified limit, 104 were against any limit and three were for a qualified no limit. Fifty-five per cent were in favor of and 45 per cent against a scientific pension system under state control. The necessity of providing for the support of aged men was stressed. They must have means of earning a living or be put on an old age pension. The committee declared that there is no one solution of the problems involved, and recommended further research of the subject.

George T. Trundle, Jr., Trundle Engineering Co., Cleveland, who led the discussion, said that there is another group to worry about besides the factory workers. That group consists of factory managers, superintendents, production men and others from 45 to 60 years of age, who have been squeezed out of their places of employment by mergers and for other reasons, and who often have great difficulty in finding new openings.

Time Study by Cinema

Application of the motion picture camera to time-study work and analysis was discussed at a meeting of the time-study engineering standardization committee by Allen D. Jennings, Cleveland, who has been engaged in development work along this line. His talk was illustrated with motion pictures taken for time-study purposes in the packing department of a Cleveland department store.

The motion picture film, Mr. Jennings pointed out, can be made a valuable instrument for measuring time and motions and to bring out the intricacies in operations which can hardly be caught with the eye. Another use which he believes will prove of great value will be for the training of employees by photography. Instead of taking a new man directly in to the machine he is to operate, he would first be made familiar with the operation by motion pictures and see the right way of doing it.

Progress of the various sub-committees on time-study standardization was reported by Thomas R. Hough, Wilson & Co., Chicago, chairman of the committee, and by heads of some of the sub-committees. These reports indicated that the committees have done a great deal of research work and that their reports are well under way. These after editing will be published in book form, for the use of time-study men and as text books in colleges.

Accounting Methods Need Revision

A revolution in accounting methods was predicted by C. Charter Harrison, Stevenson, Harrison & Jordan, Chicago, who discussed "Is the Present-Day Accountant Doomed to Extinction?" The industrial accountant of tomorrow, he said, will be entirely different from the accountant of today, due to change in industrial conditions.

The factory formerly occupied the first position in the industrial structure, he declared. But the factory now has taken second place to the sales department, due to the fact that the production capacity of industries has been increased to such an extent that it is well in excess of the demand. Discussion was led by E. S. LaRose, Bausch & Lomb Optical Co., Rochester. Trends in supervision were discussed at the same session by G. E. Schultz, consulting engineer, New York.

The sessions included a fatigue-committee dinner meeting which was presided over by George H. Shepard, Purdue University, chairman of the committee on elimination of unnecessary fatigue. Fatigue and rest periods were discussed by A. B. Segur, consulting engineer, Oak Park, Ill., who gave a practical demonstration of motion time studies. Effects of noise on industrial workers were discussed by R. F. Norris, C. F. Burgess Laboratories, Inc., Madison, Wis.

A session was held by the maintenance group, presided over by Perry A. Fellows, city engineer, Detroit. Trends in maintenance planning were discussed by H. E. Ramsey, industrial engineer, Philadelphia Rubber Works, Akron, Ohio; better planning for plant alterations by Milton F. Wagnitz, engineer of public structures, Detroit; and smoke abatement practice for maintenance men by Charles J. McCabe, chief smoke inspector, Detroit.

The New Officers

At a meeting of the board of directors John M. Carmody, editor *Factory and Industrial Management*, Chicago, was elected president. Eugene A. Rummler, Rummler & Rummler, Chicago, was named as treasurer and George C. Dent as executive secretary, both being re-elected. The four vice-presidents were re-elected. They are Albion N. Doe, consulting industrial engineer, New York, vice-president in charge of promotion; Perry A. Fellows, city engineer, Detroit, vice-president in charge of research; John Calder, Springfield, Mass., director in charge of industrial relations of the International Y.M.C.A., Eastern regional vice-president; and C. H. Gullion, industrial engineer, Swift & Co., Chicago, regional vice-president for the Middle West.

President Rittman presided over the annual dinner, held Thursday evening. The principal speaker was the new president, John M. Carmody, who discussed the merger age in industry.

Morning and evening sessions were held, leaving the afternoons for plant visitations. Among the plants visited were Nela Park plant of the General Electric Co., White Sewing Machine Corporation, Industrial Rayon Co., Cleveland Electric Illuminating Co., and Allyne-Ryan Foundry Co., Cleveland, and B. F. Goodrich Co., and Goodyear Tire & Rubber Co., Akron.

Aircraft Lull Seasonal, Says Kinner Sales Head

"The present lull in aircraft production is no indication whatever in computing business for 1930 and the future," says R. Ernest Tucker, head of the sales and service department of the Kinner Airplane & Motor Corporation, Glendale, Cal.

"Many aircraft manufacturers," he says, "have held up production because of delay in receiving their approved type certificates; also the aircraft business has grown so rapidly that many manfacturers have not had adequate time to build up their sales organizations as they should.

"Although the aircraft business will be undoubtedly somewhat seasonal, as is the automobile business, foreign trade will offset this fall and winter decrease."

Foundrymen's Transactions to Appear Monthly

A monthly publication is to be issued by the American Foundrymen's Association commencing Jan. 15, 1930. The board of directors has unanimously approved a plan to print its *Transactions* each month instead of yearly. The monthly issue will displace the quarterly *Bulletin*, the last number of which will be issued in November. The *Transactions* will include papers and discussions at annual conventions.

Tool Builders to Hold Show in 1932

Association at Annual Meeting Decides Upon Three-Year Interval Between Expositions and Upon Expansion of Activities

THE next National Machine Tool Exposition will be held in Cleveland in 1932. This decision was reached by a majority of the delegates attending the twenty-eighth annual meeting of the National Machine Tool Builders' Association at Briarcliff Lodge, Briarcliff Manor, N. Y., Oct. 21, 22 and 23. Although a considerable minority favored an exposition two years hence, the advantages of a longer interval between shows made the three-year period seem preferable.

By a unanimous vote the delegates approved the expansion of the association's activities during the coming year. Numerous group meetings were conducted during the convention and much was accomplished looking toward a betterment of trade practices. Seventy-seven companies were represented at the convention by 135 delegates.

C. A. Johnson, president, Gisholt Machine Co., Madison, Wis., was elected president of the association by the board of directors. Howard W. Dunbar, works manager, Grinding Machine Division, Norton Co., Worcester, Mass., will serve as first vice-president; Robert M. Gaylord, president, Ingersoll Milling Machine Co., Rockford, Ill., second vice-president; and Frederick V. Geier, vice-president, Cincinnati Milling Machine Co., Cincinnati, treasurer. Directors named for a three-year period by the association are C. R. Burt, vice-president and general manager, Pratt & Whitney Co., Hartford, Conn.; George E. Randles, president, Foote-Burt Co., Cleveland; and Mr. Gaylord.

C. A. JOHNSON, newly-elected president of the association, has been head since 1908 of the Gisholt Machine Co., Madison, Wis., which was founded by his father, John A. Johnson

Industrial Statistics Discussed

An outstanding contribution to the convention was an address by Virgil Jordan, economist of the McGraw-Hill Publishing Co., New York, who took for his topic "Industrial Statistics as Tools of Business Management." He pointed out that business today is undergoing a rather marked reaction in some lines from the unwise and uncontrolled expansion during the past year. Mr. Jordan said, in part:

"The stock market set the pace for this reckless discounting of the future and is paying the price first and most emphatically. Creeping bears are an improvement on wild bulls. Automobiles, building and steel are showing the effects of excessive bullishness. But the general business situation remains fundamentally normal and sound. The growth of general trade is proceeding at its usual regular and steady rate, and some of the industrial weak sisters like coal and textiles, who have been pushed aside for some years by the rather wild rush of the heavier industries, are picking up courage to show what they can do.

"The unbalanced situation is due in large part to failure to make the best use of the statistical guides to business conditions which are now available. Despite the enormous mass of statistics available today, individual industries and business men make very little use of them in determining their business policies, and what use they do make of them is frequently wrong or misleading. Our knowledge of general business movements is far from complete, but it is sufficient to provide the individual concern with a fairly good guide in planning production and sales programs. If each industry would attempt more carefully to adjust its policies to the general rate of business growth instead of trying constantly to break step and steal a march on the country as a whole, such recurrent fluctuations, readjustments and disappointments as we are now experiencing could be avoided.

"The general and quite superfluous anxiety about the business situation at the present time is a striking illustration of the immature and unrealistic attitude which still prevails among business men and the general public toward economic conditions in this country. Despite all the solemn assurances we have been given about the increased stability and scientific control of American business, the fact is that American business psychology is still in the grip of a chronic boom and depression complex—a hangover from the glorious and terrible experiences of an economic childhood which it has not yet outgrown.

Business Does Not Seek Stability

"The fact is that we haven't had any greater stability in most important lines of industry since the war, because American business is not interested in stability. It is not satisfied with the steady and regular growth which general trade should normally have in a highly developed country like this. It is interested only in spectacular record-breaking performances. Unless things keep on going up forever at a dizzy pace year after year it feels that the country is going to the dogs. It forgets that every excessive expansion in any line beyond the normal expansion of the market has to be paid for by a corresponding falling off in some other field and finally in the record breaker's own line as well. There is no realization that sustained general prosperity depends upon control coordination and balance in our business activity as a whole."

In the gathering of industrial statistical information, said Mr. Jordan, trade organizations must be chiefly relied upon. They can secure, tabulate and disseminate the data more quickly than governmental agencies. The main reason why the individual company should contribute its share of information in regard to orders, shipments and cancellations is that it will not know what others in its own line of manufacture are doing without the collective data which cannot be gotten unless it participates in the effort.

Apprenticeship Training Urged

Henry Buker, vice-president, Brown & Sharpe Mfg. Co., Providence, R. I., in his address as president of the association, stressed the value of ap-

H. W. DUNBAR, works manager, Grinding Machine Division, Norton Co., Worcester, Mass., is the new first vice-president.

prenticeship training to the individual shop as well as to the industry in general. He said that it is especially desirable to have good apprenticeship courses in shops located in communities where there are few or no other shops offering such training. He suggested that a rigid schedule be laid out and followed carefully. The very rigidness of such a course would be much in its favor, for it would take a young man at the age when he is susceptible to influence and train him along definite lines.

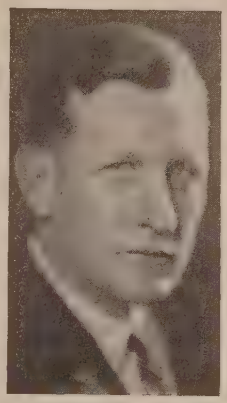
"You need as your assistant foremen and foremen," stated Mr. Buker, "men who have received a thorough training and whose habits and experiences have been such as to make them understand sympathetically the thoughts and habits of the men under them. An apprenticeship course, properly handled, is the very best school from which to draw future factory executives. Any concern, no matter how small, which does not have such a course is neglecting a real opportunity.

"I believe that the general manager of a business should either interview each apprentice at least two or three times during his apprenticeship training, or should delegate a committee of three, composed possibly of the factory manager, sales manager and chief engineer, to talk with the boys occasionally and find out, as far as possible, the boys' leanings and aspirations.

Apprentices Should Not Be Misjudged

"There have been many apprentice boys who have been failures in the shop, but who have proved to be exceptional designers or salesmen. The shop foreman is often inclined to judge a boy solely by his ability to produce work accurately and cheaply. Some of our most brilliant men are naturally clumsy with their hands, and we have all known good executives who could tell others what should be done and how to do it, but could not do the work themselves if called upon to do so. Frequently, the boy with initiative and a brilliant, inquiring mind causes more or less annoyance to his foreman, whereas the quiet, patient artisan type, who asks no questions and does his work methodically and well, wins very high praise, although he does not have the least trace of executive ability.

"Many concerns have remarkable executive material among their apprentices about which they never know, because the management does not actually seek for signs of such ability among the boys, but rather



R. M. GAYLORD, president, Ingersoll Milling Machine Co., Rockford, Ill., will serve as second vice-president and a director.

leaves it to the men down the line to bring such ability to their attention. How can you expect an assistant foreman, who has always thought in terms of his own work, to point out to you a potential Ralph Flanders, a Clayton Burt or an Ambrose Swasey?

"Today many of our factories are coming gradually into the hands of the second generation, and unless they find an apprenticeship system already installed in their shop, some of them are likely, because of their own training or lack of it, to feel that such a course is not necessary. I am a very great believer in an apprenticeship training for every boy who expects to take a responsible position in the factory end of a machine tool busi-

H. BUKER, vice-president, Brown & Sharpe Mfg. Co., Providence, R. I., is the retiring president.

C. R. BURT, vice-president and general manager, Pratt & Whitney Co., Hartford, Conn., elected a director.

ness. Many have succeeded without such training, but you will find that in nearly all cases, they have had practical men associated with them."

Companies Hold To Published Prices

In discussing certain trade practices, Mr. Buker declared that "there is no reason why any manufacturer should offer any more for a used machine than it is actually worth to him, either in his own factory or for resale purposes. It speaks very highly of the progress we have made in recent years that today there are very few machine tool concerns in the country which would not feel cheapened in their own minds as well as in the minds of their competitors if they were deliberately to cut the published price of their machines in competition. When the industry as a whole can be brought to the same feeling in regard to cutting prices by the subterfuge of taking in used machinery at a loss, we shall have no further trouble because of this practice."

In his report as general manager of the association, E. F. DuBrul said that when the calendar year 1929 is completed, the order volume of this year will doubtless exceed the orders for 1920 and probably those for 1919. "We have only 400 more points to go to equal the 1919 figure; we have three months to do it in and our last quarter's orders ran better than 200 points per month. So in business booked, this year will most likely be the best in the 11 years covered by our index. The net earnings of the industry for the last 18 months should show up decidedly better than for any similar period since the war. Perhaps they may show better than for any similar period before."

Mr. DuBrul emphasized that although some recession is going on in business generally, it is not likely to reach the low point made in 1927. The interest displayed by visitors at the recent Cleveland Show indicates much "ability-to-pay and will-to-buy," which should be turned into sales during a number of months to come. He stressed the fact that some falling off in orders should give the industry a chance to relieve production pressure.

Many Groups Reporting Data

The association, said Mr. DuBrul, is now getting monthly sales figures from the following groups: engine lathes, shapers, planer type milling machines, die heads, surface grinders, tool and cutter grinders, turret lathes and planers. He urged the groups to push forward with standardization of their tool-holding and work-holding elements and pointed to the accomplishment of the milling machine group in standardizing spindle ends. He said that the turret lathe and automatic lathe groups also are close to an agreement on standardization.

Mr. DuBrul also touched upon the association's cost work, the value of its monthly index of orders as a business barometer and the higher standing of the industry in the eyes of its customers, the latter development being partially due to the two successful expositions held by the association. Mr. DuBrul said that users who saw the show at Cleveland this year were deeply impressed with it as a striking demonstration of the power of the association as an organized group. "We made them 'machine tool conscious,' as the advertising men express it."

Speaking on "Business Needs To Analyze Distribution Costs," W. B. Castenholz, Castenholz & Dittmar, certified public accountants, Chicago, declared that neither cost accountant nor general accountant has until recently given much thought to consolidation of expenditures for distribution of manufactured products. "Until such consolidation occurs, we will be unable to set much needed standards of performance and outlay in distribution activities. My plea is for the application of cost accounting principles to the manufacture of business as well as to the manufacture of goods. The monthly profit and loss statement of a manufacturer who has an adequate cost system will reflect a fairly true margin between sales and cost of sales, because only sales actually shipped each month are costed, but surely net profit or loss on present monthly profit and loss statements is entirely inaccurate, because distribution costs thereon bear positively no relation to specific shipments made."

Uniform Sales Contract Discussed

W. W. Tangeman, sales manager, Cincinnati Milling Machine Co., Cincinnati, submitted to the convention the preliminary report of the committee on uniform sales contract of which he is chairman. After pointing out some of the objections to a uniform sales contract, the committee agreed that "if member companies who sell direct and the representatives of those who sell through agents could agree to use a standard form with standard protective clauses for making all proposals, they could protect themselves against the few unscrupulous buyers as effectively as by contract, inasmuch as a proposal made in combination with a purchase order placed against it really is a contract and is so interpreted."

The committee recommended that the printed proposal form which should accompany all quotations should cover such matters as delivery, terms of payment, shipment, estimated time of shipment, production estimates and cancellations, with amplifications where needed to cover the situation properly. The committee further stated that the form should be free from technical language, if possible, the meaning of the conditions should be clear and the conditions should not appear too formidable, but at the same time should give the protection required.

Exposition Committee Reports

J. Wallace Carrel, vice-president and general manager, Lodge & Shipley Machine Tool Co., Cincinnati, made the report of the committee in charge of the Cleveland exposition. Colonel L. S. Horner, president, Niles-Bement-Pond Co., New York, described the work that the committee in charge of the United States Census of Manufactures proposes to do. The financial condition of the association was set forth by August H. Tuechter, president, Cincinnati Bickford Tool Co., retiring treasurer.

Resolutions were adopted by the association paying tribute to the following members who died during the past year: Worcester R. Warner, founder of the Warner & Swasey Co., Cleveland; Henry W. Wendt, president, Buffalo Forge Co., Buffalo; and Joseph E. Hubinger, president, Eastern Machine Screw Corporation, New Haven, Conn. At the opening session the convention unanimously passed a resolution to send a cablegram of felicitations to Oscar Harmer, formerly of Alfred Herbert, Ltd., London, England, on his eightieth birthday.

General sessions, at which Mr. Buker presided, were held on the afternoon and evening of Oct. 21, and the morning and afternoon of Oct. 22. The members were especially gratified by the announcement at the last session that the board of directors had recognized the services of Mrs. F. F. Selbert by appointing her secretary of the association.

Republic Acquires Union Drawn Steel Co.

Formal Announcement of Purchase Made by E. T. McCleary, President of Youngstown Company

PRESIDENT E. T. McCLEARY of the Republic Iron & Steel Co. Monday announced that terms have been arranged for acquisition of the Union Drawn Steel Co., Beaver Falls, Pa., the largest interest of its kind in the country. The purchase is subject to an appraisal and audit, to be conducted at once by the Republic company. The latter assumes immediate charge of the properties.

The Union Drawn Steel Co. has a net worth of $14,000,000. Its capital structure consists entirely of common stock, and it has no outstanding bonds. The company operates plants at Beaver Falls, Pa., Massillon, Ohio, Hartford, Conn., Gary, Ind., and Hamilton, Ont. It manufactures cold-drawn stock, and consumes annually about 250,000 tons of steel products. It is the largest buyer of merchant steel bars in the country.

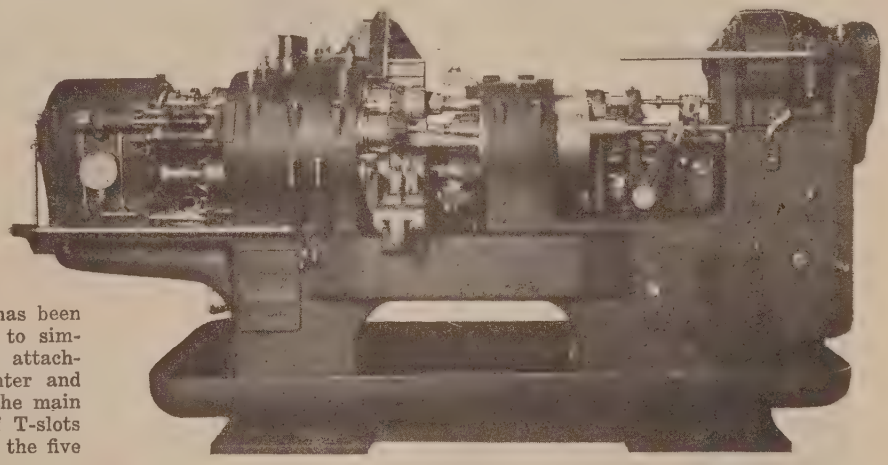
It is the plan of Republic to continue Union Drawn as a subsidiary company, under the present management, headed by E. S. Hoopes, president.

Large Hydraulic Chucking Machine

Five-Spindle Self-Contained Automatic Features Convenience of Operation and Tooling

A SEVEN-INCH model M five-spindle hydraulic chucking machine for first and second operation work has been added to the line of the Cleveland Automatic Machine Co., Cleveland. The machine is entirely self-contained, and is provided with a hydraulic chucking mechanism that is simple and positive. Accessibility, permitting the work of tooling to be performed from the front of the machine, is also a feature.

Of barrel type, the tool turret follows the conventional design of the company's model A and M machines. It moves back and forth in wide bearings on the tool turret housing, and is kept in alinement by a large key in the housing. Double clamping bushings, one on each side of the turret holes, assure positive grip on the tools. An extra attachment has been provided for the tool turret to simplify tool combinations; this attachment is mounted in the center and extends beyond the face of the main tool turret, with a series of T-slots that extend lengthwise along the five sides.



THE Hydraulic Chucking Mechanism Is Adjustable for Heavy and Light Gripping, to Suit the Nature of the Work. All tooling may be done from the front of the machine

Tooling sequence provides for standard tools in the No. 1 and 2 positions that advance with the turret at the same feed. In the No. 3 and 4 positions, upper and rear top, the tools are clamped in independent revolving spindles, moving longitudinally in the tool turret but individually controlled by levers actuated from a drum and cams mounted on the upper camshaft. The loading station, at the upper front or fifth position, is also independently controlled but does not revolve. Spindles No. 3, 4 and 5 can be cammed to complete their operation ahead of, or at the same time, as the other cutting tools. Threading, tapping or extra revolving spindles can be arranged.

Hydraulic Chucking Unit

The hydraulic unit consists of a high-pressure variable-delivery pump, a low-pressure gear pump, a stroke control lever, a pressure changing mechanism and a built-in control valve. These parts are mounted as a unit in the oil reservoir located at the right-hand rear of the machine. The drive is by silent chain from the feed bracket.

The high-pressure pump is of five-piston type; when the maximum pressure is reached delivery of oil is reduced automatically. The low-pressure pump provides the back pressure on the high-pressure pump, and also serves to operate the stroke control lever, which regulates the delivery of the pump from 20 to 550 cu. in. per min. The pressure regulator, which can be adjusted while the machine is in operation, permits varying the pressure from 0 to 1000 lb. per sq. in. A control valve built into the body of the unit serves to control the action of the pump.

A single automatic valve, located at the rear of the spindle turret and between the work spindles, is connected directly to individual oil cylinders, one on each spindle, and controls the opening and the closing of the chucks. This five-way valve is designed so that pressure is maintained on four cylinders while the fifth cylinder is operated for opening and closing the chuck. Either hand or automatic operation of the oil cylinders is provided for.

Work spindles are made of alloy-steel forgings and are mounted in Timken roller bearings, two at each end. The spindles are driven by hardened alloy-steel gears from the main driveshaft, which passes through the center of the tool and spindle turrets to the main drive bracket at the right-hand end of the machine and is covered by a steel sleeve. The indexing cam is located on the lower camshaft.

The stop spindle mechanism is entirely automatic and is controlled from an independent oil cylinder mounted between the spindle turret and the hydraulic unit. It is operated by an independent oil line connected to the low-pressure pump, engaging and disengaging the spindle drive clutch, and at the same time applying the spindle brake mechanism to stop the spindle rotation. Spindle change gears provide for 20 speeds, ranging from 61 to 756 r.p.m. The gears are mounted on the end of the driveshafts and may be changed conveniently.

Bed and Housings Cast Integral

The main bed casting, with spindle and tool turret housings are cast integral to assure rigidity and maintain permanent alinement between the work spindles and turret tools. The pan and oil reservoir are also in one piece, and ample space is provided for chips.

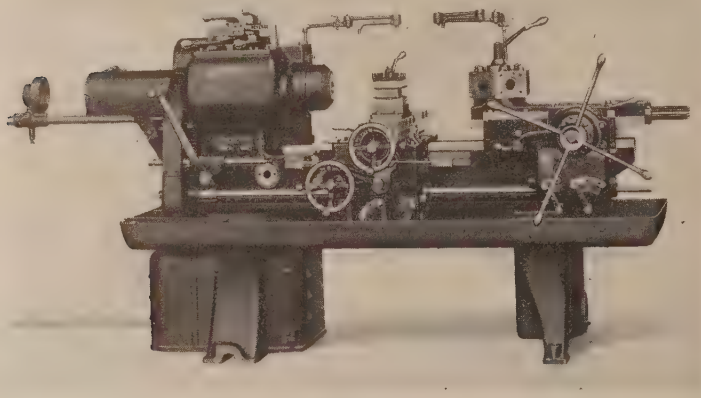
There are two camshafts; the upper camshaft carries the wormwheel and drum for accelerated spindles, tool turret and cross-slide drums, while the lower camshaft carries the indexing and wedge operating cams, spindle brake and chucking control cams. The wormwheel, mounted on the extreme end of the upper shaft, has T-slots in its outer face, and carries the adjustable feed trip pins for shifting from slow, or working feed, to the high or indexing movement.

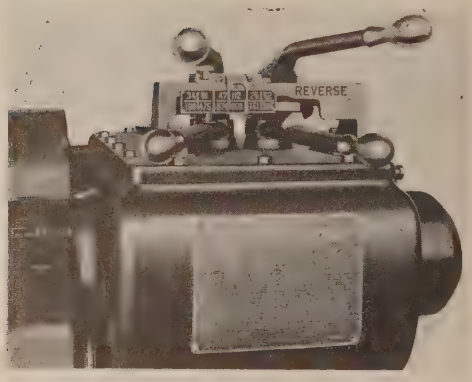
Three forming slides are provided. The two lower slides, front and rear, operate independently of each other. They are controlled by cams on the periphery of the operating drums, and are accelerated by bell cranks connected directly to the slides. A double top-slide, mounted on the spindle turret cap, provides two forming stations in the third and fourth positions. Movement of this slide is from a cam box. Tool feed is independent of the high-speed indexing movement, and is controlled by trip pins carried in T-slots in the face of the worm wheel that can be adjusted to suit the length of cut. The pins engage a pawl on the trip liver, shifting the clutch from high to low, or vice versa.

General Electric Co. sales billed during the first nine months of 1929, announced by Gerard Swope, president, amounted to $301,812,808, compared with $242,676,762 for the corresponding period last year, an increase of 24 per cent. Profit available for dividends on common stock for the first nine months of 1929 was $47,965,831, compared with $36,910,649 for the corresponding nine months last year.

Adds New No. 5 Universal to Turret Lathe Line

A NEW No. 5 universal with a 12-speed all-geared head has been added to the line of ram-type turret lathes manufactured by the Warner & Swasey Co., Cleveland. The machine has bar capacity of 2 in. round stock, and 13 in. effective turning movement of the turret slide for any one setting of the saddle along the bed. The maximum swing over the bed is 19 in. and over the cross-slide, 9¼ in.





THE New Hexagon Turret Unit Incorporates Features That Prolong Its Accurate Life. Head and bed are cast in one piece, and head walls are of box construction, eliminating the split at center line of spindle bearings. Direct-reading speed indicator may be seen in close-up view at left

The head and bed are cast in one piece, this casting being of nickel semi-steel. The head walls are of box construction eliminating the split at the center line of the spindle bearings, which are set in solid metal. In general design the head follows closely that of the company's heavier "A" type machines. The 12 spindle speeds range from 26 to 658 r.p.m., and are obtained through hardened alloy-steel gears sliding on hardened multiple-splined shafts. A patented speed indicator, shown in the close-up illustration, instantly shows the spindle speeds for the various position of the levers. The working spindle and head gear shafts are mounted on Timken roller bearings, and the entire head mechanism runs in a bath of oil.

Forward and reverse multiple-disk clutches are mounted on a high-speed driving shaft. The single pulley on this shaft is conveniently positioned for motor driving, either by a motor placed in a pedestal leg at the head end of the bed, or fastened to vertical plate at the rear of the headstock.

The universal cross-slide carriage has six power longitudinal and cross feeds. All feeds are contained in the apron and can be reversed. There are four cutter positions on the square turret and one on the rear tool post. The square turret can be quickly indexed and clamped by a quarter turn of the lever. Six independent adjustable stops carried on a stop roll are employed to throw out the longitudinal feed.

Lubrication of the cross slide unit has been concentrated at three points and made convenient for the operator. Two large reservoirs, one at each side of the apron, hold sufficient oil to supply all the apron bearings. At the third point a plunger pump, located at the front of the cross-slide, forces oil to the cross-feed screw, nut, and bearings, as well as to the dovetail slide and those portions of the bed ways under the cross carriage.

A new type of hexagon turret unit incorporates several features which tend to prolong its accurate life and add to its rigidity. First, the slide moves on hardened steel ways attached to the saddle; these hardened steel ways relieve the tendency of the saddle to "wear forward." Secondly, the top caps have been made heavy and are fitted with horizontal taper gibs to secure better adjustment for wear at the top surface of the slide. Taper gibs placed at the sides of the slide also permit reestablishing the original alinement as wear occurs on the sides of the slide.

Six power feed changes are contained in an apron mounted at the front of the saddle and are independent of those in the cross-slide apron. Independent adjustable stops for each turret face may be set to throw out the feed at any point.

For bar work, the machine is furnished with an improved automatic chuck and bar feed. The operating lever actuates a pivoted yoke equipped with rollers which fit into the circular groove of the stepped wedge, the fingers being also equipped with rollers. This construction is intended to reduce substantially the effort required to operate the chuck. Oil pan and pump are standard equipment. The oil pan has been made wide at the front to better protect the operator from cutting compound and chips. The oil pot is built into the foot end leg, the opening being in such a position that chips do not fall directly into the strainer. A taper attachment that can be fitted to the rear of the cross-slide carriage will cut tapers up to 3 in. per ft. in lengths of 8 in. The chasing attachment for the cross carriage, also furnished special, can be used to cut from 4 to 32 threads per in. The leader is clamped on the carriage feed rod and the follower nut is bolted to the chasing lever.

Efficiency of Machinists' Vises

Operating efficiencies of machinists' vises are discussed in research paper 91 of the United States Bureau of Standards. An investigation was undertaken to determine the relationship between the size of a vise and its efficient working in typical shop operations on material held in it. Sawing, bending and riveting of steel specimens were carried out under carefully standardized conditions. Twelve vises of the stationary-bottom type were used, having jaw lengths from 2 in. (9-lb. vise) to 9 in. (282-lb. vise).

Static tests, such as sawing, in which the movement of the tool is large compared with the movement of the vise, showed no appreciable difference in the efficiency with which the work was performed. Dynamic tests, on the other hand, including riveting and some of the bending on large specimens, showed that the weight or inertia of the vise has an appreciable effect on the efficiency of work done in it. This efficiency seemed to reach a maximum with 5½-in., 102-lb. vise, which operated better than any of the lighter vises. From this size upward, however, there was little, if any, gain in efficiency.

By-Products Recoveries, Inc., New York, manufacturer of dust collectors, has opened a Chicago office at 608 South Dearborn Street. Frank Trott is in charge.

This Issue in Brief

Cuts production cost by simple, inexpensive material control system, adapted especially to needs of small plant. The "heart" of the system is a "supply and demand" sheet, which is essentially a perpetual inventory record showing material ordered, invoiced, stocked and sold.—Page 1153.

* * *

"Spoiled goods" report to management reduces scrap. Inspectors must make out a report, giving name of the department responsible and reason for scrapping.—Page 1155.

* * *

Continuous heat-treating process solves problem of making stainless tubing with uniform physical properties. Soft strips are formed on a drawbench, on which is fitted an electric tube furnace. The tubing passes through the furnace, where it is soaked for at least 2 min. before emerging into the air. It is then drawn through a water-cooled die.—Page 1159.

* * *

Hollow ingots are used for making seamless steel tubes. Ingots are cast with a collapsible core. They are then elongated in a special rolling mill.—Page 1160.

* * *

Fire hazard reduced by equipping dipping vat with hinged cover held open by a rope. In case of fire, the rope will burn through and let the cover drop on the tank.—Page 1163.

* * *

Low maintenance cost is obtained by laying out repair shop with the same forethought used in planning production departments. Electrical repair shop in big plant is designed to eliminate lost motion.—Page 1161.

* * *

C. M. Schwab says fundamentally sound condition is largely responsible for uniform prosperity.—Page 1166.

Chromium-plating failure "mysteries" are usually due to lack of experience. Each chromium-plating job presents its own problem. The expert can usually predict where trouble will occur.—Page 1164.

* * *

For high fatigue resistance, homogeneity of the metal should be striven for, as fatigue failure can not occur, it is believed, unless the stress on the entire piece is sufficient to start the fracture at some point where stresses are concentrated by a flaw.—Page 1169.

* * *

If the tungsten-carbide tip comes off the shank, too rigid welding is to blame. The carbide and the steel have different rates of heat expansion. Copper brazing affords a soft cushion to absorb the stresses.—Page 1173.

* * *

Rate cutting may prove expensive. Bad psychological effects may nullify the money saving, for the ardor of the worker may be dampened, and the fear engendered that the rate may be cut again.—Page 1175.

* * *

Group bonus has real dangers. "It represents a deliberate shifting of the responsibilities of management to the employees," says Taylor Society head. It may easily result in the gang boss driving the group or individual members driving out weaker members.—Page 1175.

* * *

Wage incentive plan investigation reveals little uniformity. Thirty-six different plans are in operation. Many plants in the same industry use different plans. 40 per cent of employees are still working on time rates.—Page 1180.

Where scrap comes from, where it goes and how it gets there will be known when $50,000 survey is completed. Scrap Institute will unearth working facts concerning the growing scrap industry. —Page 1177.

* * *

"If you take business that belongs to somebody else, somebody else is going to take business that belongs to you," says James A. Farrell. Good business at a fair profit will be maintained if sellers curb their cupidity.—Page 1167.

* * *

Faulty design or surface corrosion is responsible for fatigue failure in three-quarters of the cases, says authority. Failures due to poor materials are in the minority.—Page 1170.

* * *

In grinding tungsten carbide, pressure on the wheel should be light, and grinding should be away from the cutting edge, to avoid chipping.—Page 1173.

* * *

"Fussiness" in attempting to value inventory down to the last penny is both foolish and wasteful. Why bother to determine within a few cents the worth of a lot of material costing only a few dollars, when it is a matter of judgment whether a machine costing $1000 shall be depreciated $50, $100 or $150?—Page 1156.

* * *

Export business shrinks. September machinery exports, valued at close to 47 million dollars, were more than 6 per cent under August, but 40 per cent over September, 1928. Total iron and steel tonnage shipped out of country in September was 9 per cent under August, but the loss was all in scrap. Rolled and finished steel gained.—Page 1215.

ESTABLISHED 1855

The Long Late Reckoning

THREE crashes in stock market prices in five days, each marked by an outpouring of securities on a scale almost beyond belief, make the reckoning for the bull movement of 1929 fairly staggering. Repeatedly in the past year it has been pointed out that the bidding up of stock prices to a basis of 1 or 2 per cent yield and the paying of 8 per cent on debit balances were conditions that could not continue for long. Yet so many counsels of experience had been cast aside, with apparent success, by the new-era prophets and so many predictions of disaster had been belied as new heights were reached, that the belief in an indefinite continuance of the bull market seemed to grow by the very illusion on which it fed.

In the confusion and semi-panic of a week so unparalleled in Wall Street history, no adequate appraisal is possible of the precipitating causes and of the extent to which business will suffer in the months ahead. Faith in a new era, in which business had been freed from major fluctuations and the fruits of increasing efficiency would pile up in dividends, was undisturbed so long as industry continued at a peak rate and corporate earnings showed an uninterrupted rise. But when the foundations of this faith began to be shaken—in part by evidence of overproduction in the automobile industry, one that touches the lives of more people than any other—the boundless enthusiasm that supported the securities boom gave way to an equally exaggerated spirit of pessimism and of distrust of stock values.

Mob psychology, as the *Guaranty Survey* points out, was accentuated by the fact that securities were in the hands of many thousands of inexperienced speculators, who were impelled into buying and selling en masse without a clear understanding of the reasons for doing so.

If advances in securities prices overdiscounted the excellent operations of industry in the first eight months of the year, it is equally true that the wholesale dumping of stocks is out of keeping with the moderate slackening of business now evident. While there is no gainsaying that the motor car industry, and possibly a few smaller activities, such as radio manufacture and airplane building, overreached themselves and are in a corrective period, business as a whole has continued at a highly satisfactory level. Moreover, cash reserves of corporations are large, the Federal Reserve ratio is double the legal minimum and unemployment is negligible.

The most unfortunate side of such a Wall Street disaster is that liquidation in stocks tends to slow up business. Much of the purchasing of consumer goods that was based on real or computed profits in securities will stop, and in many cases those who bought commodities in view of paper profits now find themselves in debt. The buoyancy of the securities market over many months has heightened the optimistic spirit that has been so outstanding in industry. It would not be surprising if under the same influence, and the prevalent confidence in the stability of commodity prices, there should have been some relaxing of the long-maintained limitation of inventories. The rate of new buying by industry in the immediate future will be closely watched for the light it will throw on this important point.

New Eyes and New Ways

NOT long ago two wide-awake members of a manufacturing firm went through a large establishment devoted to making wire. Both were surprised to find that one of the supplementary processes was done by hand and required the labor of six men. Being of an inventive bent, the two visitors at once set to work to develop a machine for doing what the six laborers had been seen to do. Resulting from this, the operation is now performed much more rapidly than before, at a mere fraction of the outlay for labor, and in the last analysis with probably little higher overhead, because the capital cost of the machine is largely offset by the release of floor space for other work.

The case is one that has been paralleled many times in American industry. All too frequently men are so occupied with thoughts of routine or so little accustomed to observing carefully and practically that golden opportunities are missed, in part, through lack of concentration or failure to challenge the existing order.

However much the man in the plant may resent the implication that some one not deeply steeped in his own lore can help him in his work, the fact remains that the independent viewpoint has been often responsible for improved practice. This does not depreciate in any way the intensive study of their problems which all managers of plants constantly make; it does very definitely suggest the value of outside thinking. Many important economies have come through the application to an industry of methods originally developed in another, and perhaps on their face not relevant to the processes of industry number one.

THROUGH the efforts of the Institute of Iron and Steel Scrap, the better element of the scrap industry, at least, appears determined to bring about better trading conditions and better practices in the marketing of this commodity, which in various ways has troubled the steel industry for many years. The

scrap institute has been functioning a little more than a year, and too much must not be expected in so short a time. Human nature can not be changed over night, nor can practices which have grown up during a generation be wiped out by any magic formula. It is a wholesome sign that the scrap industry thinks well enough of its program of self-improvement to appropriate $50,000 in addition to annual dues to undertake a rather ambitious program of research. This will take in a complete survey of the production, consumption and distribution of scrap. Some steel companies have already shown a disposition to forward the work of the institute. They have long wanted to see the buying and selling of scrap made more amenable to the standards that for the most part obtain in the market for the finished products of the steel mill.

Coal Trade Ills Not Cured

FIVE years have brought very little of the expected readjustment in the bituminous coal trade. A survey is appropriate, as reports have just been issued for 1928 on proportionate production of different sized mines and on production by districts. The convenient comparison is with 1923, the year after the great strike. The United States Coal Commission made an exhaustive report on conditions and what might be done to right the coal trade, but nothing was done by Congress and the information now available for 1928 shows that adjustment by economic laws has not gone far.

The two principal complaints were that we had "too many coal mines and too many miners" and that the United Mine Workers held the union fields up to altogether too high wages to permit competition with the non-union fields. There was a connection between the two complaints, as the excess of miners arose partly from the fact that the non-union fields had trained many men while in the union fields there was much idleness of union men who, accordingly, demanded high rates per ton to give them an annual income when they were idle about one-third of the time.

Some adjustment in the supply of miners has taken place, many union men having sought other employment. The Pittsburgh district has had a near-scarcity of miners in the last few months, although in the summer of 1927 it had the union miners idle and many new open-shop men working.

The expectation of some was that the overworking of coal properties would be corrected in time; that the large mines would thrive through economy while the small mines would die out. The report just issued, however, shows that there has been no more than a small readjustment of that sort. The percentage of the total output coming from mines producing over 100,000 tons a year has been as follows: 1913, 75.4 per cent; 1923, 70.4 per cent; 1926, 79.1 per cent; 1928, 80.1 per cent. That represents progress, but not a great deal, for five years, particularly when one considers that production decreased 11.1 per cent from 1923 to 1928, which in itself would make some small mines inactive. Mines producing 50,000 to 100,000 tons annually, really very small mines, decreased merely from 1176 in 1923 to 725 in 1928.

As to wage conditions, one finds that in general the districts complaining about high wages have lost farther in proportionate production while the districts complained about have gained. The statement is not true in all particulars, but the general swing has been that way. Below are given sets of losses and gains respectively, for districts which produced almost exactly three-fourths of the total bituminous coal in both 1923 and 1928. The total decreased 11.1 per cent and allowance for that general change is made in computing the percentages.

Pittsburgh	—27	Belleville, Illinois	—31

The United Mine Workers was largely but not wholly eliminated. It appears that there are industrial and economic conditions in the districts where it formerly thrived that keep coal mining wages far above those in the fields long non-union. In some of the formerly union fields the operators feel that they would be greatly aided by a readjustment of freight rates to a mileage basis. Long ago the railroads gave the so-called "Southern fields" low rates, on a mileage basis, in order to develop them.

Steel Demand and Automobiles

WHILE the steel industry is looking for a large total demand for its product next year, it is not entertaining any very definite expectations of the automobile industry in particular. For instance, Mr. Farrell remarked at the Institute meeting that there was probably not a fabricating shop in the country that was not booked four or five months ahead. The official statistics had already suggested such a condition; for the shops were comfortably booked at the beginning of last year, and the figures for orders and shipments in 21 months since then show an excess of more than 400,000 tons in the bookings. Lately there has been reassuring rail and freight car buying news.

Proposals involving new construction, with fabricated steel, are carefully considered and ordinarily such activity is fairly steady. Railroads aim to replace about the same amount of rails year by year and they maintain their rolling stock in much the same manner. When it comes to automobiles, however, that is a matter of popular taste if not whim. While a railroad may buy cars at a given time because it sees the shops need the business and will quote close figures, it is more likely to be the other way about with automobiles. Many men, particularly with wifely influence, are likely to buy when others are buying.

What we know definitely about automobiles is that production underwent a considerable increase in the second half of last year and had a great increase in the first half of this year. The first half of last year failed to make a new first-half record by 6 per cent, but the second half made a new second-half record by 4 per cent. Then the first half of this year made a new first-half record by 37 per cent.

On the other hand it has been impossible to develop, from the statistics of production over a period of many years, any definite cyclical behavior. Just a

few years ago there was a notion that every third year was particularly good, but there is no support for that, nor for an idea that the years merely alternate.

While the automobile industry nearly always makes sanguine predictions as to new business, it has also been stressing the fact of a large replacement market, and just at this time that argument undermines predictions of a specially large demand next year. Obviously if there is an unusually large number of replacements in one year the public has got that far ahead and will have correspondingly less occasion to replace in the following year. The accepted method of computing average life of cars, carried out in a diagram in the annual official presentation of the trade, shows average life at 7 years for cars scrapped through 1923, and 6¾ years for cars scrapped last year, involving very little difference. Replacements this year have evidently been very heavy. That does not prove that they will not be heavy next year but it raises a doubt.

It is too early to attempt to measure the effect of the stock market crash on automobile buying, but plainly it will be a factor, especially in the demand for higher priced cars.

The steel industry feels it is on safer ground in expecting a substantial continuance of general demand for steel than in counting upon anything very precise from the automobile trade.

Billion in Export Surplus

EXPORTS of merchandise from the United States in the first nine months of this year are reported by the Department of Commerce at 3849 millions of dollars, and imports at 3362 millions. This shows an export excess of 487 millions.

It happens, however, that monthly exports customarily average much heavier in October to December than in January to September. During the six years last completed the final quarters have furnished 29.6 per cent of the six years' total. On this basis the 12 months this year should furnish approximately 5450 millions in exports.

Monthly imports, on the other hand, run at about the same rate in the last three months as in the first nine months of the year, for the average for the past six years shows 25.2 per cent coming in in October-December. On this basis imports for 1929 would total 4500 millions, leaving a probable excess of exports of nearly $1,000,000,000, of which one-half will have been accumulated in one-fourth of the year.

ALONG with a domestic demand which has kept American steel mills running through the summer at a rate unprecedented in that season, there has been a growth in exports of iron and steel which has made the total the highest since 1920. Rolled and finished steel and semi-finished steel together, in the first nine months of the year, have accounted for 1,804,000 tons of outgoing product, compared with 1,568,000 tons to Sept. 30 last year, a gain of 15 per cent. Figuring tonnage of rolled products at 74 per cent of the ingot output, production of the former in the nine months has been about 32,200,000 tons. Hence, the exports have amounted to 5.6 per cent of production, a larger proportion than we have seen for some time.

Better Industrial Relations

SO much has been written of the admirable work of large corporations in the industrial relations field that the public does not realize how much some of the small companies have done. The National Industrial Conference Board, New York, in a recent survey shows that industrial relations activities have made excellent headway in smaller establishments.

Nearly as prevalent in small plants as in large ones, it appears, are the giving of bonuses for special accomplishments, profit sharing plans, group life insurance, vacations with pay, first aid and safety committees, recreational activities, employee education, and various plant conveniences. All of these can be administered without setting up special machinery and can be financed without too severe a drain upon company finances.

Company housing, lodging and home purchasing plans, however, are seldom found in small establishments, as their financial resources do not allow participation in such ventures. Because of the risk involved in operating mutual benefit societies, these organizations are found in relatively few small companies; on the other hand, many of the latter have gone into group insurance.

The survey gives convincing proof that wherever finances have permitted small plants have not hesitated to introduce activities beneficial to their employees, even though the cost per wage earner is much higher than in the large plant. Among the reasons the Industrial Conference Board gives for such work in small or medium-sized establishments are the competition with large plants for competent labor, the increased productive efficiency of a satisfied working force and the belief that it is the part of enlightened policy to keep in step with prevailing practice.

In part, at least, the rapid growth of cooperation in small plants is significant of a changed attitude of many employers toward their employees. In 1921 there was a great falling away from the unusual cultivation of employees through the elaborate personnel bureaus of the war period and some that flourished in the post-war boom of 1919-20. But there came later an appreciation that no policy could be more mistaken than that of treating the employer-employee relation as a fair weather one. The weight of evidence is plainly with the view that we have come into an era of better feeling between industrial workers and their employers.

Modern developments in the methods of microscopic investigation of metallurgical problems have consisted mainly in improvements leading to the use of high magnifications, improved methods of preparation of the surfaces, and a very much larger variety of etching reagents, which render possible discrimination between phases, which, formerly, could not be readily distinguished, according to Dr. Walter Rosenhain of the British National Physical Laboratory.

Patent Bills Reviewed by Engineering Board

At a meeting of the administrative board of the American Engineering Council, at the Hotel Mayflower, Washington, Oct. 24 and 25, more than 30 bills and resolutions pending before Congress were considered.

The board voted-to oppose the Cramton Bill, which would allow only licensed attorneys to practice before the Patent Office. Members of the board charged that the bill was an attempt on the part of lawyers to restrict the proper activities of engineers and scientists in acting as technical advisors and in other non-legal capacities in connection with applications for patents.

It was decided to favor the bill if an amendment were added to the effect that the objectionable provisions "shall not apply to engineers, chemists or other scientific persons when performing scientific, technical or other non-legal service in connection with applications for patents."

The board voted to oppose the King Bill to provide compulsory licenses for unused patents, and to indorse a bill offered by Senator King to investigate procedure in the Patent Office and offer recommendations to remedy the conditions which are responsible for the more than 100,000 patents awaiting consideration.

The board approved the recommendation of the committee on research that a group of experts be appointed to cooperate with the Bureau of Aeronautics and the Department of Commerce in making a study of the problems involved in the designing of airports.

The resolution offered in the House by Representative McLeod that a commission be appointed to study the causes and remedies of business cycles and unemployment was approved with the recommendation that the proposed committee should be under the supervision of the Department of Commerce. Other measures approved included a resolution for the establishment of a commission to plan a National Museum of Engineering and Industry, and a bill creating a Safety Division in the Bureau of Labor Statistics.

The annual meeting of the council will be held in Washington on Jan. 9-11, 1930.

Testing Society to Hold 1931 Meeting in Chicago

For some time the American Society for Testing Materials has been considering the holding of its annual meeting somewhere in the Middle West. At a meeting of the executive committee on Oct. 8, on recommendation of the committee on annual meetings, a decision was reached to hold the 1931 meeting in Chicago, June 22 to 26. The 1930 meeting will be held, as usual, at Haddon Hall, Atlantic City, N. J., June 23 to 27.

A regional meeting of the society will probably be held in March, next year, under the auspices of the Detroit members of the society. The Detroit district committee, of which Vice-President Frank O. Clements is chairman, has suggested this meeting partly for the purpose of extending knowledge and appreciation of the value and significance of the A.S.T.M. work among the automotive and related industries. For this reason a one-day meeting is planned which is to be devoted to a discussion of what the society has done and is organized to do for the automotive industry. A number of papers discussing the many activities of the society in the testing and specifying of materials used in the automotive industry will be presented at morning and afternoon sessions, followed by a dinner.

Consideration is also being given to the possibility of holding the spring group meeting of committees at Detroit for the three or four days immediately following the Detroit regional meeting.

Bar Iron Rate Unchanged

The bi-monthly examination of the books of companies subscribing to the wage agreement with the Amalgamated Association of Iron, Steel and Tin Workers discloses that the rate on bar iron for the next two months will be unchanged at 2c. a lb.

The Week in Business

Drift of Current Financial and Economic Opinion

THE "hidden" bear market rushed out of hiding, "selective" buying gave way to indiscriminate selling and "blue chip" stocks were dumped overboard with less favored issues in three days of record-breaking liquidation in Wall Street.

On Oct. 29, sales on the New York Stock Exchange were the largest in history, totaling 16,410,030 shares, and virtually wiping out all the price advances of the year. Only second to this volume was that of Oct. 25, when 12,894,600 shares changed hands, while the total for Oct. 28 took third rank, with 9,212,800 shares.

Mob Psychology at Work

Commenting on last Thursday's sharp break in values, Jules S. Bache, J. S. Bache & Co., New York, said it was "almost entirely due to the inordinate craze on the part of an indiscriminating public to buy whatever any one told them there was a profit in."

Mob psychology has always been a factor in the stock market, asserts the *Guaranty Survey*, New York, but the changed character of the investing public in recent years has greatly exaggerated psychological reactions.

"The philosophy that stocks may just as well be valued at 30 times earnings as at 10 has been for the time irreparably damaged," in the view of Alexander D. Noyes, New York *Times*.

Business Fundamentals Sound

Business is on a sound basis, although the stock market crash has sobered sentiment, according to the First National Bank of Boston. "Credit resources are ample, with interest rates on the decline. The Federal Reserve system and the member banks are in a strong position. Corporations have large cash holdings. Industrial earnings for the first nine months were higher than in any previous corresponding period. The purchasing power of the general public continues on a high level, although the stock market break may lessen the demand for luxuries. Furthermore, inventories with the exception of a few lines are on a conservative basis, and the trend of commodity prices has been gradually downward."

The absence of commodity price inflation and swollen inventories, together with a high Federal Reserve ratio, are among the most important factors distinguishing the present situation from that of 1920, in the eyes of the Alexander Hamilton Institute. The Reserve ratio, at 74.5 per cent (Oct. 23), is nearly double the legal minimum, which it virtually reached in 1920.

Some Slowing Down of Trade Predicted

A growing realization that abundant credit is available for industrial or financial purposes and that business conditions are generally sound will limit further liquidation of the stock market, in the opinion of the Harvard Economic Service.

While agreeing that underlying conditions are good, the *Commercial and Financial Chronicle* points out that stock market profits led to extravagant spending and extravagant living. "All this will have to be changed and unquestionably will involve a considerable slowing down of trade."

Iron and Steel Markets

Steel Trade Calm After Stock Crash

Adverse Effects Not Overlooked But Compensating Factors Are Seen—Fabricating Awards Large—Pittsburgh Scrap Unchanged for Third Week

STOCK market liquidation has not materially disturbed sentiment in the iron and steel trade. Feeling secure in the knowledge that it has been free from inflation, in sharp contrast with the securities market, the industry shares the confidence of its leaders, Messrs. Schwab and Farrell, in the fundamentally sound condition of business.

Although aware that steel demand may be affected by Wall Street losses, particularly in requirements of manufacturers of consumer goods, the trade is not disposed to exaggerate that possibility. In the same calm spirit the situation is being carefully surveyed with an eye to favorable results that may ensue, with particular attention to the release of construction work of the type that has been held back by high money rates.

Heavy construction, which has been at a record rate throughout the year, had another good week in terms of fabricated steel awards, which totaled 55,500 tons, compared with 58,000 tons a week ago. Fabricating shops are booked for four to five months and, although the season is near when lettings normally decline, the list of pending projects has been augmented by inquiries for 43,000 tons.

Mill bookings in ship steel have been increased 25,000 tons by the award of two Matson Line vessels to the Fore River yards of the Bethlehem Steel Corporation. Atlantic Coast shipbuilding yards, according to James A. Farrell's recent address before the American Iron and Steel Institute, have enough work to occupy them for six months.

Rail orders for the week total 45,000 tons, of which 40,000 tons was placed by one large Western road. The railroad equipment market is featured by an inquiry from the Rock Island for 5000 cars, calling for 45,000 tons of steel, a purchase of 400 refrigerator cars by the Pacific Fruit Express and orders for 100 locomotives distributed by the Pennsylvania.

Steel specifications from railroad equipment builders are improving as a result of recent purchases by the carriers, and manufacturers of tillage machinery are making heavier drafts on the mills. A relatively uniform flow of steel orders is coming from a wide circle of miscellaneous buyers, although in a few lines, such as radio manufacture, curtailment is reported.

Some slight improvement over present steel shipments to the automobile industry is indicated for November, but signs of a general stepping up in motor car production next month are still lacking.

Price developments in finished steel are unimportant, aside from a decline in plates to their customary position of parity with bars and structural shapes.

Heavy melting steel scrap for a third week is unchanged at Pittsburgh and old material markets generally are lethargic, although heavy melting grade has receded 25c. a ton at Chicago.

Steel ingot production seems to be reaching a point of equilibrium. The operations of both the United States Steel Corporation and the Bethlehem Steel Corporation are at 82 per cent of capacity. The output of independents chiefly dependent on the automobile industry has given further ground, this being notably true in the Valleys, where operations now range from 65 to 70 per cent. The general average for the Pittsburgh, Chicago and Birmingham districts is 80 per cent.

Among finishing mills, sheet plants have further reduced their output to an average of 60 per cent. On the other hand, rail mill schedules have been increased at both Pittsburgh and Chicago.

Pig iron buyers are not yet manifesting much interest in first quarter needs. More surplus steel company iron is finding its way into the market, although as yet it has not seriously disturbed prices. Shipments to automobile foundries remain light, but deliveries to other melters are fairly well sustained. The Ford Motor Co., which recently bought 17,000 tons of basic iron and 16,000 tons of high-silicon malleable, is in the market for 10,000 tons additional of the latter grade.

October sales of machine tools will exceed the September total by a comfortable margin.

Machinery exports in September, at $46,984,546, were 6.2 per cent lower than in August. Iron and steel exports last month, at 222,408 tons, showed a decline of 8 per cent from August and 2½ per cent from September a year ago.

Our European reports indicate that foreign steel markets are quiet, with prices weakening.

THE IRON AGE composite price for finished steel has declined to 2.362c. a lb., a new low mark for the year, comparing with 2.369c. last week and a year ago. This is the first time in 1929 that the composite has been below its level on the same date in 1928. Pig iron is unchanged at $18.38 a ton.

Pittsburgh

Steel Industry Still Curtailing Operations—Ingot Output Averages Below 80 Per Cent

PITTSBURGH, Oct. 29.—The steel industry in this district is still in a process of curtailment. The serious break in the stock market has had a temporarily paralyzing effect on business, even though it would be difficult to distinguish any signs of basic disorder. October has been a bad month for most steel makers, and no mills have been able to avoid sharp declines in operations.

Ingot operations in the district average less than 80 per cent this week and in the Valleys the rate has dropped to about 70 per cent. Finishing mills are also running slower, with the most marked curtailment in the sheet departments. A 50 per cent rate is not uncommon with companies making high-finished and special sheets. However, stepping up of rail mills is improving the rate of one mill in the district, and structural and plate units are still on comparatively high schedules.

The automobile industry continues to occupy the attention of many sellers of steel, but it is not easy to see any general improvement in that direction. Specifications for November are already sufficient to promise a slight improvement over October in shipments. Other consuming industries continue to take material at a good rate. The railroads served by mills in this district have not been active buyers in the past week, but heavy tonnages placed earlier in the month aided mill order books materially at a time when they needed business rather badly.

In the face of the present unsatisfactory conditions, prices have been fairly well maintained, and, where definite reductions have come about, recent quotations seem to be fairly strong. Bars and shapes and finally plates are becoming established at 1.90c., Pittsburgh, but on all three products 1.95c. is still asked on carload lots, and some business is being taken at that figure. On wire and wire nails, which have declined most sharply, price levels established last week have been successfully tested on small lots. Sheet prices are fairly firm, weakness being reported only on galvanized material in sales to jobbers. Some large makers have definitely stopped allowing the $2 differential to the jobbing trade on galvanized sheets, and 3.50c., Pittsburgh, is still representative of the market. Makers of strip steel are resisting the pressure of buyers for lower prices, and quotations on cold-finished steel bars do not seem to be in question.

The pig iron market is unusually quiet, but shipments are fairly good and prices are not definitely lower.

Scrap is also dull, but conditions are somewhat better than they were at the beginning of the month and prices are unchanged for the third week.

Pig Iron.—Recent sales of basic iron in this district have disturbed the market slightly, but investigation tends to confirm that the Valley furnace price is still quotable at $18.50. A Verona, Pa., steel foundry is reported to have bought 2000 tons of

basic iron at a delivered price of $19.76, which would amount to a slight concession on the part of local sellers. However, Valley furnaces did not share in this tonnage, and one seller definitely refused to meet that price. The Edgewater Steel Co., Oakmont, Pa., apparently has not yet bought iron, although the company has been reported in the market for two or three weeks. Sales of foundry iron are few and far between, and there is little or no inquiry. The same thing might be said of malleable and Bessemer, and lots of car loads or slightly more, which have recently been sold, have brought the full price of $19, Valley, and $19.50, local furnace. Shipments during October have been fairly good, but in nearly all cases have exceeded sales. This is causing furnaces to accumulate a larger yard surplus than they carried during the summer, but stocks are still comparatively low.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.00

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel. — Sales are practically at a standstill, although occasional spot tonnages are being bought from time to time by small users. On business of this kind the price on billets, slabs and sheet bars is holding at $35, Pittsburgh or Youngstown, but it seems that the list of preferential customers who ordinarily buy at a slight advantage in price has been extended for this quarter. In some cases, customers who have been paying the full market price were never forced to pay $35 for their steel when the market was advanced to this price last summer, and these buyers are still getting their old price. Forging billets are unchanged at $40 a ton, and this price seems to be holding fairly well. Wire rods are quiet at $40, Pittsburgh or Cleveland.

Rails and Track Accessories.—Following a week of considerable activity, this market is now quieter. As most of the larger roads served by Pittsburgh mills have bought their rails and track accessories, market interest is again centered on the rate of specifications. The Baltimore & Ohio has not announced its 1930 requirements, and may come into the market in the near future. Operations are rather light, but rail mills are stepping up their schedules and will be at capacity within another month.

Bars, Shapes and Plates.—Plates and shapes are still finding a good demand, but bar business is not improving as much as had been expected. Cold-finishing mills are at a low rate, and, with their hot bar requirements considerably curtailed, one of the best outlets for merchant bars is seriously hindered. Business in reinforcing bars is also declining seasonally, and deliveries are now rather prompt. On plates and shapes deliveries average from two to three weeks, with a month required for some special rollings. Railroad car builders in this district are beginning to step up their requirements, although recent buying of cars will not increase their operations to any great extent for several weeks. Barge builders need business, but prospects are very good and most barge builders feel that new orders will be placed before present work is completed. Fabricating shops are well engaged, but large jobs in this territory are slow in coming out. Prices are still somewhat unsettled, but bars and shapes are holding at 1.90c., and the tendency toward shading prices is not so pronounced as it was a few weeks ago. Plate prices are still somewhat stronger than those on bars and shapes, but the 1.90c. figure is appearing more frequently.

Wire Products.—Nail prices are better established as a result of the recent reduction of $1 a ton, and the $2.40, Pittsburgh, quotation to large buyers is now being adhered to on new business. Some companies have contracts on their books at lower figures, but are determined to hold the price on new tonnage. Demand for manufacturers' wire is unfavorably influenced by lack of buying by automobile companies, and jobbers are taking annealed wire only in small tonnages. The wire price is unchanged at 2.40c. to 2.50c., Pittsburgh, the higher figure applying on carload lots.

Tubular Products.—Pipe mills are still reasonably active, but backlogs are low, and, with current demand seemingly on the decrease, it is likely that further curtailment in operations will soon be necessary. During the month operating schedules have been stepped down as much as 10 points, principally in the butt-welding departments. The trade is still interested in the large line pipe projects which are being talked of and there is a possibility that the proposed line from the Texas fields into Chicago may be let early next month. If not, the project will likely be postponed until after the first of the year. Demand for seamless pipe is holding up better than for the welded products. Shipments of mechanical tubing have declined sharply during the month, but there are prospects of some improvement in November.

Sheets.—Sheet mills curtailed operations last week, and with the leading interest running at about 75 per cent of capacity, the average for the industry has fallen under 70 per cent. Mills making high finished and special sheets are most affected, and one company is only running one of its plants every other week. However, metal furniture sheets are moving steadily, with most consumers operating their plants at close to capacity. Automobile tonnage for late November shipment is coming to local mills and, as most of this is material which will go into new models, the prospects for resumed activity in Michigan plants is somewhat better. This is not a busy season for makers of electric refrigerators, but their requirements have held up better than in former years. Prices seem to be established at recent levels, but there is still occasional shading where large buyers are concerned. Black sheets are selling in the Detroit area at less than 2.75c., Pittsburgh, in some instances, but most of this material takes heavy extras and is hardly a price criterion for the market. Jobbers are able to buy galvanized sheets at 3.40c., Pittsburgh, but the 3.50c. quotation to the

No. 24, 8-lb. coating, f.o.b. mill	4.00c. to 4.10c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C. $11.20	25-lb. coating I.C. $16.70
15-lb. coating I.C. 14.00	30-lb. coating I.C. 17.75
20-lb. coating I.C. 15.30	40-lb. coating I.C. 19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers	Alloy	Differential
2000	(1½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	28	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discounts of 5% and 2½%, and on galvanized by 1½ points, with supplementary discounts of 5% and 2½%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

manufacturing trade is holding. Large makers of blue annealed sheets have not recognized reported price shading on this product and are still quoting 2.35c., Pittsburgh, for the No. 13 gage and 2.20c. for the No. 10. Wide strip competition continues to be troublesome, but sheets rolled on the continuous mills cannot always be substituted for the jobbing mill product, and on this business the prices mentioned above are holding.

Tin Plate.—Conditions have not changed materially in the last week, but the leading interest has curtailed its operations rather sharply, and the average for the industry is now not above 60 per cent. Further slowing down is not expected, as most companies will begin to roll 1930 tonnage some time next month.

Strip Steel.—Sentiment in the strip industry is slightly better, but business has failed to show any marked improvement. A few makers of automobile parts and accessories have increased their specifications, but the automobile industry as a whole is not yet coming back to the extent which was expected earlier in the month. Other large users of strip steel are still taking normally heavy shipments, although one exception is the radio industry, which is ordinarily a fairly large consumer. Hardware makers are busy. Strip mills are operating between 50 and 60 per cent of capacity. The price situation continues fairly satisfactory. Shading on both hot and cold-rolled material is reported occasionally, but makers usually have difficulty in checking up on irregularities. Not many attractive tonnages are coming out on which price concessions might be expected and lower quotations on small tonnages would force the smaller independent makers of strip to operate at a loss. Hot-rolled strip is unchanged at 1.90c. to 2c., Pittsburgh, and cold-rolled at 2.75c.

Coal and Coke.—The coke market continues to show some improvement, but prices have not advanced and the furnace grade is still quotable at $2.65 to $2.75, Connellsville. An increasing volume at the higher figure is reported. The H. C. Frick Coke Co. is now operating less than 100 ovens in the Connellsville region, having put out about 3000 in the last month or six weeks. Demand for domestic coke is not so strong as it was a week or two ago, but is expected to improve with colder weather. Foundry coke is not active, but shipments are keeping up fairly well and prices have developed no further weakness.

Old Material.—The scrap market is exceedingly quiet and, although sentiment is not particularly good, prices are not quotably lower on the principal grades. No sales of heavy melting steel to mills have been reported, and dealers are sometimes paying as much as $17 to cover old contracts. Carload lots are occasionally picked up at lower prices. Hydraulic compressed sheets are nominally unchanged, although a bid of $17 at a Michigan automobile plant last week failed to take the tonnage offered. Occasional small sales to mills are reported. The light grades are very quiet, and the rather brisk market for short shoveling steel turnings, which existed during the summer, is now a thing of the past. Specialties are comparatively strong, as steel foundry operations are heavy and shipments are keeping up regularly. The same can hardly be said of shipments to steel plants, as operations are not improving and hold-ups are still effective at least two points. The monthly scrap list of the Baltimore & Ohio Railroad contains 23,000 tons, including 5000 tons of heavy melting steel and 6000 tons of rails.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.25c.
Hoops	4.25c.
Black sheets (No. 24), 25 or more bundles	3.80c. to 3.90c.

Wire, black soft ann'l'd base per 100 lb	$2.90 to 3.00
Wire, galv. soft, base per 100 lb.	2.90 to 3.00
Common wire nails, per keg	2.80 to 2.90
Cement coated nails, per keg	2.95 to 3.05

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.00 to $17.50
No. 2 heavy melting steel	15.00 to 15.50
Scrap rails	16.00 to 16.50
Compressed sheet steel	16.75 to 17.25
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels	15.50 to 16.00
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.00 to 12.50
No. 2 railroad wrought	17.00 to 17.50
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.50 to 21.00
Railr. coil and leaf springs	20.50 to 21.00
Rolled steel wheels	20.50 to 21.00
Low phos. billet and bloom ends	21.50 to 22.00
Low phos., mill plates	21.50 to 22.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	19.00 to 20.00

Reinforcing Steel

Awards of 5600 Tons and New Inquiries for 900 Tons

REINFORCING steel awards in the week totaled about 5600 tons, the largest job, 1300 tons for grade elimination work for the Long Island Railroad, going to the National Bridge Works. Only a few new projects, totaling about 900 tons, were reported. Awards follow:

BOSTON, 300 tons, hotel, to Northern Steel Co.

WILMINGTON, DEL., 100 tons for Homeopathic Hospital, to McClintic-Marshall Co.

CAMBRIDGE, MASS., 200 tons, Harvard University tunnels, to Concrete Steel Co.

EVERETT, MASS., 100 tons, Warren Foundry & Pipe Co. foundry, to Barker Steel Co.

LONG ISLAND RAILROAD, 1300 tons, grade crossing elimination work in Newark, N. J., to National Bridge Works.

NEWARK, N. J., 250 tons, building for National Biscuit Co., to White Construction Co.

BUFFALO, 103 tons, part of new City Hall job, to Buffalo Steel Co.

SOUTH BEND, 150 tons, I. & M. garage, to Concrete Engineering Co.

MUNDELEIN, ILL., 150 tons, seminary building, to an unnamed bidder.

CHICAGO, 900 tons, Wieboldt store and apartment building, to Concrete Steel Co.

CHICAGO, 400 tons, apartment building at Fifty-second and Blackstone Streets, to an unnamed bidder.

RACINE, WIS., 100 tons, apartment building, to Calumet Steel Co.

PORT ANGELES, WASH., 600 tons, pulp plant for Olympic Forest Products Co., to Pacific Coast Steel Co.

OLYMPIA, WASH., 101 tons, bridge over North River, to Pacific Coast Steel Co.

LOS ANGELES, 800 tons, office building, Wilshire and La Brea Avenues, to Blue Diamond Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

CINCINNATI, 130 tons for new St. Williams' Congregational Church; bids are being received.

CHICAGO, 160 tons, Howard Trust & Savings Bank building.

CHICAGO, 100 tons, Swedish Engineers' Club building.

CHICAGO, 400 tons, footings for Lawson Memorial Y. M. C. A. building.

WHITTIER, CAL., 100 tons, mausoleum; bids being taken.

SEATTLE, 200 tons, Fourteenth Avenue South bridge; Puget Sound Bridge & Dredging Co., low bidder on general contract.

SEATTLE, 363 tons, approach to West Spokane Street bridge; general contract to General Construction Co.

Lumber for the bulkhead and dock on the Chelsea River being built for the projected cast iron pipe foundry of the Intercontinental Pipe & Mining Co. at Chelsea, Mass., is to be delivered next week. The dock and dredging in the river are expected to be completed by the end of November to permit the landing of barges with building material and equipment for the proposed foundry.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and under 10-in., Pittsburgh	$35.00
Rerolling, 4-in. and under 10-in., Youngstown	35.00
Rerolling, 4-in. and under 10-in., Cleveland	35.00
Rerolling, 4-in. and under 10-in., Chicago	37.00
Forging quality, Pittsburgh	40.00

Sheet Bars

(Open Hearth or Bessemer)

	Per Gross Ton
Pittsburgh	$35.00
Youngstown	35.00
Cleveland	35.00

Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Railroad Needs and More Liberal Orders from Farm Equipment Makers Help to Steady Steel Demands

CHICAGO, Oct. 29.—Railroad needs in rails and car equipment again feature the Western iron and steel market. Additional rail tonnages are in the making, and, in the meantime, releases against recent contracts have reached producers, who have stepped up rail production to 80 per cent of capacity. The Rock Island will make use of 45,000 tons of steel for the superstructures of 5000 freight cars, which will soon be purchased. The Missouri Pacific and other Southwestern railroads are named as probable buyers of new equipment.

New orders for finished steel are well balanced among the various products, and the total is little affected by new rail business. Releases against past obligations portray a steady inflow of specifications which assures continuance, for the time being, of operations at 80 per cent of ingot capacity. Sentiment in the local market leans toward a uniform demand for steel over the remainder of the year.

Increased use of car materials, heavier releases for rails and more liberal requisitions by farm implement manufacturers give promise of steadying demand at a time when inventory-taking threatens to curtail shipments. An encouraging feature of current business is the relatively uniform flow of orders from miscellaneous manufacturers, who individually are not large purchasers. Farm implement manufacturers are finding demand for tillage machinery well above expectations.

Pig Iron.—Melters of Northern foundry iron are coming into the market more freely, some making commitments for November, December and January shipment, while a few are placing orders for delivery over the first quarter of next year. The curve representing shipments by local sellers is tending upward. The charcoal iron market is spotty, with occasional tonnages being taken below $24 a ton, furnace. Scattered lots of Southern iron are said to have been disposed of at $13 to $13.50 a ton, Birmingham. It is reported that some sellers are willing to consider first quarter tonnages at $13.50 a ton, Birmingham. A Joliet melter will buy 1000 tons, part of which will be Southern and part Northern iron.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon. 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Sheets.—Hot mills in this district are operating at 85 per cent of capacity, and current specifications are ample to support this rate. New buying at present quotations is less active than a week ago, and order books are shrinking. Few orders are being entered beyond the immediate needs of consumers. Deliveries of blue annealed sheets range from three to four weeks, while other grades may be had promptly. Jobbers are finding a well sustained demand for all grades of sheets. Container manufacturers are ordering freely, but the roofing trade has passed the peak of its fall production schedule and specifications from this source are tapering sharply.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—New contracts for cast iron pipe are measurably larger from widely scattered points in this district. The National Cast Iron Pipe Co. will furnish 44,000 ft. of 8-in., 2500 ft. of 6-in. and 6000 ft. of 4-in. for O'Fallon, Ill. James B. Clow & Sons will ship a tonnage of cast iron pipe to Grosse Isle, Mich., and the McWane Cast Iron Pipe Co. will furnish 18,000 ft. of 6-in., 500 ft. of 8-in., 5000 ft. of 4-in. and 3000 ft. of 2-in. pipe for Cedarville, Ohio. Among fresh inquiries are 300 tons of 6 and 12-in. pipe for Glenview, Ill., and 8600 ft. of 6 and 8-in. for Birmingham, Mich. Genoa, Neb., will open bids Nov. 8 on 9000 ft. of 8-in. pipe. The C. W. Rolling Co., Des Moines, Iowa, has been awarded a general contract to lay 5000 ft. of 6-in. pipe at Indianola, Iowa.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Plates.—The outlook for increasing demand for plate mill products is brighter than it has been in the last four or five weeks. The railroad equipment field continues strong and prospects for added business in the oil producing centers of the West are bright. The Rock Island has come into the market for 5000 cars, which will require about 45,000 tons of steel. The Burlington announced a week ago that it would buy 600 cars and build a like number in its own shops. It is now reported that the car program being undertaken by this railroad calls for 2200 cars, of which about half will be let out on contract and the remaining 1100 will be built in the railroad's shops. The Missouri Pacific, which early in the year placed large orders for cars, expects to enter the market again about Dec. 1, when it will take figures on cars that are specified in the 1930 budget. Inquiries are out for 18 baggage and mail cars for the St. Louis-San Francisco and the Wabash. It is reported from St. Louis that inquiries for cars are being shaped by several Southwestern railroads. Greater interest in the conservation of oil and gas reserves gives promise that the petroleum industry will draw more heavily against steel mill commodities. Several odd-lot orders for tankage plates total 1500 tons for shipment to fabricators in the Southwest. Fresh inquiry from the same direction totals 7500 tons. It is interesting that current business of this kind is coming from widely scattered sources and in smaller individual lots than has been characteristic of oil producers' and refiners' needs in recent months. Manufacture of electrically welded pipe continues to take sizable tonnages of plates. Prices for plates remain steady at 2.05c. a lb., Chicago. Deliveries range from three to four weeks except when orders match rolling schedules.

Rails and Track Supplies.—After a delay of one week, releases against 1930 contracts for standard-section rails have reached mills and output has been advanced to 80 per cent of capacity. As to sales, this market is drifting quietly while sellers await inquiries which are expected from several Western railroads. Orders for track fastenings cover only needs for current maintenance programs. Demand for light rails is improving. The bulk of the tonnage placed is reported to have been taken by mills in Pennsylvania.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Ferroalloys.—This market is quiet. a carload of spiegeleisen, in the 19 to 21 per cent grade, has been sold at $34 a ton, Hazard, Pa. Quotations on 50 per cent ferrosilicon are $83.50 a ton for future and $88.50 a ton for spot business.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Bolts, Nuts and Rivets.—Releases for these commodities are larger from manufacturers of farm machinery, the railroads and car builders. After several months, in which producers have been balancing stocks, they now find that, at 60 to 65 per cent of capacity, shipments about match output. Total shipments in October are smaller than in the same month a year ago.

Reinforcing Bars.—Awards of reinforcing bars total above 1600 tons for the week. Fresh inquiry is not large and dealers are not entertaining high hopes as to the volume of business that will be closed this fall. Nevertheless, the thought is expressed by sellers that the strengthening of the bond market is a factor which can be expected to stimulate building programs and in turn increase demand for reinforcing bars. Sales for the first 10 months of 1929 are variously reported at 10 to 20

per cent below the corresponding period a year ago. Order books are a shade lighter than in October, 1928, and inquiries hold less promise than at this time a year ago. Lower levels of prices through most of this year have narrowed profits. Quotations remain mixed as competition waxes keen for tonnages that are active.

Cold-Rolled Strip.—Prices for this commodity are steady in a market which is unusually dull both in sales and releases against old commitments. Consumers have given no indications that their needs will be greater in the near future.

Wire Products.—Output of wire mill products ranges from 50 to 60 per cent of capacity in the various mills in this district. Demand from jobbers is holding steady, even in the Northwest, where winter weather is soon to be expected. Shipments of woven wire fencing are a shade larger to widely scattered parts of the country. The manufacturing trade as a whole specified a smaller aggregate tonnage of wire and wire products than it did in the previous week. The disposition of most consumers is to buy at close range. Stocks in the hands of users and jobbers are small, this evidently being a satisfactory situation in view of the prompt service being given by mills.

Old Material. — Specialties and heavy tonnage grades of scrap are tending to pull away from each other both in volume of demand and strength of prices. Consumers of the heavy tonnage grades are curtailing shipments at a time when supplies are expanding. Strict inspections by mills have forced dealers to pay close attention to the preparation of scrap and, by the same token, there is accumulating in this district a sizable tonnage of scrap steel which will not meet the rigid regulations imposed by consumers. Some large buyers give evidence of having accumulated satisfactory stocks. Dealers continue to press for sales and, meeting stiff resistance from consumers, are accepting prices that range from 25c. to 50c. a ton below quotations of a week ago.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	1.90c. to 2.25c.
Reinforc'g bars, rail steel	2.00c.

No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	2.95
Cement c't'd nails, base per keg	2.95

Several thousand tons of heavy melting steel has been taken by a mill at $14.50 a gross ton, delivered. Hydraulic bundles have sold off 25c. The cast iron boring market is dull. Tonnages are accumulating at points of production and consumers show little interest even when offered this grade at $10 a gross ton, delivered, which is 50c. a ton below the figure established on the last tonnage sale. The specialty market is active and prices are well supported by a substantial volume of quiet buying. Stocks in the hands of some users are of fair size, and shipments are being closely watched. Gray iron and malleable shops are taking more scrap, the latter finding an active demand for castings by railroad equipment manufacturers. Both inquiries and purchases of electric furnace low phosphorus grades are active.

Prices deliv'd Chicago district consumers:

	Per Gross Ton
Basic Open-Hearth Grades:	
Heavy melting steel	$14.00 to $14.50
Shoveling steel	14.00 to 14.50
Frogs, switches and guards, cut apart, and misc. rails	15.75 to 16.25
Hydraul. compressed sheets	12.25 to 12.75
Drop forge flashings	10.75 to 11.25
No. 1 busheling	12.25 to 12.75
Forg'd cast and r'l'd steel carwheels	18.50 to 19.00
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.25 to 14.75
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	12.00 to 12.50
Cast iron borings	9.50 to 10.00
Short shoveling turnings	9.50 to 10.00
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	16.75 to 17.25
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	19.50 to 20.00
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

	Per Net Ton
Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	20.50 to 21.00
Iron car axles	26.00 to 26.50
Steel car axles	17.00 to 17.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	12.50 to 13.00
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.75 to 11.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Bars.—Both specifications and sales of mild steel bars have made good accounts of themselves in the last week. New business is coming from a wide circle of miscellaneous buyers. Manufacturers of tillage machinery are finding demand in excess of expectations and their tendencies are to expand operations. Prices for iron bars are quotable at 2c. to 2.05c., Chicago. Demand is steady from manufacturers of railroad equipment. Output of alloy steel bars ranges from 60 to 65 per cent of capacity. This commodity is rapidly gaining favor with manufacturers of farm implements, who are steadily taking larger quantities. For the first time in over a month, specifications for rail steel bars have fallen below shipments. New sales are dull, but on going business prices are holding at 1.95c., Chicago Heights.

Structural Material.—Greater activity in this market is indicated more by the volume of new work in architects' offices than by actual awards and new inquiries. Contracts for the week total 3400 tons, and fresh requests for prices aggregate 8600 tons. Specifications for structural materials are well ahead of the volume a week ago. The bulk of this material was ordered out by car builders. Prices obtained by fabricators still reflect a highly competitive market. Mills are asking 2c. to 2.05c., Chicago.

Mill prices on plain material, per lb.: 2.00c. to 2.05c. base, Chicago.

Detroit Scrap Unchanged

DETROIT, Oct. 29.—There have been no changes in prices on old material in this district.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$13.75 to $14.25
Borings and short turnings	8.25 to 8.75
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	11.75 to 12.25
Old No. 1 busheling	10.25 to 10.75
Sheet clippings	8.00 to 8.50
Flashings	12.25 to 12.75

Railroad Orders Car and Ship Unloaders

Hocking Valley Railroad Co. has awarded contracts to Wellman-Seaver-Morgan Co., Cleveland, for three 17-ton stiff-leg ship ore unloaders, and to Industrial Brownhoist Corporation, Cleveland, for two 120-ton lifting turning car dumpers, for installation at Presque Isle, Ohio.

The dumpers will be located on one side of a slip and will be capable of handling over 60 120-ton cars an hour, and the ship unloaders will be on other side of slip. Electric pusher locomotives will be installed on both coal and ore piers for handling empty and loaded cars. The ore and coal dock will provide a new channel for the flow of Great Lakes ore and West Virginia coal.

Three large substations will be installed for supplying power to the development. A contract for electrical equipment has been let to Westinghouse Electric & Mfg. Co., East Pittsburgh.

New York

Pig Iron Inquiry for First Quarter—Steel Buying Shows No Recovery—Structural Awards Large

NEW YORK, Oct. 29.—Pig iron sales for the week, at 9000 tons, compare favorably with recent totals, although one transaction — the purchase of 5000 tons by a Connecticut melter—accounted for more than half of the aggregate. The Thatcher Co., Newark, N. J., has not yet closed on its inquiry for 3000 tons. The A. P. Smith Mfg. Co., East Orange, N. J., is in the market for 300 tons of No. 2X and No. 2 plain for first quarter, and another inquiry for that delivery calls for 1000 tons. Otherwise, interest in first quarter is confined mainly to tentative inquiries. Melt is holding up well and pressure for shipments of iron is unabated. The price situation shows some unsteadiness along the seaboard, where Buffalo, eastern Pennsylvania and Southern water-borne irons meet in competition.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Cast Iron Pipe.—Northern foundries are endeavoring to maintain pressure pipe prices at $32 to $34 a ton, f.o.b. foundry, but occasional sales are still made at delivered prices figuring back to about $31, f.o.b. foundry. The Sinclair Refining Co., New York, has awarded about 450 tons of pipe for a new refinery at Wellsville, N. Y., to the National Cast Iron Pipe Co. The Federal Water Service Corporation, New York, has closed on 200 tons of 24, 30 and 36-in. water pipe for Chester, Pa., and the West Virginia Pulp & Paper Co., New York, has bought 100 tons of 12 to 24-in. pipe and fittings for Piedmont, W. Va. Municipal buying is limited to lots of a carload or less and not much activity is expected until after election, when some of the usual purchasing for winter delivery is expected by sellers.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Finished Steel.—Recovery in steel buying may be hampered by the effects of the startling break in security values. While business conditions remain fundamentally sound, the steel trade does not overlook the fact that buying of the substantial character necessary to support high steel works operations is based to a considerable degree on confidence, which may be shaken by the events of the past week. It is too early to say that stock market happenings have had an effect on steel buying, but the situation is being watched closely. The past week has brought no improvement in the volume of steel bookings. Some local sales offices have done better in October than in September, but with others the total tonnage this month will fall below that of last month. Plate mills, which until recently have been well buttressed with orders, are now working almost hand-to-mouth. Building construction remains one of the outstandingly favorable factors, and it should be helped by the easier money conditions now prevailing, although the season is near at hand when lettings normally fall off. Awards of structural steel in the New York district, however, were high during the week at about 35,500 tons and almost 20,000 tons of new inquiry appeared. Of the awards, 13,200 tons was for subway construction, which also contributes 12,300 tons to prospective business. The Salmon Tower Building, Fifth Avenue and Forty-second Street, requiring 9300 tons, has been awarded. Both of the largest awards of the week, totaling 22,500 tons, went to the McClintic-Marshall Co. Two apartment buildings totaling upward of 11,000 tons have come into the market.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.22½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Reinforcing Bars.—The National Bridgeworks will supply 1300 tons of bars for grade crossing elimination work on the Long Island Railroad at Jamaica, N. Y. The volume of small jobs ranging from 25 to 75 tons has fallen off considerably. However, prices are firm and unchanged.

Warehouse Business.—Buying continues small, but prices are stable except for the tendency to grant concessions of $1 to $2 a ton on black and galvanized and as much as $5 and $6 a ton on blue annealed sheets. Demand for structural material is fair, but tonnages being sold from stock are beginning to decrease in size.

Coke.—Prices are unchanged in a quiet market. Standard furnace coke is quoted at $2.75 a net ton, Connellsville, and special brands of beehive coke are unchanged at $4.85 a net ton, ovens. Beehive foundry grade is quoted at $8.56, delivered to northern New Jersey, Jersey City and Newark and $9.44 to New York and Brooklyn. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Stocks of scrap in consumers' yards are not believed to be large, but in most cases mills are confining their purchases to a few carloads at a time, or are pressing for delivery of scrap due them on old contracts. Prices are substantially unchanged, with No. 1 heavy melting steel being bought at $15 to $15.50 a ton, delivered eastern Pennsylvania, and No. 2 steel at $11.50 to $13.50, de-

Aluminum Cans Being Tried in Norway

An experiment with the object of replacing tin with aluminum in the canning of foods is being made in Norway, according to information from Norwegian sources transmitted to the Department of Commerce by Commercial Attaché Marquard H. Lund at Oslo. At present the experiment is limited to canned fish. Fifty thousand aluminum cans have been made up and used for canned fish balls and other fish products, part of which has been exported.

Against a price that is considerably higher than tin, mention is made of saving the expense of a printed label, as aluminum may be embossed because it does not rust.

A Norwegian aluminum company is supplying the aluminum for these experiments and is backing the project. Plans are being made for the installation of rolling equipment at the company's plant at Hoyanger for the special gage sheets required.

With sales already 20 per cent greater than in all of 1928, itself a record year, the Electric Tramrail division of the Cleveland Crane & Engineering Co., Wickliffe, Ohio, expects 1929 to surpass 1928 by about 50 per cent. The heavy crane division and the welding department are both running considerable night forces.

Cleveland

Further Slowing Down in Mill Operations, Particularly in Sheets—No General Automotive Upturn in Sight

CLEVELAND, Oct. 29.—Demand for finished steel during the past week held up to about the recent volume except for sheets, which are unusually slow following a recent rather limited spurt of orders from the automotive industry. Manufacturing plants not affected by the slowing down of the automotive industry are keeping up their operations at a fair rate, but practically all their orders for steel are for small lots.

While the automotive industry has made some purchases of steel bars, strip and sheets for November requirements, the demand from that source continues to drag. There are as yet no indications of a general increase in production schedules by automobile manufacturers during November.

There has been some further slowing down of mill operations. Some of the sheet mills in this territory are operating at not over 25 per cent of capacity, although the average is probably around 50 per cent. Some of the hot-rolled strip mills are somewhat under 50 per cent. Local bar mills have not reduced operations materially.

There is very little of interest in the price situation. Steel bars have settled to the recently quoted minimum Cleveland base, and there is some pressure against the 1.95c., Pittsburgh base on structural shapes and plates.

Pig Iron.—Foundries, as a rule, are taking little interest in the market. Consumers in general have enough iron under contract for the remainder of the year and are not ready to buy for the first quarter. Sales fell off sharply the past week, during which Cleveland interests took orders for 10,000 tons of foundry and malleable iron, practically all in small lots. An upward trend in shipments has not materialized this month. While one producer will ship a little more iron than during September, shipping orders by other furnace interests will be about the same as last month. Consumers in manufacturing industries aside from the automotive industry are taking iron in about the usual quantities, but shipping orders from the automobile foundries continue light. There has been a slowing down recently by jobbing foundries in this territory. However, their operations are spotty, some being well filled with work and others having very little business. Prices show no change. Cleveland furnaces quote foundry and malleable iron at $19, furnace, for local delivery, and at $18.50 for outside shipment. A central Ohio foundry purchased 500 tons of foundry iron from a Valley producer during the week at $18.50, indicating that that price is being well maintained in the Valley district. In Michigan, the range from $19.50 to $20, furnace, for foundry and malleable iron still exists.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25...$20.50 to	21.00
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley.. 26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Strip Steel.—Little new business is coming out for either hot or cold-rolled strip, and specifications against outstanding contracts continue light. Mills are operating from hand-to-mouth. There is not enough activity to arouse any particular interest in prices, and the market appears to be very well maintained at 1.90c., Pittsburgh, for wide strip and 2c. for narrow and 2.75c., Cleveland, for cold-rolled strip.

Semi-Finished Steel.—Specifications from some consumers are fair and others are greatly reduced. There is no new inquiry. Shipments are being made against contracts at $35, Cleveland and Youngstown, for sheet bars, billets and slabs. A local mill continues to operate 11 of its 14 open-hearth furnaces. Wire rods are firm at $40, Cleveland.

Bolts, Nuts and Rivets.—Orders for bolts and nuts are still rather light, principally because of the rather small amount of business that is coming from the automotive industry. The October volume will be about the same as during September. The industry is operating at about 60 per cent of capacity. Rivets are in moderate demand. Prices on both lines appear to be firmly maintained.

Bars, Plates and Shapes.—Structural shapes are in fairly good demand. Plates are quiet and steel bars continue to move very slowly. Orders generally are for small lots. While there is not much inquiry for steel in the building field, small fabricators are getting considerable work in small lots and their shops are well filled. Considerable structural work is in prospect, but is being held up, evidently because of the present financial situation. Steel bars are now generally quoted at 1.90c., Cleveland.

Sheets.—The volume of sheet business the past week was the lightest in several months. However, with the recent releases of auto body sheets, some of the mills have better order books than a few weeks ago. Black sheets are moving fairly well in small lots. The market appears well stabilized at the recent range of quotations, although no lots came out during the week of sufficient size to test prices. Blue annealed sheets show ir-

regularities, being affected by both strip mill and continuous sheet mill competition. Continuous mills quote blue annealed sheets at 2.10c. and 2.25c. for No. 10 and No. 13 gage respectively, although some buyers in the automotive industry have covered at $2 a ton lower. Black sheets are firm at 2.75c., Pittsburgh, and galvanized at 3.50c.

Wire Products.—Mills have closed contracts with jobbers for nails for the remainder of the year at $2.40 a keg, Cleveland. Retailers recently have been able to buy at as low as $2.45, but an attempt is being made to stabilize prices to retailers at $2.50. Demand, which has been very slow, shows a little improvement, and mills report a slightly firmer price tone. Wire is holding to 2.40c., Cleveland. Demand is slow.

Coke.—A Valley producer has advanced by-product coke prices 50c. a ton to $5.25, furnace, for egg and to $5 for nut size. However, the nut grade is still available at $4.75. October prices have been reestablished for November on by-product foundry coke. These are $8.25, Painesville, and $6.50, Ashland. Prices on Connellsville foundry coke are unchanged. A slowing down in the foundry industry is reflected in a decline in coke specifications.

Old Material.—The market is almost at a standstill. A local consumer has suspended shipments on both steel-making and blast furnace scrap, and there is no new buying by the mills. Prices are weak but untested. While quotations are unchanged, they are regarded as nominal. Small lots of No. 1 busheling were purchased in Detroit by a Cleveland dealer at $12.25 to $12.50 for delivery to an Ohio mill.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.75 to $15.00
No. 2 heavy melting steel	14.25 to 14.50
Compressed sheet steel	14.75 to 15.25
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.50
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.50 to 11.00
Mixed borings and short turnings	10.50 to 11.00
No. 2 busheling	10.00 to 10.50
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.50 to 19.50
Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Plate and Shape Business Fair—Steel Buying Generally At Low Level—Pig Iron Quiet

PHILADELPHIA, Oct. 29.—Steel buying is limited to small orders for current requirements. Shape mills are well engaged with tonnage from fabricating shops, which are booking some good contracts despite the advanced season. Bars and sheets continue quiet, as a result of inactivity in the automotive field, and it is suggested that the recession in the stock market will be a factor in retarding recovery of the automobile business. Announcement that the plant of the Victor Talking Machine Co., Camden, N. J., is to be expanded to manufacture all radios for a new corporation, which includes the Victor Talking Machine Co., General Electric Co. and Westinghouse Electric & Mfg. Co., leads sheet sellers here to expect a considerable sales increase in this district of sheets and other material for radio building.

Pig Iron.—Prices are lacking in strength, but, with consumers of foundry iron buying only small lots, actual test of the market is lacking. The quotation of $21, furnace, however, is occasionally shaded 50c. a ton, even on small lots. Although demand is light, especially from the larger companies such as soil and pressure pipe and radiator manufacturers, shipments on old contracts are reported by sellers to be going forward without requests for delay. Basic iron is inactive, but a consumer at Claymont, Del., is showing interest in prices and is expected to inquire for a tonnage soon. The Virginia producer of pig iron goes into blast today and has booked 16,000 tons of foundry iron for shipment to the Virginia cast iron pipe makers at $17.75 a ton, furnace. On this basis, the furnace is preparing to compete for tonnage in the Cumberland Valley, to points in which it has a freight rate of $3.63 a ton.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. IX	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Specifications on contracts are small and new business is usually for less than carload lots. The price on contracts and spot business is 1.90c. a lb., Pittsburgh, or 2.22c., delivered Philadelphia.

Reinforcing Bars.—New projects in reinforced concrete involve only small tonnages of bars. One hundred tons of bars for a building for the Homeopathic Hospital, Wilmington, Del., has been awarded to the McClintic-Marshall Co. Prices of reinforcing bars are unchanged, with distributers quoting 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, with no extra for cutting to length, for billet steel bars, and 1.85c. to 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.17c. to 2.27c., Philadelphia, for rail steel bars.

Plates.—Mills are maintaining fair operating rates and have some good business in prospect from shipbuilders and the railroads. The Pennsylvania Railroad, which placed 50 locomotives with the Baldwin Locomotive Works and 25 with the Lima Locomotive Works, is to build 25 in its Altoona shops, also 100 tenders. The price of plates is unchanged at 2.05c., Coatesville, or 2.15c., delivered Philadelphia.

Shapes.—Despite a steady flow of business from fabricating shops, which are well engaged on contracts, prices of shapes show no tendency to become firmer. Quotations are unchanged at 1.90c. to 1.95c. per lb., f.o.b. nearest mill to consumer, or 1.96c. to 2.01c., delivered Philadelphia, and these prices are occasionally shaded slightly.

Sheets.—Local consumers of sheets are operating on curtailed schedules, but in the case of automobile body builders, increased output is expected when the designs for new models of two leading makes of motor cars are received. A leading radio manufacturer in this district is still operating at only a small percentage of total capacity, but sheet sellers are looking forward to increased radio consumption with expansion next year of the Victor Talking Machine Co. plant in Camden, N. J. Sheet prices are unchanged at 2.75c., Pittsburgh, or 3.07c., Philadelphia, for black sheets, and

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

3.50c., Pittsburgh, or 3.82c., Philadelphia, for galvanized sheets. Blue annealed sheets, No. 13 gage, are quoted at 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia, and blue annealed plates, No. 10 gage, at 2.20c., Pittsburgh, or 2.52c., Philadelphia. On sales to automobile builders and other preferred buyers, or when competition is encountered from the product of the continuous mill, the blue annealed sheet price is usually shaded about $2 a ton.

Imports.—In the week ended Oct. 26, a total of 1945 tons of pig iron arrived at this port from British India. Steel imports consisted of 51 tons of steel bars from France, 37 tons from Germany and 7 tons from Belgium, 44 tons of steel bands from France and 16 tons from Germany, 50 tons of structural shapes from Belgium, 10 tons from France and 7 tons from Germany, 8 tons of steel scrap from France and 2 tons from the United Kingdom.

Old Material.—All grades of scrap are quiet and prices are unchanged. Buyers of No. 1 heavy melting steel are pressing for shipments on old orders and claim to be able to buy in the present market at $15.50 a ton, delivered. Heavy breakable cast, after receding to $14.50 a ton, delivered, is slightly firmer, and consumers have been unable to buy at a lower price.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$15.50 to $16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50 to 14.00
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	14.50 to 14.75
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.50
Shafting	19.00 to 19.50
Steel axles	22.75 to 23.25
No. 1 forge fire	14.00
Cast iron carwheels	16.50
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Hyman-Michaels Co., Peoples Gas Building, Chicago, has incorporated the Hyman-Michaels Tank Line, Inc., to be run in connection with the present railroad equipment, rail, scrap iron and steel business. The new company will lease on a rental basis class 11 tank cars of all sizes. Maintenance plants will be established at East Chicago, Indiana, St. Louis, and Fort Worth, Tex. Officers of the Hyman-Michaels Tank Line, Inc., are: Joseph Michaels, president; S. E. Purdy, vice-president; E. B. Michaels, secretary; T. E. Tennis, general manager, and J. P. Morrissey, traffic manager.

Manganese Ore from Montana

Manganese dioxide, which is used in making dry batteries, has since 1918 been obtained in the United States chiefly from the Philipsburg district in Montana. The district has also produced more or less manganese oxide ore suitable for use in steel making, and recently a small shipment of Philipsburg ore was used at Silver King, Idaho, in the Tainton process of zinc extraction. The process of beneficiating the dioxide ore has produced a large quantity of manganiferous tailings, which is valuable either for reconcentrating or for fluxing. It is now being used as a flux at the blast furnace of the Columbia Steel Corporation at Provo, Utah, in the manufacture of high-manganese pig iron.

Statistics compiled by the United States Geological Survey, supplemented by figures from the Bureau of Mines, show that to the end of December, 1928, shipments of manganiferous material from Philipsburg amounted to 442,482 tons, classified as follows:

	To End of 1918, (War Period) Tons	1919-1928, Tons	Total, Tons
Crude ore (35 per cent or more of manganese)	200,079	30,700	230,779
Concentrate (about 70 per cent of manganese dioxide)	1,450	188,550	190,000
Tailings (about 20 per cent of manganese)	....	21,488	21,488
Low-grade crude ore (about 20 per cent of manganese)	....	215	215
Total shipments	....	....	442,482

On the assumption that 2¼ tons of crude ore was required for each ton of concentrate produced, it appears that in round figures 427,500 tons of ore was milled. This amount, added to the crude ore shipped, gives a grand total of 658,500 tons mined.

Electric Sponge Iron Plant in Canada

Robert Turnbull, president of the Volta Mfg. Co., Welland, Ont., who has developed a process for the reduction of iron ore by electrometallurgical methods, has with his associates, F. A. J. FitzGerald and J. Kellener, of the FitzGerald Laboratories at Niagara Falls, N. Y., secured a site at Sault Ste. Marie for the establishment of a plant to manufacture sponge iron and steel.

Two furnaces are to be built at once at a cost of $75,000, and it is understood further expenditure is contemplated. The site was secured from the Algoma Steel Corporation and construction will commence in the next few weeks.

Since the Government of Ontario plans to pay a bonus of 1c. a unit on all iron ore mined in the province and will introduce legislation at the next session of the legislature to give effect to this bonus, Mr. Turnbull's experimental work has an immediate practical interest, it is pointed out. His process would convert the ore at the mine into what he terms sponge iron. He claims that steel made from sponge iron in the open-hearth or electric furnace is of much higher quality than steel made from a mixture of ordinary steel scrap and pig iron. The proponent of the project states:

> Our work to date leads us to believe that we are working in the right direction. We have made sponge iron and we have made it from refractory ores of Canada. Our furnace design will, I believe, lend itself to a satisfactory solution of what today I think is the most important problem confronting the iron and steel manufacturer—a method of producing iron cheaply and from ore which today the blast furnace cannot handle.

The new process is said to reduce, by electricity, the low-grade iron ores to sponge iron without the use of carbon, by melting the iron content without affecting the impurities. The ore would be reduced in two separate chambers—one heated by electric resistors and the other a preheating chamber. It is claimed by those interested that not only will the process handle magnetite iron, but it will utilize all the present scrap iron, now shipped out of Canada for treatment. The reducing units are designated to be built in units of 30 tons. Definite information as to the details of the plan are not available.

Thomson and Gibb Welding Machine Companies Merge

A consolidation of the Thomson Electric Welding Co., Lynn., Mass., and the Gibb Welding Machines Co., Bay City, Mich., has been announced, the new company to be known as the Thomson-Gibb Electric Welding Co. Both plants will continue in operation.

The Thomson company was formed in 1886 to exploit the basis resistance welding patents of Prof. Elihu Thomson of Lynn, Mass. Professor Thomson has always been an officer and director of the Thomson company and will continue with the new company in both capacities. The Gibb company has specialized in seam welding.

The Thomson-Gibb Electric Welding Co. will offer a full line of butt, flash, seam, spot, protection, and wire fabric welders. It will maintain service engineers in all leading production centers.

"Methods of Test Relating to Electrical Insulating Materials" is the title of a pamphlet issued by the American Society for Testing Materials, Philadelphia. It contains all of the methods of testing such materials prepared by the society's committee D-9 and also contains the annual report of this committee, presented at the regular yearly meeting of the society at Atlantic City last June. The pamphlet also contains a few specifications prepared by other committees of the society which are of interest in electrical insulations. It contains approximately 200 pages.

Pacific Coast

Cast Iron Pipe Order of 3000 Tons Goes to France—Steel Demands Hold Up Fairly Well

SAN FRANCISCO, Oct. 26 (*By Air Mail*).—Awards of 1100 tons of structural steel shapes for an office building in Los Angeles, 600 tons of plates for a pipe line at Ashland, Ore., and 3000 tons of cast iron pipe for Ladner, B. C., were the outstanding developments of the week. Demand is holding up well and prices in most lines are well maintained.

Pig Iron.—Little of importance has occurred in the pig iron market. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar orders exceeded 1500 tons. The Blue Diamond Co. secured 800 tons for an office building in Los Angeles and the Pacific Coast Steel Co. took 600 tons for a pulp plant at Port Angeles, Wash., for the Olympic Forest Products Co. and 100 tons for a bridge over the North River at Olympia, Wash. Bids were opened on three bridge projects in Washington calling for more than 1400 tons. Bids are being taken on 100 tons for a mausoleum at Whittier, Cal. Prices on out-of-stock material in Los Angeles continue at 2.40c., base, on carload lots and at 2.70c. on smaller tonnages, while quotations in the San Francisco territory are $2 a ton lower. Merchant bar steel holds at 2.35c., c.i.f. coast ports.

Plates.—The only important award of the week went to the Beall Tank & Pipe Co., Portland, Ore., and called for 600 tons of 24-in. welded steel pipe for Ashland, Ore. During the past several weeks, demand for plates has fallen off, and the only large inquiry now before the trade involves 1400 tons for a 36 to 48-in. welded steel pipe line at Everett, Wash., bids on which were opened this week. Prices continue general at 2.35c. on the usual run of the market, with $1 to $2 a ton lower quoted on sizable tonnages.

Shapes.—Among the larger structural lettings of the week were 1100 tons for the Los Angeles Stock Exchange Building, placed with the Consolidated Steel Corporation; 400 tons for a power house at North Bend, Ore., booked by the Minneapolis Steel & Machinery Co.; and 156 tons for an apartment house at Palo Alto, Cal., taken by McClintic-Marshall Co. Numerous small projects, ranging from 30 to 60 tons, were also placed. The largest pending inquiry calls for 2400 tons for the Eleventh Street viaduct, Tacoma, Wash., bids on which have been opened. Bids were also opened on 1000 tons for the Fourteenth Avenue South bridge, Seattle, and on 243 tons for the West Spokane Street bridge approach, Seattle. Prices remain unchanged and firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe has again fallen off. Only one award of importance was reported. French interests secured 3000 tons of 2 to 12-in. Class B pipe for Ladner, B. C. The R. E. Hazard Contracting Co. was low bidder on 112 tons of 4 to 8-in. Class B pipe for Estelle Street, San Diego. No action has been taken by Burbank, Cal., on its inquiry for 261 tons of 6 and 8-in. Class B pipe, bids on which were opened Oct. 15. The University of California, Berkeley, has taken bids on 287 tons of 4 to 10-in. Class 150 pipe for delivery at Redwood City, Cal. Santa Ana, Cal., will open bids on Nov. 5 for 449 tons of 2 to 8-in. Class B pipe for the improvement of Dana Point.

Steel Pipe.—Movement of standard steel pipe is restricted, and stocks in distributers' hands are well rounded out. Los Angeles opened bids this week on 243 tons of 1 to 8-in. black and galvanized steel pipe. Pipe line inquiries have been few and far between of late.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.40c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Boston

Pig Iron Buying Light—Scrap Business Marking Time—Structural Steel Awards of 5000 Tons

BOSTON, Oct. 29.—A Rhode Island foundry divided an order for 1000 tons of malleable pig iron for December and first quarter delivery with two Eastern furnaces at prices equivalent to about $17.50 a ton, Buffalo. Otherwise, sales of foundry iron were largely in car lots, and indications are that business during the remainder of 1929 will be comparatively light, owing to recent large buying of Southern iron for last quarter delivery. Buffalo district furnaces have obtained a further concession in the rail and water freight to $4.05 a ton. Eastern iron, however, is offered at sufficiently low prices to meet the new rail and water rate that obtains only to the close of navigation, which probably will be around Nov. 15. While Alabama furnaces are holding to $14.50 a ton, base furnace, for business in their immediate territory, as low as $14 is being done in outside territories.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.55 to $22.05
†Buffalo, sil. 2.25 to 2.75	22.05 to 22.55
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.05 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Cast Iron Pipe.—Few municipalities are openly placing pipe orders, but quite a number of them are privately buying for late 1929 and early 1930 delivery. Tonnages involved in all instances, however, are small. Swampscott, Mass., placed 100 tons of 6 and 8-in. pipe with the United States Pipe & Foundry Co., and Ayer, Mass., bought 150 tons of 8 in. from the Warren Foundry & Pipe Co. Several New England utility companies are sounding out the market on large tonnages for spring delivery. Prices quoted openly on domestic pipe are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.60. A $4 differential is asked on Class A and gas pipe.

Warehouse Prices, f.o.b. Boston

Lag screws	50 and 5
Hot-pressed nuts	50 and 5
Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Warehouse Business. — Wire nails nave been reduced another 10c. per keg, making a total cut during October of 20c., and the price from stock today is $3.20, base. Staples also have been reduced 10c. to $6.05 a keg from stock. Aggregate weekly warehouse shipments are moderately large, but individual orders are small. Owing to continued competition from foreign material, list prices are not rigidly maintained.

Reinforcing Bars. — Business in billet steel bars is by no means brisk, but it is more active than recently. The largest award of the week was 300 tons for a local hotel to the Northern Steel Co., and the next largest was 200 tons for tunnel work in Cambridge, Mass., to the Concrete Steel Co. The Barker Steel Co. took 100 tons for the Warren Foundry & Pipe Co. foundry at Everett, Mass. Prices quoted openly are 2.61½c. a lb., base, from stock on large tonnages and 3.16c. for small lots, but large-lot prices have had to be shaded before buyers would place orders. The rail steel bar market is quiet at 2.26½c. a lb., base, delivered common Boston freight rate points.

Structural Steel.—Fabricated structural steel lettings the past week approximated 5000 tons, 1300 tons of which is for a 1000-ft. radio tower at South Dartmouth, Mass., and 1050 tons is for a Boston bridge. The 5000 tons does not include numerous jobs amounting to less than 100 tons each.

Coke.—Effective Nov. 1, New England by-product foundry coke ovens will accept contracts for first half 1930 delivery on a sliding price scale basis, the price to be determined the first of each month. The prevailing price, $11 a ton, delivered within a $3.10 freight rate zone, will obtain in November. Foundry coke shipments are slightly in excess of those for September, but about 20 per cent less than those for October, 1928. August was the peak month in shipments so far this year.

Old Material.—Scrap prices appear steadier, although there is scarcely enough business to test prices. Dealers' stocks are small, and manufacturing plants are disinclined to sell scrap at prevailing prices. A Worcester, Mass., mill is buying some long bundled skeleton on a basis of $9 to $9.50 a ton, on cars shipping point, and No. 1 heavy melting steel on a basis of $13.25 a ton, delivered. Comparatively little material is moving into the Pittsburgh territory. The Boston Elevated Railway closes bids Oct. 31 on miscellaneous material, the largest item being 500 tons of girder rails, and the Boston & Albany Railroad will sell a small list of miscellaneous material on Nov. 1. An Italian steamer cleared here the past week with 6500 tons of light rails, of which 1500 tons was loaded here and 5000 tons at a Southern port. The rails will be cut into short lengths and will be used as boundary markers in Egypt.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$10.75 to $11.25
Scrap T rails	10.50 to 10.75
Scrap girder rails	9.50 to 10.00
No 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	9.00 to 9.50
Forge flashings	9.50 to 10.00
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.50 to 9.00
Shafting	14.00 to 14.25
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.50 to 9.75

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

St. Louis

Pig Iron Sales for First Quarter Total 2000 Tons—Further Declines in Scrap Prices

ST. LOUIS, Oct. 29.—An improvement in buying of pig iron was noted during the last week, although the market is still quiet as a result of the heavy purchases made by melters more than a month ago. Melters' requirements for the remainder of the year seem to be well taken care of. Of the week's sales of 4500 tons by the St. Louis Gas & Coke Corporation, two lots of 1000 tons each were for first quarter shipment, one lot being for a local jobbing foundry and the other for an Iowa melter. Sales also included 2000 tons of basic to a local company for prompt shipment, 200 tons of foundry iron to an Iowa implement manufacturer and 100 tons each to a local stove manufacturer, a car builder and a jobbing foundry. Business is good with the foundries, except those catering to the automotive industry. The pig iron market is firm, with improvement in the Southern situation noticeable.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—Although new business in plates, shapes and bars for mill shipment is dull, warehouse buying is better, and October will show an increase over the preceding month. Other warehouse lines also are said to be fairly good. Structural fabricators and rolling mills specializing in reinforcing bars are complaining of poor business. No sizable contracts have been placed in some time and only one project is being figured on.

Coke.—The movement of domestic coke continues heavy, and piles at by-product ovens in the district are being reduced considerably. There is a good demand for foundry grades, and smelters continue to take full schedules of furnace coke.

Old Material.—Consumers in the St. Louis industrial district are buying very little old material. One large mill gives as a reason that prices are too high, while others state that their order files do not justify additional purchases at this time. The movement of old material from the country dealers is small because of the low prices. Miscellaneous standard-section rails and bundled sheets are off 25c. a ton, while steel car axles and railroad malleable are 50c. a ton lower. Railroad lists: Union Pacific, 2250 tons; Big Four Lines, 950 tons; Chicago, Milwaukee, St. Paul & Pacific, 360 tons and 120 carloads; St. Louis-San Francisco, 40 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.50 to $14.00
No. 2 heavy melting or shoveling steel	13.00 to 13.50
No. 1 locomotive tires	15.50 to 16.00
Misc. stand.-sec. rails including frogs, switches and guards, cut apart	15.00 to 15.50
Railroad springs	16.75 to 17.25
Bundled sheets	10.00 to 10.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	15.75 to 16.25
Machine shop turnings	7.50 to 8.00
Heavy turnings	9.50 to 10.00
Steel car axles	19.00 to 19.50
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	14.50 to 15.00
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	15.00 to 15.50
No. 1 railroad cast	14.50 to 15.00
Stove plate	12.25 to 12.50
Agricult. malleable	15.25 to 15.75
Relay. rails 60 lb. and under	20.50 to 23.50
Relay rails 70 lb. and over	26.50 to 29.00

Cincinnati

Pig Iron Buying Cautious as Melt Declines, But Prices Are Steady—Cast Grades of Scrap Weaker

CINCINNATI, Oct. 29.—With district consumers of pig iron apparently either well supplied with material for the fourth quarter or withholding purchases until the demand for finished products increases, sales of pig iron in this district declined noticeably last week. The largest order reported among the 2500 tons of iron sold was from a Dayton, Ohio, consumer for 200 tons of Northern foundry for fourth quarter. The remainder of the business was in carload and 100-ton lots. Although pig iron is being sold daily, there are no large tonnages. District sellers report that the melt, particularly in the automobile foundries, is easing off. Prices on both Northern and Southern iron are steady, with Southern still quoted at about $14 to $14.50, base Birmingham.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Materials.—The anticipated increase in production schedules of district sheet mills was realized last week. Although specifications from the automotive field are still below normal, the general sheet demand is being sustained at a good rate. Accordingly, fresh bookings last week were about equal to capacity. With the backlogs of district mills substantially reduced and the delivery situation easier than it has been for months, district consumers are not overspecifying as they did during the summer. While the sheet demand is again reaching normal proportions, interest in cold and hot-rolled strip is still sharply reduced.

Coke.—The total amount of by-product foundry coke moved on contract during October was noticeably less than the total during September. District oven representatives say that a slackening of the automotive demand has caused foundries to specify more cautiously. Specifications last week were a trifle less than the week before and no new business of any size was reported. Prices for the next month on by-product foundry coke will continue at about $10.05, delivered in Cincinnati.

Old Material.—While some mills are still taking scrap on contract at a fair rate, others, particularly in the Valley, are reducing specifications, and in several instances dealers have received cancellations. The market is weaker this week than last. This is shown by the reduction of prices 25c. on 10 items, for the most part in the cast iron grades. The steel grades, however, are still selling at unchanged prices, because the supply is still none too large.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.00 to $13.50
Scrap rails for melting	14.00 to 14.50
Loose sheet clippings	8.50 to 9.00
Bundled sheets	10.75 to 11.25
Cast iron borings	8.75 to 9.25
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.25 to 14.75
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.00 to 13.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.50 to 13.00
No. 1 machinery cast	18.75 to 19.25
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

Seamless steel boiler tubes, 2-in.	17.50
4-in.	36.00

Birmingham

Advance on Alabama Iron for First Quarter Talked of—Good Business in Finished Steel

BIRMINGHAM, Oct. 29.—The pig iron market was quieter during the past week than for some time. Sales are for small fill-in tonnages confined to the local trade. There have been no local inquiries for first quarter iron. Inquiries from outside districts continue to filter in, but producers are not quoting on first quarter business. Talk of an advance in prices is frequently heard, and it is generally predicted that quotations will be 50c. or $1 a ton higher when books are opened for the next period. The base price is now $14.50. There has been a further reduction of stocks this month, though the volume of shipments has fallen a little short of that of September. Current shipments still exceed the make. Fifteen furnaces are active, the same as in the past two weeks. Of this number, seven are on foundry, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—The past week was the best of the month in new business. This business is coming from the regular trade and is shared in by bars, plates, structural shapes, sheets and railroad accessories. Operations are now above 80 per cent of ingot capacity and are considerably higher than one year ago. The market has a firm tone, with prices unchanged. The fabricated structural steel market is regaining some of its former strength. The Gulf States Steel Co. has placed an order with the Ingalls Iron Works Co. for 1000 tons for its new plate mill at Alabama City and expects to place a larger order shortly for its new sheet mill. The Tennessee company is working all eight open-hearths at Fairfield, an increase of one over last week. Eight of nine are active at Ensley. The Gulf States Steel Co. continues to work all six at Alabama City.

Cast Iron Pipe.—An improvement in inquiries and small spot orders during the last three or four days has produced a little better feeling in the market. Sales for the two weeks preceding had been considered the lightest for any comparable period this year. Shipments continue to approximate the make, and backlogs are slender. Dallas, Tex., opened bids Oct. 28 on 4000 tons of pipe. Kansas City, Mo., opens bids today on 2000 tons of large diameter pipe. If the decision pending at St. Petersburg, Fla., is decided in favor of cast iron pipe, about 1000 tons will be required. Bids to be opened by Murfreesboro, Tenn., on Nov. 5 call for one mile of 12-in. and two miles of 8-in. pipe. Greenville, Ala., is taking bids until Nov. 1 for 6000 ft. of 6-in. pipe. Base prices remain at $37 to $38.

Coke.—Industrial coke is quiet in new business. The movement on contracts is considered fair. Prices remain at $5 a net ton, Birmingham.

Old Material.—Demand for important steel grades is holding up well, though mills are placing spot orders and keeping stocks low. Consumer interest is still lacking in iron scrap. Quotations are unchanged. In the iron grades they are nominal.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem	13.50 to 14.00

Buffalo

With Fourth Quarter Needs Well Covered, Pig Iron Buying Declines—No Recovery in Steel Operations

BUFFALO, Oct. 29.—Fourth quarter requirements for pig iron have been well covered, and inquiries have dropped off. A New Jersey foundry which sought 3000 tons of foundry is understood to be still in the market. It is also said that an agricultural implement maker is in the market for 1000 tons of foundry and malleable. Other inquiries are of a minor character. Furnace men report that the melt throughout the district is good and that shipments are steady. A survey shows that the locomotive plants are busy and that the heater industry is fairly active.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Old Material.—Aside from the purchase by the largest consumer of upward of 5000 tons of No. 1 heavy melting steel at $15, the most important event of the past week was the suspension of shipments by another steel company. This mill will not receive any scrap until Nov. 4, and after that time will place its receipts on a quota basis. Almost all of the commodities in the list show a sentimental weakening and the entire market is softer. Steel castings plants appear to be busy.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.00 to $16.00
No. 2 heavy melting steel	13.50 to 14.50
Scrap rails	15.00 to 15.50
Hydraul. comp. sheets	13.50 to 14.50
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	13.75 to 14.00
No. 1 busheling	13.50 to 14.50
Hvy. steel axle turnings	13.50 to 14.00
Machine shop turnings	7.50 to 8.00
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50
Coil and leaf springs	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	11.25 to 11.75
Blast Furnace Grades:	
Short mixed borings and turnings	11.25 to 11.75
Cast iron borings	11.25 to 11.75
No. 2 busheling	9.50 to 10.00
Rolling Mill Grades:	
Steel car axles	17.00 to 17.50
Iron axles	20.00 to 21.00
Cupola Grades:	
No. 1 machinery cast	15.00 to 15.50
Stove plate	12.50 to 12.75
Locomotive grate bars	11.00 to 11.50
Steel rails, 3 ft. and under	18.75 to 19.00
Cast iron carwheels	13.00 to 13.50
Malleable Grades:	
Industrial	17.50 to 18.00
Railroad	17.50 to 18.00
Agricultural	17.50 to 18.00
Special Grades:	
Chemical borings	12.50 to 13.50

Finished Iron and Steel.—Operations of Buffalo mills have not receded during the past week, neither have they increased. Activity in the fabricated structural field has declined to the point where no sizable tonnages have been placed or are in immediate prospect. A contract was awarded for 103 tons of rail steel bars for the new City Hall. There will be about 1000 tons of reinforcing bars in the City Hall, but this contract will be let piecemeal. Reinforcing bar makers report a considerable volume of small lots placed.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Canada

Pig Iron Demand Is Holding at High Level

TORONTO, ONT., Oct. 29.—As a result of the continued heavy pig iron melt by foundries and other consumers in Ontario and Quebec, the demand for merchant iron is holding at a good level, with shipments near the high point for the year. Future buying continues to dwindle, but the spot demand is showing improvement. Hand-to-mouth buyers are showing rather keen interest in the market, and, due to the fact that they are carrying only small tonnages in stock, are forced into the market at regular intervals. Prices are unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—A decline in demand has set in, with only small tonnage orders reported for the week. Some substantial tonnages, however, are pending and will swell sales later in the year. Fabricators state that unfilled orders will maintain capacity operations for about a year.

Old Material.—A stronger market has developed in iron and steel scrap during the past week or 10 days. Consumers are buying more extensively for immediate needs, and there is also a better flow of forward delivery business. Mill requirements are comparatively small at the present time, but these consumers are taking scheduled delivery against contracts and also placing spot orders for special grades. In the Montreal district the domestic demand has strengthened and shipments to United States points are holding at a satisfactory level. Purchases are being made at unchanged prices.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel borings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	15.00	20.00
Axles wrought iron	17.00	22.00
No. 1 machinery cast	....	17.00
Stove plate	....	13.00
Standard carwheels	....	16.00
Malleable	....	13.00
	Per Net Ton	
No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

Youngstown

Valley Mills at Low Point of the Year

YOUNGSTOWN, Oct. 29.—Executives of leading steel companies advise that new business is showing improvement, especially from the automobile industry and they expect this betterment to be manifested in broader production schedules in November. Both the volume of inquiries is stronger and the tonnage involved is larger.

In the meantime, however, production has declined in the Mahoning Valley to the lowest point of the year, averaging about 65 per cent. Of 51 independent open-hearth furnaces, only 30 are active, while 80 of 120 Valley sheet mills are operating. Pipe departments present the strongest schedulings, with 15 of 21 mills running, but tube backlogs are being depleted. Tin mill schedules are also reduced, but it is expected 1930 buying will develop in November, and will serve to stimulate this market.

Some departments at the Ohio works of the Carnegie Steel Co. are completely idle. In this complement, four of six blast furnaces are active.

The Republic Iron & Steel Co. is operating its small-diameter tube mill, producing pipe up to 7 in. by the electric welding process, regularly on commercial production. The company has secured a number of orders for feeder lines to larger pipe line projects. At its Warren works, Republic has completed the conversion of sheet mills to tin mills, and has started construction of its new mechanical tubing plant.

Bantam Ball Bearing Co., South Bend, Ind., has completed a brass foundry in which castings required in the manufacture of ball and roller bearings are made. C. O. Hiler is in charge.

Corporation Declares Extra Dividend

Strong Third Quarter Earnings Statements of United States, Bethlehem and Other Companies

AN extra dividend of $1 a share on the common stock, payable with its regular quarterly dividend of 1¾ per cent, was declared by the directors of the United States Steel Corporation at its meeting in New York, Oct. 29. Earnings for the first nine months of 1929 were equivalent to 15.82 per cent on the common shares outstanding as compared with 8.17 per cent for the same period of 1928. In the light of these earnings the directors voted the extra dividend.

Total earnings for the third quarter were roughly $70,174,000, or close to the nearly $72,000,000 of the second quarter. The principal figures of the earnings statement are given in the accompanying table.

The quarter's net earnings available for common dividends amounted to $45,270,431, or nearly $5.87 per share of the 8,131,071 shares outstanding on Oct. 29. The earnings per share on 8,030,304 shares in the second quarter amounted to $5.92. To express further the comparisons between this year and last, it may be mentioned that total earnings for nine months were $202,274,555 in 1929 and $140,015,494 in 1928.

Action on the proposed purchase of the properties of the Columbia Steel Corporation was postponed, and the option expiring Oct. 29 was extended to Oct. 31.

Bethlehem's Third Close to Second Quarter

The Bethlehem Steel Corporation reported net income for the third quarter of $11,384,720, or nearly three times the net income for the corresponding quarter last year and only 3.2 per cent less than the total of $11,766,473 for the second quarter of 1929.

Earnings for the third quarter, after deducting all charges and dividends on the preferred stock, were equivalent to $4.01 a share on the 2,400,000 shares of common outstanding during the period, compared with $4.17 a share for the second quarter.

In presenting the report Eugene G. Grace, president, declared that business conditions are sound and that current pessimism in the stock market is unwarranted. Billing prices for the company were 10c. a ton lower in the third quarter than in the previous quarter, but $1.56 a ton higher than in the third quarter of last year. Orders on hand, however, showed improvement, amounting to $61,070,000 at the end of the third quarter, compared with $56,830,000 at the end of the preceding period, a gain of 7.5 per cent.

Operations in the third quarter averaged 97.8 per cent of rated capacity, compared with 100.6 per cent in the quarter ended on June 30 and 82.3 per cent in the third quarter of 1928. At present, he said, production is at 82 per cent of capacity.

The company's railroad car bookings are the best in eight years, and the Bethlehem shipyards will enter 1930 with the best schedule in years.

Bethlehem's Expansion Program

President Grace announced an expansion program that will increase the company's ingot capacity 1,250,000 tons annually and its by-product coke oven capacity 1,000,000 tons. Improvements will be mainly at the Sparrows Point and Lackawanna plants. Additions will be made to plate, sheet and roughing mills at the former plant and to the roughing and billet mills at Lackawanna. An important part of the improvements to be undertaken will be a system of cleaning and distributing by-product coke and blast furnace gas at various plants, thereby reducing the company's coal consumption. The expansion program will cost $50,000,000.

Directors declared the usual quarterly dividend of $1.50 a share on the common stock and $1.75 a share on the preferred stock.

Republic and Gulf States Report Earnings

The Republic Iron & Steel Co. reports net profits, after all deductions, of $2,527,094 for the third quarter, as compared with $3,263,309 for the June quarter and $2,877,127 for the March quarter and $1,280,775 in the September quarter of 1928. The total profit for nine months is $8,667,530.

The Gulf States Steel Co. had net profit of $326,975 in the third quarter, compared with $405,630 in the preceding quarter and $139,850 in the September quarter of 1928. Net profit for nine months of this year is $1,086,860.

The Virginia Iron, Coal & Coke Co. reports a net loss for the third quarter of $11,929. Net loss for nine months is $39,893.

Earnings of United States Steel Corporation

Earnings for Third Quarter, 1929

	Total Earnings	
July, 1929	$24,303,058	
Aug., 1929	24,687,089	
Sept., 1929	21,183,566

Recasts Steel Founders' Organization

CHICAGO, Oct. 29.—Large attendance and a high degree of enthusiasm marked the meeting held today by the Steel Founders' Society of America at the Hotel Sherman, Chicago. Granville P. Rogers, Graybar Building, New York, managing director of the society, read a survey-report of the industry. This report was unanimously adopted. New by-laws, designed to permit the right mechanical structure for carrying on the work of the society and to add flexibility to membership participation in affairs of the society, were read and adopted.

New officers elected are: President, J. E. McCauley, Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa.; vice-president, Eastern Division, W. H. Worrilow, Lebanon Steel Foundry, Lebanon, Pa.; vice-president, Central Atlantic Division, John E. Galvin, Ohio Steel Foundry, Lima, Ohio; vice-president, Midwest Southern Division, Arthur Simonson, Falk Corporation, Milwaukee; vice-president, Mid-Continental Division, E. H. Cornelius, Oklahoma Steel Castings Co., Tulsa, Okla.

New directors are: Eastern Division, R. J. Doty, Reading Steel Casting Co., Reading, Pa.; W. M. Faison, Atlantic Steel Castings Co., Chester, Pa.; G. R. Casey, Treadwell Engineering Co., Easton, Pa. Central Altantic Division, H. J. Koch, Fort Pitt Steel Casting Co., Pittsburgh; Clarence W. Howatt, Pittsburgh Steel Foundry Co., William Powell, Mesta Machine Co., Pittsburgh. Midwest Southern Division, S. W. Utley, Detroit Steel Casting Co.; J. T. Oster, Hubbard Steel Foundry Co., East Chicago, Ind., and L. S. Peregoy, Sivyer Steel Casting Co., Milwaukee.

Two Large Ships to Be Built at Fore River

WASHINGTON, Oct. 29.—Two combination passenger-cargo vessels of 11,300 deadweight tonnage will be built in the Fore River, Mass., yard of the Bethlehem Shipbuilding Corporation for the Oceanic Steamship Co. They will be among the largest ships ever to be built in an American yard and will have a 20-knot speed and will be superior in type to others engaged in the San Francisco - Australian trade for which they have been designed. Contracts covering loans of $11,700,000 to apply on the cost of construction of the two vessels have been signed by Chairman T. V. O'Connor of the Shipping Board, W. P. Roth of the Oceanic company and E. P. Hill of the Bethlehem corporation.

Non-Ferrous Metal Markets

All Markets Inactive—Lead and Zinc Lower—Copper Unchanged—Tin Erratic

NEW YORK, Oct. 29.

DRASTIC declines in the New York stock market have had their effect abroad so as to cause declines in some metals in the London and other markets. Not only has this retarded buying in this country, but it has held up purchases from abroad. Lead and zinc have both declined in the last week or so and tin fell precipitately a little earlier. Copper is the metal that has been least affected.

Copper.—Buying of copper is almost at a standstill except possibly from abroad, and this has been decidedly retarded in the last few days. While sellers here do not expect a decline in the price, consumers are aware of the fact that it will not advance and they are also uncertain as to the effect of the stock market on future business. Domestic buying is only of the hand-to-mouth variety. November requirements are not yet covered and very little has been bought for December. Consumers abroad have still considerable to buy for early consumption, but are in no hurry to cover. Copper is the only metal that has not declined during the stock market upheaval. Electrolytic copper is quoted at 18c., delivered in the Connecticut Valley, and the price of Copper Exporters, Inc., is still 18.30c., c.i.f. European ports. Lake copper is unchanged at 18c. to 18.12½c., delivered.

Tin.—Sales of spot Straits tin were not over 400 tons for the week ended Oct. 26, the inactivity being traced largely to the stock market. Strange to say, tin has remained fairly steady in the past week, it having had its first precipitate decline about two weeks ago, with another a week ago. There is, however, no confidence, and consumers are buying only a little as they need it, mostly spot metal. Dealers are doing nothing. October shipments from the Straits are again revised lower, the estimated total being now put at 8500 tons, as against about 10,000 tons early in the month. Prices in London today were about £2 a ton higher than a week ago, with spot standard quoted at £184 5s., future standard at £188 5s. and spot Straits at £188 10s. The Singapore market today was £189 2s. 6d. In the New York market today, spot Straits tin was quoted at 40.75c., which is only a little higher than the low point of 40.25c. on Oct. 21, the lowest level

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Oct. 29	Oct. 28	Oct. 26	Oct. 25	Oct. 24	Oct. 23

Cast aluminum	11.75c.	13.75c.

since Aug. 21, 1923. The market today was exceedingly inactive.

Lead.—Today the American Smelting & Refining Co. reduced its contract price from 6.90c. to 6.75c., New York. As a result, leading producers in the West reduced their price to 6.55c., St. Louis. As in the case of other metals, buying has been very light and largely hand-to-mouth.

Zinc.—Due to lower prices at London, quotations for prime Western zinc fell again yesterday from 6.70c. to 6.60c., East St. Louis, under much the same conditions as a week ago. Of course, the decline this week and last has not stimulated buying, which continues spasmodic. The price for ore continues unchanged at $44, Joplin, and sales were light at 8970 tons for the week ended Saturday, Oct. 26. Production was fairly large at 13,600 tons for the week, leaving the surplus still high at 43,620 tons.

Antimony.—Consumers and dealers have been active, and the price of Chinese metal is unchanged at 8.75c., New York, for all positions. Cables to importers here indicate that the revolutionary disturbances in China are affecting freight rates, and higher prices are probable.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. per lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Oct. 29.—Prices for tin are quoted up ¼c. at the end of a week in which fluctuations were frequent. Sales of non-ferrous metals are in small volume. The old metal market is quiet and prices are nominal.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 41.50c.; lead, 6.80c.; zinc, 6.80c.; in less-than-carload lots, antimony, 9.75c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Gulf States Steel Co. and the Central Iron & Steel Co. have appointed the new firm of Pittman & Squires, Los Angeles and San Francisco, their California representatives. Frank Pittman and G. F. Squires are both well known on the Pacific Coast, Mr. Pittman having been associated for some years with C. W. Pike & Co. in Los Angeles and Mr. Squires was with the same company in San Francisco up to a few years ago, when he resigned to become sales manager for the Pacific Sheet Steel Co. Offices in Los Angeles have been opened in the Western Mutual Life Building and in San Francisco at 39 Natoma Street.

To Consider Depreciation on Equipment

Uniformity Desired in Computing Income Tax—Standards Being Compiled as a General Guide

WASHINGTON, Oct. 28.—The fourth annual conference of machinery and equipment associations will be held at the Chamber of Commerce of the United States here on Nov. 11. In announcing the conference, Secretary Philipp P. Gott said that among the subjects to be discussed will be those relating to depreciation on machinery and equipment, the Senate Finance Committee amendment in the tariff bill prohibiting American trademarked imports, and discounts on motor equipment.

Concerning depreciation, the announcement stated that the trade associations, at the suggestion of the Treasury Department, undertook the study of rates of depreciation of machinery and equipment and that the department recently stated that it would discontinue such studies and would issue within a few months a publication containing rates of depreciation. Members of the associations, it was suggested, should examine the rates affecting their respective industries. The Bureau of Internal Revenue hopes to have the publication available by Jan. 1, though it may be delayed.

The publication will cover depreciation rates for all industries and will be the first of the kind ever prepared. The field work has been completed and the data compiled, and the material is now being edited. The undertaking required an enormous amount of work and has been made possible only through the cooperation of the industries of the country. The study, in the form in which it will appear, was begun last May. Particular interest has been shown in the matter of depreciation by the machinery and equipment manufacturers and users. The rates to be presented in the bulletin will be used as a guide for industries, but their adoption will be in no way compulsory. The purpose of the Bureau of Internal Revenue is to determine rates of depreciation on as nearly correct a basis as possible and to give uniformity to the rates.

To Discuss Trademarks on Imports

The announcement of the forthcoming meeting of the machinery and equipment associations explained that the House tariff bill continues the provision in the existing Fordney-McCumber tariff act, making it unlawful to import merchandise of foreign manufacture if it bears a trademark owned by a citizen, corporation or association of the United States, unless a written consent of the owner of the trademark is produced at the time of making customs entry. The Senate committee amendment, however, struck out the consent provision so that prohibition of such imports is made unconditional.

Members of the associations have been asked if they have considered the effect on their industries if foreign governments retaliated by enacting similar provisions. They were also asked to give consideration as to the customs of the trade regarding discounts on products sold to those engaged in the manufacture of other products.

Midvale Co. Buys Chrome Alloy Foundry

Purchase of the Chrome Alloy Products, Inc., Conshohocken, Pa., by the Midvale Co., Nicetown, Philadelphia, is announced, marking the definite entry by the Midvale Co. into the field of high-grade chrome and chrome-nickel alloy castings. T. Holland Nelson, developer of the Conshohocken foundry, has been retained as consulting engineer and in an advisory capacity to work out problems of construction of materials resistant to heat and corrosion. This makes it possible for the process industries to have at their command the experience of the personnel of the Midvale Co. in securing special compositions in the most marketable form.

A battery of induction furnaces has recently been installed to furnish castings in any size from the smallest up to the capacity of the furnaces. The Midvale company meanwhile has obtained exclusive rights to manufacture in the United States those patented compositions of chrome and nickel with other alloys held by Commentry-Fourchambault et Decazeville of Paris, France, commonly known as ATV-1, ATV-2, ATV-3, AMF, BTG, etc. It is also licensed under patents to Sir Robert Hadfield to produce steel of the composition of the Era ATV and Era HR grades.

Central Alloy to Install 25-Ton Electric Furnace

Plans for construction of a new 25-ton electric melting furnace by the Central Alloy Steel Corporation, Massillon, Ohio, have been announced by F. J. Griffiths, chairman of the company. The new equipment is required to provide for rapidly expanding demand for Nirosta, the new stainless steel manufactured by the company under Krupp license.

The new furnace will be located at the Canton works and its cost will approximate $200,000. The company also has authorized an expenditure of new circle cutting equipment to provide increased facilities for special steel.

Fabricated Structural Steel

Awards of About 55,500 Tons Largely for Work in New York District—43,000 Tons in Inquiries

FABRICATED structural steel awards, at about 55,500 tons, again hit a good stride, but about two-thirds of the tonnage is for the New York district, making a comparatively small showing for the rest of the country. Likewise, the major part of the 43,000 tons in new projects emanates from the New York district. The largest job awarded was 13,200 tons for New York subway work. A New York office building takes 9300 tons, Long Island Railroad grade elimination work, 6000 tons, and a Brooklyn hospital, 5850 tons. New subway sections call for bids on 12,300 tons, two New York apartment buildings will require upward of 11,000 tons, an apartment building in Chicago, 4000 tons, and a St. Louis building, 4000 tons. Awards follow:

BELLE, W. VA., 100 tons, building for Du Pont Engineering Co., to Virginia Bridge & Iron Works.

PHILADELPHIA, 1560 tons, bridge at Henry Avenue on which Francis A. Canuso is contractor, to Phoenix Bridge Co.

ATLANTA, GA., 880 tons, railroad viaduct, to Virginia Bridge & Iron Co.

ASHLAND, KY., 300 tons, building for American Rolling Mill Co., to unnamed fabricator.

BOSTON, 1050 tons, Congress Street bridge, to McClintic-Marshall Co.

SOUTH DARTMOUTH, MASS., 1300 tons, radio tower, to International Derrick & Equipment Co.

JEWETT CITY, CONN., 468 tons, bridge, to American Bridge Co.

ENWOOD, VT., 280 tons, trash racks and trash rack supporters, Connecticut River Development Co., to two unnamed fabricators.

CONCORD, N. H., 200 tons, hospital unit, to F. P. Lyons & Co.

PROVIDENCE, R. I., 300 tons, hardware warehouse, to James H. Tower Iron Works.

SPRINGFIELD, MASS., 125 tons, Court House, to Harrmann Steel Co.

PITTSFIELD, MASS., 150 tons, school, to unnamed fabricator.

NEW YORK, 1000 tons, public school 105 in Bronx, to Easton Structural Steel Co.

NEW YORK, 13,200 tons, section 5, route 108 of subway in Queens, to McClintic-Marshall Co.

NEW YORK, 9300 tons, Salmon Building at Fifth Avenue and Forty-second Street, to McClintic-Marshall Co.

NEW YORK CENTRAL RAILROAD, 2300 tons, commissary building at 161st Street, New York, to McClintic-Marshall Co.

BROOKLYN, 5850 tons, King's County Hospital, to Harris Structural Steel Co.

LONG ISLAND RAILROAD, 6000 tons, grade crossing elimination, to American Bridge Co.

STATE OF NEW YORK, 450 tons, highway marker supports, to Buffalo Steel Co.

MOHAWK, N. Y., 150 tons, highway bridge, to American Bridge Co.

PASSAIC, N. J., 800 tons, United States Rubber Co. building, to American Bridge Co.

PHILADELPHIA, 450 tons, Stanley Film Exchange Building, to Cantley Co.

PENNSYLVANIA RAILROAD, 500 tons, electric transmission towers for electrification work at Morristown, N. J., to American Bridge Co.

STATE COLLEGE, PA., 480 tons, power house for Pennsylvania State College, to Pittsburgh Bridge & Iron Co.

BIG SANDY & CUMBERLAND RAILROAD, 275 tons, bridge at Devon, W. Va., to Virginia Bridge & Iron Co.

ALABAMA CITY, ALA., 1000 tons, plate mill for Gulf States Steel Co., to Ingalls Iron Works.

SAN ANTONIO, TEX., 300 tons, Curtis Flying Field building, to McClintic-Marshall Co.

MILWAUKEE ROAD, 100 tons, bridge, to an unnamed bidder.

CHICAGO, 950 tons, Wieboldt department store, to American Bridge Co.

CHICAGO, 1400 tons, Ruth garage, to American Bridge Co., previously reported to an unnamed bidder.

ST. LOUIS, 4500 tons, bridge for Missouri Pacific across Merrimac River, to American Bridge Co., previously reported to an unnamed bidder.

OMAHA, NEB., 1500 tons, Union Station, to McClintic-Marshall Co.

OMAHA, 700 tons, train shed, to American Bridge Co.

OMAHA, 300 tons, railroad station concourse, to Baxton Vierling Iron Works, local.

PALO, ALTO, CAL., 156 tons, apartment building on Forest Avenue, to McClintic-Marshall Co.

LOS ANGELES, 1100 tons, Los Angeles Stock Exchange office building, to Consolidated Steel Corporation.

SEATTLE, 100 tons, two buildings for Pacific Telephone & Telegraph Co., to Hofius Steel & Equipment Co. and Wallace Bridge & Structural Steel Co.

OLYMPIA, WASH., 118 tons, bridge over North River, to Poole & McGonigle.

MARSHFIELD, ORE., 400 tons, H. M. Bylesbee Co. power house, to Minneapolis Steel & Machinery Co.

ASHLAND, ORE., 600 tons plates, 24-in. welded steel pipe line, to Beall Pipe & Tank Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 5050 tons, apartment building for San Remo Towers, Inc., Seventy-fourth Street and Central Park West.

NEW YORK, 1100 tons, apartment building for Massasoitt Corporation at 50 East Seventy-ninth Street.

NEW YORK, 12,300 tons, section 10, route 107 of subway in Brooklyn.

NEW YORK, 6000 tons, apartment building and hotel at 981 Madison Avenue.

BROOKLYN, 1200 tons, New York *Times* plant.

STATE OF NEW YORK, 300 tons, highway bridges.

PASSAIC AND BERGEN COUNTIES, N. J., 600 tons, bridge across Passaic River.

STATE OF PENNSYLVANIA, 350 tons, four highway bridges.

AKRON, OHIO, 700 tons, building for Akron *Times*.

INDIANAPOLIS, 6270 tons, White River bridge for Indianapolis Union Railway, new bids to be asked for.

HARRISBURG, PA., 1700 tons, Farm Show building, general contract to Sinclair & Grigg, Philadelphia.

SOUTHERN RAILWAY, 500 tons, bridge over Savannah River near Augusta, Ga.

CHICAGO, 800 tons, apartment building at 1200 Stone Street; Smith & Brown, architects.

CHICAGO, 500 tons, Hugolet apartments; Schmidt, Gardner & Erickson, architects.

CHICAGO, 4000 tons, George W. Griffiths apartment building; Holabird & Roche, architects.

CHICAGO, 2100 tons, Lawson Memorial Y. M. C. A. building.

WAUKEGAN, ILL., 500 tons, building for Johns-Manville Corporation.

STATE OF MINNESOTA, 600 tons, highway bridges.

ST. LOUIS, 4000 tons, Wenzlick Tower building.

TACOMA, WASH., 2400 tons, Eleventh Street viaduct; bids opened.

SEATTLE, 1000 tons, Fourteenth Avenue South bridge; Puget Sound Bridge & Dredging Co., low bidder.

SEATTLE, 243 tons, approach to West Spokane Street bridge; general contract to General Construction Co.

MONTEREY, CAL., 109 tons, bridges; bids opened.

Railroad Equipment

Rock Island In the Market for 5000 Cars

THE Chicago, Rock Island & Pacific has inquired for 5000 freight cars, the Pacific Fruit Express has ordered 400 refrigerator cars and the Pennsylvania has ordered 100 locomotives. The Chesapeake & Ohio will buy 100 to 130 locomotives. Details of the week's business follow:

Pacific Fruit Express has ordered 400 refrigerator cars from Pacific Car & Foundry Co.

Pennsylvania has ordered 100 locomotives, of which 50 will be built by Baldwin Locomotive Works, 25 by Lima Locomotive Works and 25 in railroad's own shops at Altoona, Pa. Company's shops will build 100 tenders also.

Rock Island will buy 1000 gondola, 1500 automobile, 2000 box, 250 stock and 250 flat cars.

Wabash will buy three baggage and mail cars.

Chesapeake & Ohio will buy 100 to 130 locomotives; one-half will be eight-wheel switching locomotives and the remainder 2-10-4 type.

Ford Motor Co. has ordered one 600-hp. and one 300-hp. oil-electric locomotive from Ingersoll-Rand Co. for its River Rouge plant. These locomotives will be furnished with General Electric equipment and will be built at the Erie works.

Five million cubic yards of earth are being carried on belt conveyors from Denny Hill to Elliott Bay in Seattle, Wash., in the regrading of Denny Hill. The earth is transported for over half a mile on conveyors which run overhead, clearing street car trolley wires and avoiding interference with general business and traffic. Belts are 36 in. wide, operate at a speed of 500 ft. a min. and have a capacity of 600 cu. yd. an hour. The various conveyor sections are 1360 ft., 920 ft. and 600 ft. long. The conveying system was furnished by the Link-Belt Co., Chicago.

PERSONAL

Weirton Steel Co. Changes; J. C. Williams President

As a result of the combination of the Weirton Steel Co., Weirton, W. Va., the Great Lakes Steel Corporation, Detroit, and the iron ore, blast furnace and steamship interests of the M. A. Hanna Co., Cleveland, the following changes have been made in the executive personnel of the Weirton company, and were announced by E. T. Weir, who will be chairman and chief executive of the new National Steel Corporation which results from the merger.

Mr. Weir becomes chairman of the board of directors of the Weirton company, and has been succeeded as president by J. C. Williams, heretofore first vice-president. In addition to H. D. Westfall, two new vice-presidents were elected: F. A. Hanlin, who has been secretary, and W. F. Morris, Jr., who has been general traffic manager. C. H. Hunt, chief engineer, was elected assistant to the president, and W. A. Murphy, who has been purchasing agent, was made secretary, succeeding Mr. Hanlin.

J. C. Williams was born at Kidwelly, Wales, March 31, 1876, and attended school in that country. His early experience in the steel business was obtained in Welsh mills and also in Italy. He came to the United States in 1897 and became superintendent of the Champion Iron & Steel Co., Muskegon, Mich. In 1903 and 1904 he was assistant superintendent at the National works, Monessen, Pa. In 1905, with E. T. Weir and others, he helped to organize the Phillips Sheet & Tin Plate Co., which purchased the Jackson Iron & Steel Works, Clarksburg, W. Va. He has been associated with Mr. Weir since that time. He is also president and a director of the Weirton Improvement Co. and a director of the Bank of Weirton, and is prominently identified with financial that time has occupied positions in various departments of the Weirton Steel Co., which succeeded the Phillips organization. He is vice-president and a director of the Weirton Improvement Co., secretary and a director of the Weirton Coal Co., vice-president and a director of the Oak Hill Supply Co., and a director of the Bates Iron Co., besides holding directorships in various civic and financial organizations in Weirton and and civic organizations in Weirton and Steubenville, Ohio.

Mr. Hanlin was born in Midway, Washington County, Pa., Aug. 12, 1888, and attended schools of the North Side, Pittsburgh. His early business experience was obtained with Charles E. Pope and the Pope Tin Plate Co., with whom he became connected in 1904. When the Pope company was purchased by the Phillips Sheet & Tin Plate Co. in 1912, Mr. Hanlin went to Weirton and since Steubenville.

Mr. Morris was born at Mahoning, Pa., Aug. 23, 1877, and attended school in Pittsburgh. His early business experience was gained with the Pennsylvania Railroad, the Great Northern Railway, and the Crucible Steel Co. of America. He became associated with the Weirton company as traffic manager in 1920, and has made his headquarters in the Pittsburgh office.

Clinton H. Hunt was born at Cleveland, Dec. 14, 1883, and attended school at Ravenna, Ohio. He gained his early steel mill experience with the William Tod Co., Pittsburgh, the Morgan Engineering Co., Alliance, Ohio, the Carnegie Steel Co. and the Youngstown Sheet & Tube Co. He went with the Weirton company as chief engineer in 1915, and has held that position continuously since.

Wilmer A. Murphy was born at Barnesville, Ohio, Feb. 22, 1899, and attended school in that city. He was employed for a time by the La Belle Iron Works, Steubenville, Ohio, now a part of the Wheeling Steel Corporation, and went with the Weirton company in 1922 as assistant purchasing agent.

—

J. K. MERWIN, formerly of the Cleveland office of the Chain Belt Co., Milwaukee, has been placed in charge of the newly-opened Boston office of the company.

—

P. J. HALE has been appointed resident engineer for Freyn Engineering Co., Chicago, in connection with the blast furnace to be built near London for the Ford Motor Co. He sailed on Oct. 25 for England.

—

E. G. JONES, formerly of the Canadian Brake Shoe Co., Ltd., has become superintendent of the plant of the Joliette Steel, Ltd., Joliette, Que. J. CRITCHLEY has been appointed sales engineer.

—

HERBERT E. FENNER, general service manager of the American Bosch Magneto Corporation, Springfield, Mass., sailed from New York on an extended tour of the principal cities of South America.

—

C. R. BURT, vice-president and general manager of Pratt & Whitney Co., Hartford, Conn., will address a joint meeting of the Providence section of the American Society of Mechanical Engineers and the management section of the Providence Engineering Society, Nov. 5, at the rooms of the latter society, on "Modernizing an Old New England Industry."

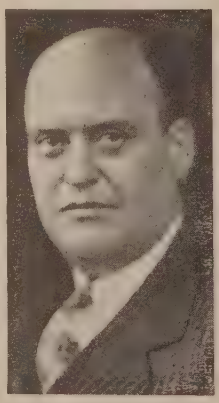
—

GEORGE R. ROBERTS has been placed in charge of the newly-established Los Angeles office of Alexander Milburn Co., manufacturer of welding and cutting apparatus, Baltimore.

—

HENRY J. FREYN, president, Freyn Engineering Co., Chicago, returned Oct. 26 on the Aquitania from a two months' business trip in Russia, England, Germany and France.

J. C. Williams, new president, Weirton Steel Co.



F. A. Hanlin, former secretary, now vice-president, Weirton Steel Co.

J. F. Morris, former general traffic manager, now a Weirton vice-president

C. H. Hunt, former chief engineer, named assistant to president of Weirton

R. J. WYSOR

R. J. WYSOR, since January, 1928, general manager of the Jones & Laughlin Steel Corporation, Pittsburgh, has resigned and, with his former chief, T. M. GIRDLER, recently president of the Jones & Laughlin company, will become associated with the Otis & Co.-Eaton-Mather group in Cleveland. Mr. Wysor was born in Dublin, Va., and attended the Virginia Polytechnic Institute, Blacksburg, Va., from which he was graduated in 1906. For the next four years he was chemist and assistant chief chemist at the Duquesne works, Carnegie Steel Co. In 1910 he became metallurgist for the Panama Canal Commission, and in 1912 went with the Bethlehem Steel Co., serving as chief chemist and engineer of tests from 1912 to 1916, superintendent of blast furnaces from 1916 to 1918, superintendent of the service division, Bethlehem plant, from 1918 to 1919, assistant general manager, Sparrows Point, Md., plant, from 1919 to 1923, and assistant general manager, Cambria plant, Johnstown, Pa., from 1923 to 1925. He went to the Jones & Laughlin company in 1925 as assistant general manager.

—

KURTH J. PAPKE, sales manager of Durant Mfg. Co., Milwaukee, has resigned to organize K. J. Papke Co., 290 Third Street, Milwaukee, manufacturers' representative, which will handle Durant line of counting and measuring machines in Wisconsin and also represent Precision Thermometer & Instrument Co., Philadelphia; Divine Brothers Co., Utica, N. Y., casters and truck wheels; Universal Engineering Co., Frankenmuth, Mich., drill bushings; Welded Products Mfg. Co., Cudahy, Wis., factory stools, platforms, trucks, and the Wright Machine Co., Worcester, Mass., screw machine products and metal specialties.

—

ARTHUR KANE, formerly with Giddings & Lewis Machine Tool Co., Fond du Lac, Wis., has resigned to take charge, as vice-president, of the newly-organized pattern engineering and service division for Middle Western States of John Ehne & Son Co., Milwaukee, manufacturer of metal and wooden patterns, which has recently increased its capitalization. J. ARTHUR EHNE is president and general manager.

—

WILLIAM E. CRAWFORD, electrical engineer with the A. O. Smith Corporation, Milwaukee, since 1920, has been elected president of the Engineers Society of Milwaukee. Secretary E. W. RHODE and treasurer WALTER R. MUELLER were reelected. T. CHALKLEY HATTON, consulting engineer and formerly chief engineer of the Milwaukee Sewerage Commission, was elected vice-president, and BRUNO V. NORDBERG, W. D. BLISS and E. H. MACK, directors.

—

C. F. KELLEY, president, Anaconda Copper Mining Co., has been awarded the gold medal of the Mining and Metallurgical Society of America "for expansion and stabilization of the mining industry."

—

CHARLES LE GEYT FORTESCUE, chief consulting transmission engineer for the Westinghouse Electric & Mfg. Co., East Pittsburgh, was recently given the honorary degree of Doctor of Laws by Queens University, Kingston, Ont.

—

EDWARD B. NEWILL has resigned as manager of the control engineering department of the Westinghouse Electric & Mfg. Co., East Pittsburgh, to become associated in an executive capacity with the radio manufacturing company, which is being formed jointly by the General Motors Corporation and the Radio Corporation of America. Mr. Newill entered upon his new position Oct. 16, with the title of assistant to the president of the Delco Products Co., and will have headquarters temporarily at Dayton, Ohio. When the organization of the new radio company is completed Mr. Newill will be assigned executive duties in connection with either engineering or manufacturing. He was graduated from the Georgia School of Technology, Atlanta, Ga., in 1915, and has been associated with the Westinghouse company since that time.

—

F. E. FIEGER, assistant general manager, Jones & Laughlin Steel Corporation, Pittsburgh, has been appointed general manager, succeeding R. J. WYSOR, who has resigned as noted elsewhere in these columns. Mr. Fieger went with the Jones & Laughlin company in 1917 as superintendent of the wire department, Aliquippa works, and the next year was made superintendent of steel works. He was made assistant superintendent at

F. E. FIEGER

Aliquippa in 1920, general superintendent of that plant in 1923 and assistant general manager of the company in January, 1928. J. Z. COLLIER and J. G. WEST, JR., have been appointed assistant general managers. Mr. Collier was formerly general superintendent, Aliquippa works, and Mr. West, general superintendent, North Side works, Pittsburgh. C. M. WHITE, who has been assistant to Mr. Collier, succeeds him at Aliquippa, and HARRY SAXER, superintendent of blast furnaces and coke works at that plant, becomes assistant general superintendent at the Aliquippa works. S. S. MARSHALL, JR., general superintendent, South Side works, Pittsburgh, has been made general superintendent of all Pittsburgh plants. H. D. STARK continues as assistant general superintendent in charge of South Side works, and J. C. MURRAY, who has been superintendent of the Eliza blast furnaces, becomes assistant general superintendent in charge of North Side works.

Round Table on Test Data Presentation

In any systematic investigation into the properties of materials—or, in fact, in any extended series of experiments—it becomes a problem to appraise properly the mass of numerical data accumulated. Methods of presentation of such test data will be discussed in a round table conference in New York during the first week in December, held by a committee of the American Society for Testing Materials in conjunction with the annual meeting of the American Society of Mechanical Engineers. The discussion will be open to all those interested.

R. E. Hess, 1315 Spruce Street, Philadelphia, is in charge of preliminary arrangements for holding this conference.

OBITUARY

FRANCIS A. J. FITZGERALD, past-president of the American Electrochemical Society, died of pneumonia on Oct. 27 at his home in Niagara Falls, Ont., aged 59 years. He was born in Dublin, Ireland, and came to

F. A. J. FITZGERALD

America in 1893. He was a graduate of Massachusetts Institute of Technology, was one of the founders of the Acheson Graphite Co., and for many years conducted the FitzGerald Laboratories in Niagara Falls.

—

WILLIAM J. STOOP, for 35 years prominently identified with the iron and steel industry in Pittsburgh and nearby districts and most recently general manager of the Morgan Engineering Co., Alliance, Ohio, died on Oct. 3 at his home in Pittsburgh, following a long illness. He began his business career with the Mackintosh-Hemphill Co., Pittsburgh, of which he later became general superintendent. He then went with the Mesta Machine Co. Homestead, Pa., in a similar capacity. He was next associated with the Portsmouth Steel Co., Portsmouth, Ohio, which later became a part of the Whitaker-Glessner Co., and served for several years as general superintendent of that plant. When the company was merged with others to form the Wheeling Steel Corporation, Mr. Stoop went to Wheeling, W. Va., as vice-president and chief of construction. Upon leaving that company about three years ago he was made general manager of the Morgan Engineering Co., having held that position until November, 1928, when he retired on account of ill health.

—

RICHARD H. TYNER, president, National Marking Machine Co., Cincinnati, died suddenly on Oct. 24, aged 61 years. He helped found the company in 1911.

ERNEST F. HARDER, assistant to the vice-president Westinghouse Electric & Mfg. Co., Newark, N. J., works, died at his home in East Orange, N. J., on Oct. 13. He was born in Germany in 1858 and came to the United States 25 years later.

—

EDWARD PAYSON BAIRD, president of the Baird Lock Co., Chicago, died on Oct. 24. He had been engaged in the clock and lock manufacturing business for 50 years. He went to Chicago in 1893 and in 1900 established the Baird Mfg. Co., and in 1915 the Chicago Cabinet Lock Co.

—

GEORGE ROW, managing director and secretary of the Upper Forest & Worcester Steel & Tinplate Works, Ltd., Morriston, Swansea, Wales, died Oct. 25, aged 75 years. He was one of the founders of the Welsh Plate and Sheet Manufacturers Association and had been a member of the Iron and Steel Institute (British) since 1910.

Nine-Month Record in By-Product Coke

WASHINGTON, Oct. 28. — Although the daily output of by-product coke, like that of pig iron, declined somewhat from the unusually high level maintained in August, it fell only slightly short of the high record established earlier in the year, according to the Bureau of Mines. The total output of by-product coke for the 30 days of September amounted to 4,413,011 tons, an average of 147,100 tons a day. In comparison with the daily average of 149,767 in the previous month, this was a decrease of 1.8 per cent. The decrease, however, was confined to the furnace plants, for at the merchant ovens the daily output increased slightly.

There were 86 by-product plants in operation during the month and they produced 92 per cent of their capacity. Beehive coke production for September was estimated at 504,300 tons, a decrease of 10.2 per cent from the preceding month. The combined output of both kinds of coke was 4,917,311 tons.

A new high record was set by both the coke and pig iron industries during the first nine months of this year. The output of by-product coke was 40,363,248 tons and of beehive coke, 4,786,600 tons, a total of 45,149,848 tons; while the production of pig iron was 32,648,371 tons. The nearest approach to the current production was in 1923, when the nine-month output of coke amounted to 44,205,000 tons and that of pig iron to 31,094,873 tons.

Stocks of by-product coke on hand at producers' plants at the end of September amounted to 2,201,508 tons, an increase of 4.8 per cent from Aug. 31. The furnace plants, with 932,264 tons, showed an addition of 46,520 tons. The merchant plants, with 1,269,244 tons, added 54,870 tons during September.

August Immigration Above That in July

WASHINGTON, Oct. 28.—Making an increase of 2710 over July, 22,778 immigrant aliens were admitted to the United States in August, according to the Bureau of Immigration. Females (11,932) outnumbered males (10,846) among the immigrants admitted in August. Europe provided 11,879 of the immigrants, Germany leading with 2301, followed by Italy with 2030. Great Britain was third with 1906, while 1551 came from the Irish Free State.

While more newcomers now come directly from Germany than from Great Britain, fewer immigrants from all countries were charged to the former's quota than to the latter's. This is due to a number of natives of Great Britain entering the United States by way of the northern land border, who give Canada as their last permanent residence.

During August 3156 immigrants charged to the quota for Great Britain and Northern Ireland were admitted to the United States; and of this number 1263 or 40 per cent came in over the Canadian border. In the same month, 2332 immigrants charged to the quota for Germany were admitted, more than 96 per cent of whom came directly from overseas. Of the 29,294 aliens departing from the United States, 5571 left permanently.

Chicago Employment Gain

Most of the industrial groups reporting on employment in the seventh Federal Reserve District showed a larger volume on Sept. 15 than a month earlier, according to a recent report of the Federal Reserve Bank of Chicago. The aggregate gain amounted to 0.7 per cent—the same rate of increase as reported for the preceding period. Workers in the metals and metal products, other than vehicles, increased 0.1 per cent, while employment in vehicle manufacturing plants decreased 0.6 per cent.

Although the volume of employment has been maintained at a satisfactory level, payroll amounts at industrial plants reflect a less favorable condition. All but one of the reporting industries showed a decrease in payroll totals from the preceding month.

September shipments of enameled sanitary ware totaled 314,862 pieces, against 395,542 pieces in August, according to reports received by the Department of Commerce from 22 manufacturers, comprising practically the entire industry.

Exports of Iron and Steel Lower

Despite Drop in September, Nine-Month Total Was Highest Since 1920—Imports of Finished Steel Off 20 Per Cent

WASHINGTON, Oct. 25.—Exports of iron and steel products in September were 222,408 gross tons, the lowest since last December, with a total of 221,810 tons, and 20,448 tons under the 242,856 tons exported in August, the previous low mark of the current year. Imports also declined in September, amounting to 60,974 tons, the smallest since last April, with a total of 54,337 tons, and 22,995 tons under August imports of 83,969 tons.

The sharpest decline in exports in September was in scrap, which dropped to 32,803 tons from 62,857 tons in August. Scrap was the largest item of exportation during each of the two months. Exports of black steel sheets in September decreased to 11,822 tons from 15,890 tons. Tin plate exports declined to 19,910 tons from 21,367 tons; fabricated material to 10,170 tons from 12,926 tons and steel rails to 10,070 tons from 12,926 tons.

Among the increases were those in steel bars, which rose to 16,999 tons from 11,936 tons; galvanized sheets, to 13,454 tons from 11,336 tons; plain structural material, to 21,187 tons from 5278 tons, the sharpest gain made, and black and galvanized pipe, which rose to 13,482 tons from 11,497 tons.

Only three items in the import list showed gains and all of them were light. As in the case of exports, the largest drop was in scrap, which fell to 6399 tons from 12,033 tons. The next to largest decline was in cast iron pipe, which decreased to 3478 tons from 8397 tons. Little change was reflected in the incoming movement of structural shapes, the September figure being 15,525 tons as against 15,695 tons for August. Pig iron imports decreased to 11,013 tons from 12,377 tons.

For the nine months ended with September exports totaled 2,327,635 tons, an increase of 201,573 tons over those for the corresponding period of last year, and the largest total for nine months since the abnormal movement in 1920. Imports showed a downward trend, decreasing 15,410 tons to 574,166 tons from 589,576 tons.

Of the September scrap exports, 10,891 tons went to Japan; 9961 tons to Canada; 7532 tons to Italy, and 3000 tons to Poland.

Canada was the sole buyer of 12,136 tons of skelp in September, and took

3566 tons of the 6540 tons of casing and oil line pipe exported. Of the 9910 tons of welded black pipe exported in September, 1793 tons went to Japan; 1315 tons to Canada; 1214 tons to the United Kingdom, and 777 tons to Mexico.

Total exports to Canada in September were 87,608 tons, while 29,117 tons went to Japan, 11,581 tons to the Philippine Islands, and 8922 tons to Mexico.

Of the structural shapes imported in September, 8183 tons came from Belgium, 3876 tons from Germany, and 3158 tons from France. France provided 3222 tons of the September cast iron pipe imports. Of the 2470 tons of "other pipe" imported during that month, 836 tons came from Germany, 691 tons from Canada, 542 tons from the United Kingdom, and 382 tons from Sweden. Sweden was the largest source of incoming shipments of steel bars in September, furnishing 1313 tons, while 1116 tons came from Belgium, 695 tons from France, and 324 tons from Germany.

Canada led as the source of supply of ferromanganese imports, providing 1968 tons out of the total of 2525 tons, while 312 tons came from the United Kingdom. Of the 13,123 tons of manganese ore concentrates imported in September, 7200 tons came from Soviet Russia, 2600 tons from India, 2439 tons from the Gold Coast of Africa, and 839 tons from Brazil.

Belgium was the greatest source of imports in September, supplying a total of 13,238 tons, while Canada was a close second, with 12,917 tons. Germany furnished 10,933 tons, and France, 8756 tons.

Further Reduction in Iron Ore Imports

September imports of iron ore are reported by the Department of Commerce at 246,917 gross tons, a drop of 17 per cent from the 298,013 tons of August. The current figure is, however, 17 per cent higher than the 211,494 tons of September, 1928. The August total was the third largest in more than six years.

In the elapsed portion of the year an increase over last year is shown of 427,000 tons, which represents 22.5 per cent. This makes the year, so far, the heaviest in our history, as it has exceeded the previous high record, made in 1923, by a fraction of 1 per cent. The 1923 total in nine months was 2,297,144 tons, which now is bettered by 17,000 tons.

Chile continues to supply the largest share of the imports, which, however, dropped in September for the first time in some months to a little less than one-half the total. For the nine months, however, Chile's proportion was about 52 per cent. Cuba, Sweden, French Africa and Spain followed in that order, both for September and for the nine months. This is somewhat different from the line-up of a year ago, when Sweden supplied no ore during the month and a low amount in the nine months, owing to an extensive strike in the Swedish mines.

SOURCES OF AMERICAN IMPORTS OF IRON ORE

To Air Steel Window Trade Practices

WASHINGTON, Oct. 28.— Commissioner Charles H. March of the Federal Trade Commission will preside at a trade practice conference which has been authorized for the solid-section steel window industry, the time and place of which have not been scheduled.

Applicants for the conference, according to the commission, represent 100 per cent of the manufacturers of solid-section steel windows east of the Rocky Mountains. Several manufacturers on the Pacific Coast have not yet indicated a desire to take part.

Among practices proposed for discussion are: Publication of prices, proper handling of commodity and engineering sales, inducing breach of contract, misbranding and misrepresentation, secret rebates, dumping and making less-than-carload sales at carload prices.

Thomas Process Jubilee by British Steel Company

Bolckow, Vaughan & Co., Middlesbrough, England, have issued a booklet in commemoration of the fiftieth anniversary of the successful completion of a series of experiments at their Cleveland steel works by Sydney Gilchrist Thomas and Percy Carlyle Gilchrist. These experiments, which resulted in the development of the basic-Bessemer process of steel-making, were revolutionary and have affected the industry ever since.

The story of the two inventors is one of difficulty and poverty. Thomas was to be a physician, but his father's death when he was only 17 years old made such a career impossible. He became assistant master at a private school in Essex, and then a junior clerk in the metropolitan police courts. His salary was £90 ($450) a year, and he remained in that position for 12 years. Probably few suspected that the young police court clerk had inventive ability.

A chance phrase about the Bessemer converter heard at a Birkbeck Institute lecture when he was 20 fired his imagination. He attended classes in mineralogy, and after a little while enlisted the help of his cousin, Gilchrist, who was a chemist at a South Wales works. Out of his small salary as a clerk, Thomas managed to save £800 ($4,000). This the two men spent on research, and finally patented their process. The results were embodied in a paper which came to the notice of the manager of Bolckow, Vaughan & Co., with the result that the new process was given a trial. The revolution of steel manufacture was thus begun. Thomas did not live long to enjoy the fruits of his success, for he died when he was only 35 years old.

Canton Rolling Mills to Make Coated Alloy Sheets

The Canton Rolling Mills Corporation, Canton, Ohio, which some months ago bought the plant of the Falcon Tin Plate Co., announces that the mill is now being electrified and new equipment, including continuous heating furnaces and Streine automatic shearing equipment, is being installed. The mill is being changed over from tin plate and black plate sizes so that it will roll full finished and coated alloy sheets up to 48-in. wide and 168-in. long. Officers of the company are: President, Alvin L. Bear; secretary-treasurer, Godfrey M. Cohn; vice-president, Charles M. Easterly. In addition to the above, the directors are: William H. Lotts, Milo C. Hagen, Theodore E. Rein and William T. Martersteck. Mr. Martersteck is plant engineer and works manager.

The Internal Revenue Bureau has announced the refund of an income and profits tax of $294,141 to the Youngstown Sheet & Tube Co.

Machinery Exports Decline Further

But Nine-Month Total Is Nearly $100,000,000 Above Previous High Record—Imports Up in Nine Months

WASHINGTON, Oct. 25.—Continuing their downward trend, exports of machinery of all kinds declined to a value of $46,984,546 in September from $50,178,881 in August, a drop of $3,194,335, or 6.2 per cent. For the nine months ended with September, however, exports of machinery were valued at $462,554,128, against $365,342,219 for the corresponding period of last year, an increase of $97,211,909, or 26.9 per cent. When compared with September, 1928, with a value of $33,457,410, exports last month showed a gain of $13,527,136, or 40 per cent.

For the third quarter a total of $154,139,000 was made, second only to the $155,939,000 in the first quarter of this year and far higher than in any quarter of any preceding year. The nine-month total is a new record, exceeding the previous high, that of 1928, as above.

Exports of machinery and vehicles in September were valued at $85,314,591, against $90,453,070 in August, a decline of $5,138,479, but an increase of $16,666,796 over similar exports of $68,647,795 in September of last year. For the nine months ended with September exports of machinery and vehicles were valued at $955,120,919, an increase of $188,356,938 over similar exports ($766,782,012) for the corresponding period of 1928.

Exports in September of industrial machinery, as classified by the Division of Statistics, Department of Commerce, were valued at $23,248,731, a slight increase over those in August, valued at $23,154,869, and a gain of $8,532,413 over similar exports in September of last year. For the nine months ended with September industrial machinery exports were valued at $210,291,813, compared with $163,026,202 for the corresponding period of last year, an increase of $47,265,611, or 29 per cent.

Exports of power-driven metal-working machinery, as listed in THE IRON AGE table, numbered 944 units, valued at $1,595,716, in September, against 894 units, valued at $1,342,908, in August.

Nine-Month Imports Show Sharp Gain

Imports of machinery and vehicles in September were valued at $3,115,744, against $3,493,152 in August, a decline of $377,408. Compared with $2,226,411 in September of last year, there was a gain of $889,333. For the nine months ended with September imports of machinery and vehicles were valued at $32,505,207, compared with $21,194,772, reflecting the sharp gain of $11,310,435, or 53.4 per cent. Imports of industrial, office and printing machinery in September were valued at $1,985,300, an increase of $98,420 over those in August, valued at $1,886,880, and a gain of $540,630 over similar imports for September of last year, valued at $1,444,670. For the first nine months of 1929, imports of industrial, office

and printing machinery were valued at $18,648,152, representing the high increase of $5,426,540, or 24.4 per cent over similar imports for the corresponding period of last year.

Imports of machinery, as listed in THE IRON AGE table, were valued at $2,138,908 in September, compared with $2,602,309 in August, a decrease of $463,401, but an increase of $493,037 over similar imports in September of last year. For the first nine months of 1929 they were valued at $24,773,525, an increase of $8,558,055, over the same period of last year.

Where Steel Exports Went in Nine Months

Canada Took 550,679 Tons of Nine Leading Items—Japan Retains Second Position with 115,654 Tons, Followed by Argentina, 41,392 Tons; Philippines, 38,370 Tons; Mexico, 35,027 Tons

Exports from United States, by Countries of Destination

European Steel Markets Less Active

Forward Business Slower and Exports Fall—Reduced Output in Germany—Turkey to Make Steel

(*By Cable*)

LONDON, ENGLAND, Oct. 28.

WHILE Cleveland furnaces are satisfactorily engaged for the next few weeks, forward business is not developing very well and producers are somewhat pessimistic, as costs are not decreasing and lower pig iron prices are impracticable at present.

Continental material is being offered in restricted quantities, but consumers are cautious in buying. Hematite iron is moderately active, but furnaces are not pressing for business, asserting that the price should be fully £4 ($19.40) a ton. As a result, some pig iron is now going into stock.

Domestic business in finished steel has increased slightly, but export is still generally quiet. Foreign competition abroad is hampering expansion, but British makers are unable to reduce prices and in some cases are considering advances.

Tin plate is active, but prices are easier, as tin has declined in price. Mills are well booked for several months and export markets are inquiring for considerable tin plate. An Eastern oil can tin plate order for about 1,000,000 boxes is expected to be placed here at an early date.

Galvanized sheets are quiet and prices have declined further based on low priced foreign steel. Spelter makers are meeting Friday to discuss the market situation. Black sheets continue inactive.

The Continental market is disorganized by lack of buying and continually receding prices and makers are meeting today to discuss the question of stabilization through a central sales office.

Belgian production in September was 347,000 metric tons of pig iron, 337,000 tons of raw steel and 288,000 tons of rolled steel products. On Sept. 30, 57 furnaces were in blast.

German output in September was 1,230,000 metric tons of raw steel and 906,000 tons of rolled steel products. Luxemburg production in September was 240,000 metric tons of pig iron and 223,000 tons of raw steel.

Agreement Reached For British Steel Merger

LONDON, ENGLAND, Oct. 19.—A provisional agreement for the acquisition of assets and liabilities of Bolckow, Vaughan & Co., Ltd., by Dorman, Long & Co., Ltd., has been signed by both parties. Under its terms stockholders of Bolckow, Vaughan & Co. will exchange their shares for securities in Dorman, Long & Co. In the announcement of the provisional agreement it is stated by the companies that they have identical iron, steel and engineering interests, equipment, raw materials and steel production and supply the same markets, so that the merger offers both considerable benefit. Directors of the companies have recommended acceptance of the agreement.

When the merger is completed the new corporation will have a share capital stock of £11,248,146 ($54,553,508) and debenture stock of £5,855,773 ($28,400,499). The permanent name of the merged companies will be Dorman, Long & Co., Ltd., but for a time it will appear with the phrase, "incorporating Bolckow, Vaughan & Co., Ltd."

British Light Their Largest Coke Oven

LONDON, ENGLAND, Oct. 19.—The largest coke oven in the United Kingdom has been placed in operation at Chapeltown, Sheffield, by Thorncliffe Coal Distillation, Ltd. It will use 1200 tons of coal a day and produce 840 tons of coke, 8,000,000 cu. ft. of gas, 12,000 gal. of tar, 17 tons of ammonia sulphate and 3000 gal. of benzol. Half the gas will be conveyed by a six-mile main to the Sheffield Gas Co.

Sir Samuel Roberts, M. P., speaking at the plant when the oven was lighted, said that surplus gas could also be used for generating electricity and that there is a great future for colliery companies which generate electricity on a large scale.

German Beryllium Output Increases

Further Price Reduction Expected Soon — Alloyed with Copper It Has Unusual Strength and Elasticity

HAMBURG, GERMANY, Oct. 14.—In recent months the price of beryllium has been reduced to 1000 m. ($238) per kg., or $108 per lb., a little more than half the present price in the United States. The reduction was made possible by improvements in production by the Siemens & Halske A. G., the leading German maker. The company is now planning a new beryllium plant with a capacity of 100 kg. a month, and it is expected that the price will be further reduced to 700 or 800 m. ($167 to $190) per kg., or $76 to $86 per lb.

The Siemens & Halske A. G. is producing beryllium electrolytically by using beryllium double fluoride. The product is 98 per cent Be, 1 per cent Fe and 1 per cent impurities; it is hard but brittle. Beryllium, 99.5 per cent pure, is used for X-ray equipment. Its principal use, however, is as an alloy of steel, aluminum, copper or other metals. The chief alloy being produced in Germany today is copper-beryllium with 2.50 per cent Be. It is claimed by its makers to have six times the hardness and five times the fatigue resistance of copper, and by proper heat treatment, it is said, these properties can be greatly increased. Beryllium bronze, with 2.50 per cent Be, is claimed by producers to compare favorably with the best chromium spring steel.

An important quality claimed for the beryllium alloys is their extreme elasticity, exceeding that of other elastic metals. Tests are said to show that beryllium bronze springs will withstand two to three times the use of high-quality steel springs without showing fatigue. Flat springs of beryllium-bronze have been tested up to 15,000,000 vibrations without breaking, it is stated. Beryllium bronze springs are claimed to have shown under test that they are four and a half times stronger than brass springs and two and a half times stronger than nickel steel or phosphor bronze springs. Copper wire alloyed with 2.50 per cent Be is said to have greater electrical conductivity than other non-ferrous metal alloys.

Tests have shown that beryllium alloys can be welded, rolled or drawn into any required shapes, it is reported. Investigation is now being made of beryllium alloyed with nickel and cobalt, and the Friedrich Krupp A. G. is investigating it as an alloy of Nirosta. Beryllium alloys are being used in Germany by the electrical and spring manufacturing industries.

German Export Trade Quiet

Affected by Depression in Other Continental Markets— Locomotive Builders Report Better Business

BERLIN, GERMANY, Oct. 10.—Steel activity has declined somewhat in the past fortnight, partly in sympathy with the weakness evident in other Continental markets. While the total number of unemployed in Germany is 170,000 more than at the same date in 1928, there has been the usual fall increase in industrial personnel and the surplus of unemployed is considered as a normal result of increasing population.

Production continues high. Coal output in the first eight months of this year was 107,300,000 metric tons, 6,000,000 tons more than in the same period of 1928. Pig iron production in the first nine months of this year was 10,049,048 tons, compared with 9,638,384 tons in nine months of last year. The continued high production of iron and steel, despite a weaker market, is believed to be the result of many mills producing for stock rather than to curtail operations and reduce their personnel. Certain mills, however, have begun to curtail, among the leaders being the Friedrich Krupp A. G. and the Gutehoffnungshütte.

Export trade is decidedly inactive and the latest returns, which are for August, show net exports of 355,000 tons of heavy iron and steel. This is larger than the monthly average for 1928 of 219,000 tons, but new business is coming in slowly. The Hamburg Steel Export Association complains that Belgian and French sellers are shading prices, but it is noteworthy that German mills also have reduced export quotations by several shillings a ton in some instances. While there have been some sizeable foreign orders for heavy-gage sheets and the prices have not been reduced, the demand is declining.

The Friedrich Krupp A. G., Essen, reports good business in locomotives and has under construction 75 steam-driven engines, of which 60 are for export to India. In addition the works is building a number of Diesel-driven locomotives. Other locomotive builders also report improved foreign business. Exports of locomotives this year show increased shipments to France, Holland, British South Africa, Denmark, Spain, Bolivia and Colombia. Deliveries to Russia have declined.

While exports of steam boilers for locomotives have declined, shipments of boilers for other purposes show an increase. The total weight of all boilers shipped in the first seven months of this year was 11,700 tons, compared with 8400 tons in the same period of 1928. Shipments to Russia and the Dutch East Indies and to France on reparations have been better.

The Railroads Corporation is generally limiting its purchases of materials to equipment for replacement only, and the financial condition of municipalities has checked demand for street cars and equipment.

Leading manufacturers of cable have formed a corporation in which all are shareholders. The companies included are C. J. Vogel Draht und Kabelwerke, Deutsche Kabelwerke, Deutsche Telefonwerke und Kabelindustrie, Norddeutsche Kabelwerke, Kabelwerk Rheydt and Hackethal Draht und Kabelwerke of Hanover.

Krupp Builds Brass Foundry in India

HAMBURG, GERMANY, Oct. 14.—The Grusonwerk of the Friedrich Krupp A. G., Essen, is executing a contract for construction and equipment of a brass foundry and rolling mill in Bengal, India. The new plant, the first of its kind in India, will have a rated capacity of 400 to 500 tons a month.

India Buys Car Axles in Belgium

HAMBURG, GERMANY, Oct. 14.—While steel rail prices are controlled by the International Rail Makers' Association, other railroad material prices are decidedly weak. Recently the India Stores Department inquired for several thousand tons of railroad car axles and other material for cars. The British bidder quoted £13 10s. ($65.47) per ton, f.o.b. port, the German bid was £11 2s. 6d. ($53.95) per ton, f.o.b. port, a works in the Saar quoted £10 ($48.50) per ton, f.o.b., and a Belgian maker received the order at £8 ($38.80) per ton, f.o.b. Antwerp.

Contract Awarded for New Turkish Steel Mill

HAMBURG, GERMANY, Oct. 14.—A contract for the construction and equipment of a new steel plant for the Turkish Government near Angora has been awarded to three German companies. The designs of the buildings and the material will be furnished by the Gutehoffnungshütte A. G., the machinery by DEMAG and the electrical equipment by the Allgemeine Electricitäts Gesellschaft. The cost of the plant, exclusive of the cost of construction, will be about 17,000,000 m. ($4,046,000). It will be ready for operation by April, 1931, and payment will be made in six annual instalments. Bars, beams, hoops and pig iron will be produced. A wire mill is to be built later. The new

works will use Anatolian iron ore of high quality and will obtain coal from the Eregli mines.

German Steel Works Report Shows Reduced Output

DÜSSELDORF, GERMANY, Oct. 14.—The report of the Vereinigte Stahlwerke A. G. for its fiscal year ended Sept. 30 shows a total production for the 12 months of 6,007,739 metric tons of pig iron, 6,419,796 tons of steel ingots, 27,241,000 tons of coal and 9,604,032 tons of coke. While coal and coke output showed an increase from the previous 12 months, pig iron registered a decline of 500,000 tons and steel of 550,000 tons.

The total number of employees at the end of September was 176,716, and the value of all products sold was 1,433,338,000 m., of which 529,038,000 m. was received from export trade. On this basis exports of the company were 37 per cent of the total business, compared with 31 per cent in the previous year. Orders on books represented a decrease from a year ago, being 81.9 per cent of the total at the end of September, 1928.

Pig Iron Imports Decline in September

Imports of pig iron into the United States in September were 11,013, gross tons, a reduction of about 10 per cent from the August total of 12,377 tons, but more than 5 per cent higher than the incoming shipments of September, 1928.

For the nine elapsed months of the year the incoming shipments, at 103,594 tons, were about 1 per cent higher than a year ago and represented the largest such total since 1926, when about 394,000 tons came in in that period.

British India again supplied the lion's share, with Canada in second position and Netherlands and United Kingdom, which usually are large shippers of pig iron, far below the two leaders. This is in sharp contrast with the situation in September, 1928, when Netherlands stood first, British India second and United Kingdom third, while Canada supplied no pig iron whatever.

In the nine months British India has taken away from the United Kingdom the leadership which the latter had in 1928. Netherlands stands third in both years.

Canadian Lignite Mines May Buy German Equipment

HAMBURG, GERMANY, Oct. 14.—Manufacturers of mining equipment in Germany are negotiating with the companies in Canada planning to begin operations in the lignite mines in Ontario. Earlier this year the new Australian lignite mines and briquetting plants installed German equipment following inspection of the mines in central Germany.

To Build Russian Ships

HAMBURG, GERMANY, Oct. 14.—The Russian trade delegation at Berlin has placed contracts with German yards for 14 ships, including six coastal vessels placed with the Nordseewerke, controlled by the Vereinigte Stahlwerke A. G., six vessels awarded to the Schichauwerft and two cargo steamers ordered from another German yard. In addition, contracts have been placed for machinery and other equipment for a new aluminum plant to be constructed at Nowosibirisk.

86 Per Cent Adherence to Simplified Schedules

Average adherence to recommendations for 27 simplified practice programs reviewed by the Division of Simplified Practice during the fiscal year 1929 was 86 per cent. The average adherence obtained through 79 resurveys made since 1922, when the Department of Commerce, under Herbert Hoover, then its secretary, organized the work, was 83 per cent. The total number of individual firm acceptances to June 30, 1929, amounted to about 20,790.

Fourteen typical industries which have cooperated with the department in establishing simplified practice recommendations estimate their total savings at approximately $240,000,000, according to the Bureau of Standards.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT
(In Gross Tons)

	September		Nine Months Ended September	
	1929	1928	1929	1928
United Kingdom	651	2,225	31,338	39,552
British India	6,485	3,758	44,271	38,027
Germany	.....	.....	103	95
Netherlands	693	4,159	19,722	21,832
Canada	2,709	.....	3,472	378
France	.....	.....	101	300
Belgium	.....	.....	184	202
Norway	420	263	1,861	675
Sweden	25	.....	1,440	2,143
All others	30	32	602	1,573
Total	11,013	10,437	103,594	104,777

Large Savings Attributed to Simplified Practice

Industry's own evaluation of the results that have attended its effort to eliminate avoidable waste through adherence to the principles of simplified practice shows that 10 of the 105 active simplified practice recommendations are producing an annual saving of $300,000,000, Edwin W. Ely, chief, Division of Simplified Practice, Department of Commerce, Washington, said in an address recently before the manufacturers' section of the American Gas Association at Atlantic City.

Uses of Abrasives Depicted in Film

Grinding and polishing operations are pictured in an educational motion picture film, "Manufactured Abrasives," produced by the United States Bureau of Mines, in cooperation with a large industrial concern.

While natural abrasives, such as sandstone, flint and emery, formerly served, modern industry must have harder, sharper and more efficient grinding materials, it is pointed out. This need is largely met by manufactured abrasives such as are made in electric furnaces operated by power generated at Niagara.

Several widely used abrasives are featured. Their utilization in a wide variety of industrial operations is shown in some detail.

Copies of the film may be obtained for exhibition purposes by schools, churches, clubs, civic and business bodies, miners' unions, engineering societies and others interested, by applying to the Pittsburgh Experiment Station of the United States Bureau of Mines, Pittsburgh. No charge is made for the use of the film, but the exhibitor is asked to pay transportation charges.

Manufacture of snow traveling devices for automotive use will be concentrated in the New Holstein, Wis., plant of the Snow Flyer Co., following the purchase by that concern of the plant, patents and other assets of the Snowmobile Mfg. Co., West Ossippi, N. H. The New Hampshire plant will continue in operation throughout the winter busy season before the consolidation of production is finally completed. The New Holstein officers, including A. L. Langenfeld, president, and Paul Langenfeld, secretary-treasurer, will continue in the same capacities in the consolidated company.

The Youngstown Sheet & Tube Co. has contracted with the Semet-Solvay Engineering Corporation, New York, for the installation of equipment for refining light oil and producing motor benzol, toluol and solvent naphtha at its by-product coke oven plant at Indiana Harbor, Ind. Equipment will be housed in a new building, the construction of which is now under way.

Machinery Markets and News of the Works

Tool Orders Trend Upward

October Bookings Are Likely To Exceed Those of September by Comfortable Margin

ALL machine tool centers report an improvement in sales the past week with the result that October bookings are likely to exceed those of September by a comfortable margin.

Inquiries also are in larger volume and give promise of a steady demand for equipment during the remainder of the year. The collapse in the stock market has not been discernible in business as it affects machine tool buying and in some quarters the opinion prevails that the good effects of easier money conditions may counterbalance whatever adverse results there may be.

Members of the National Machine Tool Builders' Association, assembled in annual convention last week at Briarcliff Manor, N. Y., were optimistic about the outlook and are confident that the months ahead will bring a steady flow of orders.

Although sales have been distributed among a wide range of industries and individual transactions have largely been confined to one to three tools each, the market has not been entirely devoid of buying on a sizable scale.

A New Jersey machinery manufacturer has bought a number of radial drills as well as other equipment and the Amtorg Trading Corporation has contracted for 26 lathes with a Cincinnati builder.

The Hercules Motor Co., Canton, Ohio, is expected to purchase a list of tools for expansion purposes. The general purchasing officer for the Panama Canal Zone is asking for bids on a planer, several drilling machines and lathes and miscellaneous mechanical supplies. Another user is in the market for six planers.

Business from the automobile industry has been of negligible proportions.

New York

NEW YORK, Oct. 29.—Machine tool business for October in the New York district will surpass that of September, when orders declined somewhat, presumably because of the National Machine Tool Exposition in Cleveland. The collapse in the stock market has not yet been discernible in business as it affects machine tool buying. In some quarters the opinion prevails that the good effects of easier money conditions may counterbalance whatever adverse results there may be.

A large order for radial drills and other equipment has been placed by a New Jersey machinery manufacturer. Otherwise, business has been in small, scattered lots, but the aggregate has been good. Inquiries are numerous, giving rise to expectations that the volume of machine tool buying will be well sustained over the remainder of the year.

Kohler Co., 711 Fifth Avenue, New York, manufacturer of sanitary ware, with main plant and headquarters at Kohler, Wis., has asked bids on general contract for a six-story factory branch, storage and distributing plant at Long Island City, to cost over $200,000 with equipment. Buchman & Kahn, 2 Park Avenue, New York, are architects.

Hudson Wire Co., Water Street, Ossining, N. Y., has begun superstructure for a one-story addition, 100 x 125 ft., for which general contract recently was let to Delfino & Sylvester, North Highland Avenue, to cost about $75,000 with equipment.

M. J. Ort, 424 East 149th Street, New York, architect, has plans for a six-story automobile service, repair and garage building, to cost about $200,000 with equipment. Same architect has filed plans for two-story service, repair and garage building, 150 x 160 ft., to cost about $100,000 with equipment.

Tomkins Brothers, 74 Passaic Street, Newark, N. J., building materials and supplies, have asked bids on general contract for a branch storage and distributing plant at Mount Vernon, N. Y., two stories, to cost about $70,000 with conveying and mechanical-handling equipment. Robert Bolton, 45 Branford Place, Newark, is architect.

General Baking Co., 420 Lexington Avenue, New York, will install traveling ovens, power, conveying and other equipment in connection with an expansion program during 1929-30, to cost $8,000,000, including construction of six new baking plants and modernization of 12 other plants.

Third Avenue Railroad Co., 2396 Third Avenue, New York, has awarded general contract to J. D. Clermont, 145 East Forty-fifth Street, for two-story addition to motor bus parts and repair shop on West Farms Road, near 172nd Street, to cost about $35,000. E. H. Faile & Co., 441 Lexington Avenue, are architects.

Board of Education, Park Avenue and Fifty-ninth Street, New York, is considering installation of manual training equipment in new Walton High School in Bronx, for which plans will be completed by W. C. Martin, school architect, Flatbush Avenue Extension and Concord Street, Brooklyn, to cost $2,250,000.

Research Corporation, 25 West Forty-third Street, New York, manufacturer of air and gas cleaning apparatus, etc., has awarded general contract to Y. D. Bakker Co., Bound Brook, N. J., for one-story and basement addition to plant at Bound Brook, 50 x 80 ft., to cost about $30,000 with equipment. John N. Pierson, 196 Jefferson Street, Perth Amboy, N. J., is architect.

Officials of General Motors Corporation, Broadway and Fifty-seventh Street, New York, and its affiliated organization, Fokker Aircraft Corporation, Hasbrouck Heights, N. J., have formed Dornier Corporation of America, Inc., a subsidiary, capitalized at 50,000 shares of stock, no par value, to manufacture Dornier flying boats, now being produced by Dornier Metallbauten, Friedrichshafen, Germany, and for which American rights have been secured. Plans are being considered for construction of aircraft plant for Dornier flying boats in New York district, including parts and assembling departments, to cost more than $100,000 with equipment. Dr. Claude Dornier, head of Germany company, will be identified with new organization.

Steel Equipment Corporation, Avenel, N. J., manufacturer of steel shelving and other steel products, has plans for a two-story addition, to cost about $45,000 with equipment.

Pennsylvania Dock Co., 25 Church Street, New York, affiliated with Pennsylvania Railroad Co., Pennsylvania Terminal, has awarded general contract to F. H. McGraw, Inc., 51 East Forty-second Street, for eight-story cold and dry storage and refrigerating plant, 230 x 900 ft., at Jersey City, N. J., to cost $1,200,000 with equipment. George F. Bial, 147 Summit Avenue, Union City, N. J., is associate architect.

Accurate Engineering & Mfg. Co., 750 Summer Avenue, Newark, manufacturer of radio equipment and parts, has leased part of four-story building at Murray and Austin Streets for expansion.

National-Harris Co., 195 Verona Avenue, Newark, manufacturer of fine wires, etc., occupying part of former plant of

Heller Brothers File Works, Inc., has taken over another building for expansion in rolling division, increasing floor space to 30,000 sq. ft. Negotiations are under way for purchase of entire plant for wire manufacture. Early next year offices will be removed to building at Mount Prospect and Verona Avenues and vacated space equipped as new experimental laboratory. Francis R. Harris is president.

Seither & Ellis, Inc., 313 Halsey Street, Newark, heavy mill and hardware equipment and supplies, has purchased three-story and basement building, 50 x 100 ft., and will remodel for new storage and distributing plant. Possession will be taken in about 30 days. Present plant will be removed to new location.

Eastern Tool & Mfg. Co., 129 Bloomfield Avenue, Bloomfield, N. J., manufacturer of tools, wire goods, etc., has taken option on local property and contemplates new plant to cost more than $70,000 with equipment.

Arcoil Oil Burner Co., 124 Commerce Street, Newark, manufacturer of oil burning equipment, aluminum fans, etc., has leased one-story factory at 81-83 Pennington Street, with option to purchase, for new plant.

Contract for operating mechanism of new Hackensack River freight line bridge has been awarded to Gears & Forgings, Inc., Cleveland. Bridge is of Waddell-Hardesty vertical lift type and is being erected for Pennsylvania Railroad.

South Atlantic

BALTIMORE, Oct. 28.—Plans are being considered by Williamsport Wire Rope Co., Williamsport, Pa., for one-story addition to plant at Sparrows Point, Baltimore, to cost about $35,000 with equipment.

Baltimore Paper Box Co., Key Highway, Baltimore, manufacturer of corrugated paper boxes and containers, is planning establishment of branch factory at Salisbury, Md., and will take over existing building and install machinery during November, to cost about $30,000.

Benedict Coal Co., St. Charles, Va., will carry out expansion at mining properties to cost about $200,000, including addition to tipple, and surface and underground machinery.

Virginia Public Service Co., Charlottesville, Va., has acquired 12,000-acre tract at Greaver's Mill, near Covington, Va., as site for hydroelectric power development, for which plans will be placed under way at once. Plant will be equipped for capacity of 100,000 hp., and will cost about $2,000,000 with transmission system. A. W. Higgins is president.

General Motors Corporation, Detroit, has plans for two-story service, repair and sales building at Baltimore, to cost over $100,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Schofield Co., 2 East Saratoga Street, Baltimore, manufacturer of silverware, metal plated goods, etc., is considering new three-story plant unit, to cost about $65,000 with equipment.

In connection with electrification program in Philadelphia district, Pennsylvania Railroad Co., Philadelphia, has arranged with city of Baltimore for continuation of work in that section, extending from Wilmington, Del. Development will include construction of two large warehouses with mechanical-handling facilities in Baltimore. Entire program will cost $30,000,000.

Byars Mfg. Co., Thomasville, N. C., recently formed by George W. Byars, Thomasville, and associates, with capital of $100,000, is planning operation of local factory to manufacture patented window screens and kindred products. L. C. Ripple, Thomasville, will be an official of new company.

Sylvania Corporation, Fredericksburg, Va., has superstructure in progress for local mill to manufacture transparent paper products, and expects to have initial unit ready for service in 60 to 90 days. Project will include a machine shop, power house and other mechanical divisions, and will cost about $1,000,000 with equipment.

Appalachian Electric Power Co., Roanoke, Va., is planning extensions and improvements in steam-operated electric power plant at Logan, W. Va., including installation of boiler, stoker, mechanical fans and auxiliary equipment.

Haywood County Board of Education, Waynesville, N. C., is considering installation of manual training equipment in new high school at Canton, N. C., to cost about $140,000, for which plans will be prepared by V. W. Breeze & Co., Castanea Building, Asheville, N. C., architects.

D. A. Stickell & Sons, Inc., Hagerstown, Md., plans rebuilding five-story flour mill and grain elevator destroyed by fire Oct. 19, loss including hoisting, conveying and other mechanical equipment.

The Crane Market

INQUIRY for overhead traveling cranes is light and buying in the past week has been small. In the locomotive crane field the Baltimore & Ohio Railroad has closed on two more 25-ton, Diesel-engine-driven locomotive cranes with the Industrial-Brownhoist Corporation, bringing the total number of this type of crane it has purchased this year to 10. The New York Central Railroad still has a 150-ton wrecking crane, 50-ton steam driven locomotive crane and 25-ton gasoline driven crane, pending award. The Chicago, Milwaukee & St. Paul has bought a 25-ton gantry crane for use in Chicago and will later order a duplicate for Milwaukee.

Among recent purchases are:

Sauerman Brothers, Chicago, 10-ton, 2-motor, overhead crane through H. C. Sturman & Co., from H. D. Conkey & Co.

Chicago, Milwaukee & St. Paul, 25-ton, 58-ft. span, gantry crane for Chicago, from Milwaukee Electric Crane & Mfg. Corporation.

Philadelphia

PHILADELPHIA, Oct. 28.—Morris Wheeler & Co., Inc., Thirtieth and Locust Streets, Philadelphia, iron and steel products, has plans for new one-story steel fabricating plant, 240 x 420 ft., to cost more than $200,000 with equipment. Julian Simsohn, Broad Street and Girard Avenue, is architect and engineer.

Mack Machine Co., Inc., 1708 North Front Street, Philadelphia, manufacturer of ice and refrigerating machinery, has leased additional space at address noted and will use as an assembling plant.

Standard Oil Co., Sixth and Chestnut Streets, Philadelphia, has awarded general contract to Lutz & Co., Inc., 2218 Chestnut Street, for one-story storage and distributing plant at West Chester, Pa., to cost about $40,000 with equipment.

I. Fischman & Sons, Inc., Tenth Street and Allegheny Avenue, Philadelphia, manufacturer of soda fountains and equipment, has leased part of former plant of Baldwin Locomotive Works, Fifteenth and Spring Garden Streets, for storage and distributing plant. Mechanical handling and other equipment will be installed.

Empire Art Metal Mfg. Co., Philadelphia, has been organized with capital of $100,000 to take over and expand company of same name with plant at 3036 North Broad Street. Clarke D. and M. W. Hunter head new organization.

Stanley S. Cramer, Copewood and Thorne Streets, Camden, N. J., has filed plans for a one-story foundry, 40 x 85 ft., to cost about $25,000 with equipment.

Pennsylvania Power & Light Co., Allentown, Pa., will build an addition to machine shop on Cedar Street, Harrisburg, Pa., and will make other improvements in equipment storage and distributing plant at that location, to cost about $25,000.

City Council, Atlantic City, N. J., has plans for a two-story municipal equipment storage and distributing plant, with service, repair and garage building, to cost about $75,000 with equipment. A. F. Amodio, New York and Atlantic Avenues, is architect.

Board of Education, Yardley, Pa., is considering installation of manual training equipment in new high school, to cost $160,000, for which plans will be drawn by Heacock & Hokanson, 1211 Chestnut Street, Philadelphia, architects.

New England

BOSTON, Oct. 28.—Machine tool business is better than in the previous few weeks, but no intimation is given as to when equipment under negotiation is likely to be closed. This is generally attributed to a falling off in manufacturing schedules of metal-working plants, the uncertainty of the automotive situation and to over-production in the airplane industry. Demand for used tools of certain types continues good, but sales are comparatively small, due to the scarcity of such equipment. New England machine tool dealers in general report that October sales were from a third to a half under those in September.

Small tool sales hold up well, but business is more or less handicapped by deliveries.

Bridgeport Boiler Works, Bridgeport, Conn., has plans for a one-story, addition, 146 x 100 ft.

Dupont Viscoloid Co., Leominster, Mass., has closed bids on six plant units. Motors and miscellaneous equipment will be purchased.

Electric Specialty Co., Stamford, Conn., is taking bids on a two-story addition, 44 x 120 ft. Bench and other small equipment will probably be purchased.

Brownsville Maine Slate Co., Brownsville, Me., has plans for revamping its plant and installation of new equipment at a cost of $100,000.

Connecticut Department of Institutions has plans for a power house at State training school, Mansfield, Conn.

Fairfield County Ice Co., Stamford, Conn., is taking bids on a one-story ice

plant, 124 x 220 ft., requiring miscellaneous electrical and conveying equipment.

Terry Steam Turbine Co., Hartford, Conn., closed bids Oct. 29 on a boiler plant, 50 x 50 ft.

Norman Hoffman Bearing Corporation, Stamford, Conn., has closed bids on a manufacturing plant.

Chamber of Commerce, Bellows Falls, Vt., E. O. Squires, secretary, is at head of project to construct airport at North Charlestown, N. H., for service at first noted place, including hangar, repair and reconditioning shop and other field units, to cost more than $60,000 with equipment.

Congdon & Carpenter Co., 155-73 Canal Street, Providence, R. I., iron and steel products, heavy hardware, etc., has awarded general contract to Charles B. Maguire Co., Grosvenor Building, for multi-story storage and distributing plant, 246 x 325 ft., to cost $250,000 with equipment. Jenks & Ballou, New Industrial Trust Building, are architects and engineers.

Municipal Airport Committee of City Council, New Haven, Conn., has plans for municipal airport, with hangars, repair shops, oil storage and other units, to cost $300,0000 with equipment. Westcott & Mapes, 139 Orange Street, are architects and engineers.

International Silver Co., Meriden, Conn., is considering multi-story addition adjoining factory K, to cost more than $100,000 with equipment.

Hood Rubber Co., Nichols Avenue, Watertown, Mass., has asked bids on general contract for a two-story addition, to cost about $45,000 with equipment.

Bird Machine Co., South Walpole, Mass., manufacturer of paper mill machinery, parts, etc., has plans for one-story addition to cost about $40,000 with equipment.

Pittsburgh

PITTSBURGH, Oct. 28.—Machinery business in this district is keeping up well. The problem of making deliveries, however, is still serious with some dealers, particularly on special tools. Railroad budgets for next year's purchases are being made up and local sales offices are taking keen interest in view of the fact that railroad tool purchases this year have not been nearly so large comparatively as those of industrial companies.

Sizable new inquiries have come out in the past week, and the aggregate of miscellaneous needs has been large. Purchases are also being made from time to time, but small orders predominate. The Westinghouse Electric & Mfg. Co. is buying against its fourth quarter list, but purchases probably will be scattered over the remainder of the year.

Plans are being considered by Columbia Radiator Co., Walnut Street, McKeesport, Pa., manufacturer of radiators, boilers, etc., for one-story foundry and machine shop, 100 x 200 ft., to cost over $150,000 with equipment.

Allegheny River Mining Co., Kittanning, Pa., is planning early rebuilding of coal tipple at its Furnace Run mining properties, destroyed by fire Oct. 18.

Officials of Westinghouse Air Brake Co., Westinghouse Building, Pittsburgh, are organizing Westinghouse Automotive Brake Co., to take over and expand automobile brake division of parent company. Increased production will be carried out.

Waddingham Tractor & Equipment Co., Webster Street, Bradford, Pa., manufacturer of motor tractors, parts, etc., has asked bids on general contract for two-story addition, 35 x 60 ft., to cost about $40,000 with equipment. Hendryx & Benton, Tidewater Building, are architects.

Holgate Brothers Co., Holbros Building, Kane, Pa., manufacturer of broom blocks and kindred products, has awarded general contract to Hyde-Murphy Co., Ridgeway, Pa., for three-story addition, to cost about $70,000 with equipment.

Officials of Randolph Planing Mill Co., Elkins, W. Va., have arranged for change of company name to West Virginia Flooring Co., increasing capital to $350,000. Expansion will be carried out at hardwood flooring mill, including installation of electrically-operated equipment.

National Airways & Aircraft Co., Weirton, W. Va., recently formed by Danzil Martin, Weirton, and associates, is planning establishment of airport in Marland Heights district, including hangars, repair shops and other field units, to cost about $70,000 with equipment. It is proposed to establish flying school later.

Pennsylvania Fireproofing Co., St. Marys, Pa., has awarded general contract to Truscon Steel Co., Youngstown, Ohio, for one-story addition, 40 x 175 ft., to be used in part for storage and distribution, to cost about $50,000 with equipment.

Buffalo

BUFFALO, Oct. 28.—Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, is considering establishment of new plant to manufacture flying boats near Hampton Roads or Norfolk, Va., consisting primarily of assembling and testing works, to cost over $100,000 with equipment. Lawrence D. Bell is general manager.

New York Central Railroad Co., Central Terminal, Buffalo, and 466 Lexington Avenue, New York, has awarded general contract to E. P. Muntz, Inc., Lehigh Valley Terminal Building, for engine terminal with repair and reconditioning facilities at Gardenville, N. Y., to cost about $55,000 with equipment.

Board of Trustees, Cornell University, Ithaca, N. Y., has authorized construction of addition to steam power plant, including smokestack and equipment, to cost $180,000.

Edwin R. Cooney, 762 Crescent Avenue, Buffalo, and associates have organized Cooney Refrigeration Co. and plan early operation of local factory for production of refrigerating equipment and devices. James L. Cooney, 221 Walton Street, Syracuse, N. Y., is interested in new organization.

Harrison Radiator Corporation, Washburn Street, Lockport, N. Y., a subsidiary of General Motors Corporation, is contemplating new plant in Ferndale district, Detroit, to manufacture automobile radiators and kindred automotive products, to cost more than $200,000 with equipment. Site has been purchased.

Universal Wireless Communication Co., Inc., Liberty Bank Building, Buffalo, is arranging for increase in capital from 750,000 to 4,000,000 shares of stock, part of fund to be used for construction of wireless broadcasting and receiving stations. G. Morton Wolfe, 1377 Main Street, is engineer.

Colonial Motor Coach Corporation, 133 West Water Street, Syracuse, N. Y., has plans for a one-story service, repair and garage building, to cost $160,000 with equipment. F. F. Dressler, 140 South Dearborn Street, Chicago, is architect.

Samson-United Corporation, Rochester, N. Y., cutlery manufacturer, has bought local plant of Selden Truck Corporation and has started to equip for its main manufacturing plant. A. O. Samuels is president of Samson-United Corporation.

Detroit

DETROIT, Oct. 28.—Plans are under way by Dare Airplane Co., Detroit, for new aircraft manufacturing plant at Milan, Mich., where 400-acre tract has been secured, large part of site to be developed as airport. Factory unit will be two stories, 80 x 130 ft., for parts manufacture and assembling, to cost about $65,000 with equipment. Executive offices will be maintained at Detroit. F. G. Dunn is vice-president.

Gar Wood, Inc., Algonac, Mich., manufacturer of speed motor boats, etc., will build new plant at Marysville, Mich., where 6-acre tract, with waterfront of 650 ft. on St. Clair River, has been secured through cooperation of Chamber of Commerce. Plans will be drawn for two one-story buildings, 70 x 550 ft. and 70 x 350 ft., to cost more than $100,000 with equipment. Work is scheduled for completion in 90 days. Present plant will be removed to new location.

Board of Trustees, University of Detroit, Livernois Avenue and Six-Mile Road, will soon take bids for two-story addition to engineering building, to cost over $90,000 with equipment. Malcolmson & Higginbotham, 1219 Griswold Street, Detroit, are architects.

Reynolds Spring Co., Jackson, Mich., has purchased Premier Cushion Spring Co., 5171 Bellevue Avenue, Detroit, manufacturer of automobile springs, and will consolidate. It is understood that Detroit plant will be continued. Purchasing company is arranging for increase in capital from 500,000 to 1,000,000 shares of stock, no par value, part of proceeds to be used for purchase and for expansion.

Bennett Pump Co., Muskegon, manufacturer of pumping machinery and parts, is planning one-story addition, totaling about 28,000 sq. ft. floor space, and will have unit ready for occupancy near end of year. Work is under way on another one-story extension providing about 24,000 sq. ft. floor area, entire project to cost about $100,000 with equipment.

Pere Marquette Railroad Co., Grand Rapids, is planning to rebuild local car repair shops and equipment storage and distributing plant destroyed by fire Oct. 18. General offices are in Union Depot, Fort Street, Detroit.

Officials of Consolidated Cabinet Corporation, Greenville, have organized Consolidated Soda Fountain Corporation to take over and expand present organization. Company will use former local plant of Taplin Furnace Co. and remodel for early occupancy. Work on one-story addition will start at once, entire project to cost more than $70,000 with equipment. Company will specialize in production of electrically-operated soda fountains and soda fountain equipment. Harold A. Hawn is president; and E. J. Thome, secretary and treasurer.

Detroit Show Case Co., 1654 West Fort Street, Detroit, manufacturer of show cases, store fixtures, etc., has plans for two-story addition, 60 x 125 ft., to cost more than $60,000 with equipment. B. C. Wetzel & Co., Dime Bank Building, are architects.

American Forging & Socket Co., Pontiac, Mich., will build a larger and more modern plant at a location not yet determined. Because of development of new products, company expects a large expansion in its business during coming year. Directors on Oct. 21 declared a dividend of 35c. a share on common stock, bringing total for year to 80c. a share.

Norge Corporation, manufacturer of electric rotary refrigerators, a division of Borg-Warner Corporation, has moved into Detroit plant of Morse Chain Co., another Borg-Warner subsidiary. It will be in production Nov. 1.

Eclipse Interchangeable Counterbore Co., Detroit, has recently expended $150,000 in adding to its manufacturing space and equipment at 7410 St. Aubin Avenue. A finished stock room has been completed in which a stock of counterboring tools valued at $150,000 is carried. R. G. Mitchell is general manager.

O. L. Anderson Co., Inc., Detroit, manufacturer of metal stampings and gasoline tanks for motor cars and motor boats, has purchased about 65,000 sq. ft. in B. E. Taylor industrial area as site for new plant, for which plans are being drawn.

Cleveland

CLEVELAND, Oct. 28.—Machine tool sales were fair the past week. The volume of business during October will show a gain over September. With some manufacturers, however, it will not be quite up to August. Business is mostly in single tools and is well distributed among various industries except the automotive industry. Automobile manufacturers are not expected to be in the market for much equipment during the remainder of the year. The Hercules Motor Co., Canton, Ohio, is inquiring for a round lot of machine tools for extensions. A fair amount of business is coming from the oil field industry.

Euclid Crane & Hoist Co., Cleveland, has awarded a contract to Truscon Steel Co. for an addition, 47 x 213 ft., one-fifth of space to be used for offices and remainder for manufacturing.

Columbia Metal Stamping & Die Co., Cleveland, has placed contract with J. L. Hunting Co. for a two-story plant, 90 x 200 ft. at Harvard Avenue and East 116th Street.

A 30 acre tract has been acquired by City Machine & Tool Co., Toledo, Ohio, for new plant, to cost more than $150,000 with equipment.

Columbia Metal Stamping & Die Co., 1536 East Forty-ninth Street, Cleveland, has awarded general contract to H. K. Ferguson Co., Hanna Building, for one-story plant unit, 90 x 225 ft., to cost about $100,000 with equipment.

National Washboard Co., 310 South Michigan Avenue, Chicago, is negotiating for purchase of washboard manufacturing works of Monarch Mfg. Co., Tiffin, Ohio, and its affiliated interest, Federal Washboard Co., Tiffin. It is proposed to remove plant to Chicago or other point. Monarch company will be reorganized and will develop local plant for another line of production. Fred C. Cramer is president of Monarch company.

Stahli Auto Body Wagon & Spring Co., 5366 St. Clair Avenue, Cleveland, manufacturer of automobile bodies, springs, etc., is considering one-story addition, to cost more than $40,000 with equipment.

Ric-Wil Co., Barberton, Ohio, manufacturer of door hangers and other hardware products, will build one-story addition, 60 x 80 ft., to cost about $30,000 with equipment.

Sterling Grinding Wheel Co., Tiffin, Ohio, subsidiary of Cleveland Stone Co., Union Trust Building, Cleveland, has awarded general contract to Hossler Brothers, Tiffin, for two one-story additions. Work will be carried out in connection with an expansion program to cost $100,000. George S. Rider Co., Century Building, Cleveland, is engineer.

Curtiss Flying Service, Inc., 39 Broadway, New York, has awarded general contract to A. M. Higley, Plymouth Building, Cleveland, for one and two-story hangar, with repair facilities, at Richmond Heights airport, near Cleveland, to cost about $100,000 with equipment. Kenneth Franzheim, 345 Madison Avenue, New York, is architect.

Milwaukee

MILWAUKEE, WIS., Oct. 28.—Orders and pending business are well distributed throughout the metal-working industries. Automotive demand, however, is falling off, although local manufacturers of automotive parts have not curtailed generally. There is good demand from small machine shops and a revival of activity among makers of woodworking and sawmill machinery with considerable plant expansion projected. Export orders for large tools has increased from northern European countries. Deliveries threaten to become more remote.

Wrought Washer Mfg. Co., 46-54 South Bay Street, Milwaukee, will add three new one-story structures to building, 250 x 450 ft., recently purchased, which will include $150,000 rerolling mill, 65 x 500 ft.; raw material storehouse, 65 x 385 ft., and shipping department building, 100 x 250 ft. Present equipment will be moved and new equipment, including cranes up to 15 tons capacity, added. Washers, stamping tools and dies will be produced at new plant. Fred Doepke, Sr., is president and in charge.

Giddings & Lewis Machine Tool Co., Fond du Lac, Wis., manufacturer of horizontal boring, milling and drilling machines, is planning to have German plants manufacture heavy parts of its machinery for European delivery. Only lighter and intricate parts will be shipped from Fond du Lac under this arrangement. H. B. Kraut, president and chairman of board, and K. F. Gallimore, chief engineer, are en route to Europe.

Pressed Steel Tank Co., Milwaukee, is building one-story addition to plant, 53 x 192 ft., at 5701 Greenfield Avenue, West Allis.

Filer & Stowell Co., 219 Becher Street, Milwaukee, have begun erection of one-story addition, 53 x 107 ft., to cost $12,000.

J. G. Busch Co., 136 Ferry Street, Milwaukee, general machinist, is building shop addition, 31 x 62 ft.

Wausau Iron Works, 738 South Tenth Avenue, Wausau, Wis., snow plow manufacturer and fabricator of structural steel, is erecting an addition, 100 x 148 ft.

Central Chevrolet Agency, Hartford, Wis., has begun construction or garage and service building, two-stories, 74 x 118 ft.

Chain Belt Co., Milwaukee, will handle all foreign distribution of steel tubular towers and masts manufactured by Archer Iron Works, Chicago, which will retain its selling rights for United States and Alaska. Archer line will be sold abroad under Chain Belt Co.'s trade name Rex.

Parker Pen Co., Janesville, Wis., has acquired site at Toronto, for new Canadian plant. Present Toronto plant is leased. Work on the new plant will begin early in 1930.

Chicago

CHICAGO, Oct. 28.—Sales of machine tools are in larger volume, but dealers are still dependent for current business on covering a wide territory and centering on buyers who are seeking individual tools. The Milwaukee road is in the market for a coach wheel lathe, and the general purchasing officer for the Panama Canal Zone will buy a planer, a number of drilling machines, several lathes and miscellaneous mechanical supplies. Farm implement manufacturers are in the market for odd tools, some of which were not purchased when lists were closed earlier in the year. More extensive buying by this industry is said to be near at hand.

Supplies of used machines are more plentiful and demand is large. Dealers from the Pacific Coast are still making purchases in this market.

Uchtorff-Weiser Co., Davenport, Iowa, designer and manufacturer of dies and sheet metal products, will remove from 319 North Howell Street to Independent Products Co. building 209 North Howell Street, where a department for handling general machine repair work will be installed. Manufacture of metal cabinets will be added to company's lines.

Peoples Gas Light & Coke Co., 122 South Michigan Avenue, Chicago, will build a two-story compression building to cost $25,000. R. Schenck, 122 South Michigan Avenue is architect.

Babson Mfg. Co., 2851 West Nineteenth Street, Chicago, manufacturer of barn equipment, dairy machinery, etc., has plans for immediate erection of one-story plant at St. Charles, Ill., to cost about $70,000 with equipment.

Peoria Casket Co., Peoria, Ill., has awarded general contract to C. H. Tapping Construction Co., Jefferson Building, for two-story addition, to cost about $70,000 with equipment. Jameson & Harrison, Peoria Life Building, are architects.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded general contract to W. A. Klinger, Inc., Warnock Building, Sioux City, Iowa, for two-story and basement factory branch, service and sales building at Sioux City, 150 x 225 ft., to cost about $150,000 with equipment.

Peoria Malleable Castings Co., Alexander Street, Peoria, Ill., is considering three-story addition to cost about $45,000 with equipment. It is understood that L. Eugene Robinson, Jefferson Building, architect and engineer, will prepare plans.

Northern Pacific Railway Co., Railroad Building, St. Paul, Minn., has plans for an addition to engine house at Mandan, N. D., with additional repair and machine shop facilities, to cost about $40,000. O. M. Rognan, address noted, is company engineer.

Central Lime & Cement Co., 228 North LaSalle Street, Chicago, has acquired a 7-acre tract on Ninety-fifth Street, heretofore held by American Brake Shoe & Foundry Co., for establishment of storage and distributing plant, to cost more than $100,000 with equipment.

Smith & Richardson Mfg. Co., Geneva, Ill., manufacturer of foundry supplies, etc., has awarded general contract to Wilson Brothers, Geneva, for one-story addition, to cost about $25,000 with equipment.

Midwest Canning Corporation, Rochelle, Ill., is considering construction of new plant at Sleepy Eye, Minn., to cost over $250,000 with automatic canning, conveying, sealing and other equipment.

Great Northern Railway Co., Railroad Building, St. Paul, Minn., is considering steam power plant at Great Falls, Mont., to use pulverized fuel, to cost about $85,000 with equipment. Work will probably begin next year.

Firestone Tire & Rubber Co., Akron, Ohio, has plans for factory branch, service and distributing plant at Chicago, where site, 107 x 174 ft., has been acquired, to cost about $150,000 with equipment. Harold E. Gallup, 646 North Michigan Avenue, Chicago, is architect.

Royer Mfg. Co., Janesville, Wis., has leased, with option to buy, Caward-Dart building, Waterloo, Iowa, containing 20,000 sq. ft. floor space, for production of its Hawkeye maintainer and road equipment. Janesville plant will be continued for production of concrete mixers. Operations in Waterloo plant will start about Jan. 1.

Rockford Die & Tool Works, Rockford, Ill., has been incorporated with $75,000 capital, and will establish plant at 1816 Seventeenth Avenue containing 5000 sq. ft. factory space. C. A. Dahlberg, J. R. Jernberg and A. F. West are organizers. Mr. Dahlberg has recently been elected president of Rockford Stamping & Tool Co.

Mattson Mfg. Co., will start work at once on branch factory at Manchester, Iowa, to extend its facilities in manufacture of highway snow fences. Company operates plants at Williamsport, Pa.; Joliet, Ill., and St. Paul, Minn.

Indiana

INDIANAPOLIS, Oct. 28.—Indiana & Michigan Electric Co., West Colfax Street, South Bend, has awarded general contract to H. G. Christman Co., 306 Notre Dame Avenue, for one-story addition to equipment storage and distributing plant, including repair division and remodeling of power house unit, to cost about $80,000 with equipment.

Lilly Varnish Co., 670 South California Street, Indianapolis, has awarded a contract to Mothershead & Fitton, 960 North Pennsylvania Street, for one-story addition to raw material grinding mill, to cost about $40,000 with equipment.

Studebaker Mail Order Co., South Bend, operating Colin B. Kennedy Corporation, manufacturer of radio equipment and other interests, has purchased substantial interest in Marvin Radio Tube Corporation, Irvington, N. J., manufacturer of radio apparatus, with four factories in East and plant at Chicago. Plans are under way for a consolidation of plants at South Bend, where production will be concentrated and expanded. F. H. Wellington is vice-president and treasurer of purchasing company.

Board of Education, Terre Haute, is considering installation of manual training equipment in two-story addition to McLean Junior High School to cost $200,000, for which bids will soon be asked on general contract. George J. Stoner & Co., Inc., Chanticleer Building, is architect.

Board of Trustees, Indiana Soldiers and Sailors Orphans' Home, Knightstown, has plans for new power house for central service, to cost about $60,000 with equipment. McGuire & Shook, 941 North Meridian Street, Indianapolis, are architects.

Rubush & Hunter, American Central Life Building, Indianapolis, architects, have awarded a general contract to A. V. Stackhouse Co., 2611 Cornell Avenue, for seven-story and basement automobile service, repair and garage building, 68 x 200 ft., to cost more than $400,000 with equipment.

Servel, Inc., Evansville, manufacturer of electric and gas-operated refrigerating equipment, is arranging for increase in capital from 1,600,000 to 2,000,000 shares of stock, no par value, part of proceeds to be used for expansion in output. Company has purchased manufacturing rights for Electrolux refrigeration system.

Highland Iron & Steel Co., Terre Haute, is planning construction of new mill, 120 x 400 ft., to manufacture wrought iron window frame sections, to cost about $150,000. Work will probably start early next spring.

Cincinnati

CINCINNATI, Oct. 28.—Demand for machine tools in this district increased the past week, dispelling the quietness that has prevailed recently. New business was well diversified, but orders were mostly for one or two standard machines. Production is being well maintained at capacity and in many instances factories are working night shifts in an effort to catch up on unfilled orders. Inquiries have also increased, with special tools in greater demand than heretofore. An unnamed buyer is inquiring for six planers.

The Russian Government placed an order the past week with a local builder for 26 lathes of various sizes. This inquiry has been pending for sometime, following a tour of inspection by a Russian commission early last summer.

Delco Products Co., 329 East First Street, Dayton, Ohio, manufacturer of isolated electric-lighting plants, automobile lighting and starting equipment, etc., has awarded general contract to Charles H. Shook, Third National Bank Building, for seven-story plant, to cost $200,000 with equipment.

City Council, Middletown, Ohio, is considering a municipal airport, with hangar, repair shop and other field buildings, to cost about $120,000 with equipment. City engineering department, City Hall, will be in charge.

Hill Auto Body & Metal Works, Inc., 822 Reedy Street, Cincinnati, is contemplating new one-story plant near Lunken municipal airport, to cost over $40,000 with equipment.

Universal Steam Motors, Inc., Guaranty Bank Building, Lexington, Ky., John R. Humphrey, president, is planning construction of new one-story plant, including divisions for parts production and assembling, to cost over $85,000 with equipment. It is expected to begin work early next year. George W. Hadden is general manager and chief engineer.

Dealers' Equipment & Implement Co., 1434 Riverside Avenue, Memphis, Tenn., farm and agricultural equipment, tools, etc., has plans for a one-story storage and distributing plant, 60 x 315 ft., to cost about $30,000 with equipment. R. H. Rust is general manager.

Board of Education, Delaware, Ohio, is considering installation of manual training equipment in two-story high school to cost $300,000, for which bids have been asked on general contract. Glass & Ramsey, 186 East Broad Street, Columbus, Ohio, are architects.

Procter & Gamble Co., Gwynne Building, Cincinnati, has plans for a steam power house at its St. Bernard plant, to cost about $65,000 with equipment.

Clarksville Aviation Corporation Clarksville, Tenn., Collier W. Goodlett, president, has plans for hangar, 80 x 100 ft., with repair facilities, to cost about $50,000 with equipment.

Tipton County Board of Education, Covington, Tenn., has approved plans for two-story vocational and agricultural building at Byar-Hall high school, to cost about $70,000 with equipment. Anker F. Hansen, Shrine Building, Memphis, Tenn., is architect.

Gulf States

BIRMINGHAM, Oct. 28.—American Can Co., 602 North Cortez Street, New Orleans, has taken out a permit for a one-story addition, to cost about $30,000 with equipment.

Texas & Pacific Railroad Co., Dallas, Tex., has work under way on ice-manufacturing plant at Lancaster yards, Fort Worth, Tex., to cost about $200,000 with equipment.

Central Texas Refining Co., Dallas, Tex., a subsidiary of Cranfill-Reynolds, Inc., 1013 Commerce Street, Dallas, is contemplating new oil storage and distributing plant, to cost about $45,000 with equipment.

Crane Co., 836 South Michigan Avenue, Chicago, has plans for three-story factory branch, storage and distributing plant, 100 x 105 ft., at Jacksonville, Fla., to cost more than $80,000 with equipment. Marsh & Saxelby, Consolidated Building, Jacksonville, are architects.

Southern United Ice Co., McComb, Miss., has plans for extensions and improvements in plant, including installation of electrical equipment to replace present steam-operated machinery, entire project to cost more than $50,000. Eugene Loch is local manager, in charge.

Laredo Truck & Implement Co., Laredo, Tex., recently organized by W. C. Lonquist, Laredo, and associates, plans storage and distributing plant, with repair and service department, to cost over $40,000 with equipment.

Pan-American Aero Corporation, San Antonio, Tex., recently organized by Joseph Palmer, San Antonio, is negotiating with local Chamber of Commerce for site for local plant to manufacture air planes and parts, largely tri-motored passenger aircraft, designed by Mr. Palmer, to cost more than $65,000 with

equipment. E. A. Reilly, San Antonio, is interested in new organization.

St. Louis-Southwestern Railway Co., Tyler, Tex., will soon begin construction of one-story car repair shop at local yards, to cost about $40,000 with equipment. W. S. Hanley is chief engineer.

Board of City Trustees, Lafayette, La., is planning extensions and improvements in municipal electric light and power plant, including installation of new engine unit and auxiliary equipment. J. Frank Ard is chief engineer, in charge.

Dallas Power & Light Co., Dallas, Tex., has work under way on extensions and improvements in steam-operated electric generating plant, with installation of additional equipment, to cost more than $1,000,000 with transmission lines.

International Flying Service, Inc., 521 Ingraham Building, Miami, Fla., is planning erection of several hangars at local airport, with shop and reconditioning facilities, units to be 100 x 100 ft., to cost about $75,000 with equipment. Edward O. Smith is company engineer.

Board of Education, Hattiesburg, Miss., is planning installation of manual training equipment in new junior high school to cost about $275,000, for which bids will be asked on general contract in about 30 days. Hull & Malvaney, Merchants Bank Building, Jackson, Miss., are architects.

Southern Air Transport, Inc., Fort Worth, Tex., will soon begin construction of two hangars, repair shops, oil storage and other field units at Grosvenor Field, near San Antonio, Tex., to cost more than $100,000 with equipment. Company engineering department is in charge.

St. Louis

ST. LOUIS, Oct. 28.—Woods Brothers, Inc., 407 Security Building, Kansas City, Mo., manufacturer of airplanes and parts, has engaged Charles A. Smith, Finance Building, architect, to prepare plans for one-story plant at Rosecrans Field, St. Joseph, Mo., including parts manufacture and assembling departments, to cost about $55,000 with equipment.

Thomas Poultry Car Co., a subsidiary of North American Car Co., 327 South LaSalle Street, Chicago, manufacturer of railroad cars, has leased property, 75 x 500 ft., at Springfield, Mo., for branch plant, including repair department, to cost about $90,000 with equipment.

Pittsburgh Equitable Meter Co., Kennedy Building, Tulsa, Okla., with headquarters at 400 Lexington Avenue, Pittsburgh, manufacturer of gas and water meters, parts, etc., has plans for one-story factory branch and distributing plant, 50 x 150 ft., to cost about $50,000 with equipment. Rush, Endacott & Goff, New Wright Building, Tulsa, are architects.

McCarthy Chevrolet Co., 6320 Delmar Boulevard, St. Louis, local representative for Chevrolet automobile, has acquired property, 110 x 185 ft., as site for new two-story service, repair and sales building, to cost over $100,000 with equipment.

Board of Education, Coffeyville, Kan., is considering installation of manual training equipment in two and three-story high school, 185 x 390 ft., to cost $400,000, for which bids will be asked on general contract early in November. Glen H. Thomas, Wheeler-Kelly-Hagny Building, Wichita, Kan., is architect.

Famo Feed Milling Co., 429 Cherokee Street, St. Joseph, Mo., has leased grain elevator to be erected by local interests and will install conveying, hoisting, screening and other mechanical equipment, to cost about $50,000. Horner & Wyatt, Board of Trade Building, Kansas City, Mo., are architects and engineers.

City Council, Russellville, Ark., has plans for new municipal electric light and power house, including installation of three Diesel engines, generators and accessory equipment, to cost about $200,000 with machinery; fund has been approved. W. L. Winters, Merchants' National Bank Building, Fort Smith, Ark., is engineer.

Piston Ring Castings Co., Inc., St. Louis, recently formed by Henry Haacke, 5544 Maze Place, and associates, is arranging for new local plant to manufacture piston rings for automobile engines, etc., to cost about $80,000 with machinery. Mr. Haacke will be president of new organization.

Pacific Coast

SAN FRANCISCO, Oct. 24.—Reliance Truck & Trailer Co., 1217 Stanyan Street, San Francisco, has filed plans for one-story plant, to cost about $25,000 with equipment.

United States Electrical Mfg. Co., 200 East Slauson Avenue, Los Angeles, manufacturer of motors and other electrical equipment and supplies, has engaged Hamm, Grant & Bruner, Inc., Ferguson Building, architect and engineer, to prepare plans for one-story addition, 140 x 150 ft., to cost about $60,000 with equipment.

Compton Union High School District, Compton, Cal., has authorized construction of a vocational shop at new high school group at Clearwater, to cost about $125,000. Frank M. Goodwin, Stockwell Building, Compton, is architect. A similar shop unit will be constructed at high school group to be located at Willowbrook, to cost close to like amount, for which plans will be prepared by same architect.

General Electric Co., Schenectady, N. Y., has acquired 50-acre tract near San Carlos, San Mateo County, Cal., and is considering new plant for Pacific Coast trade, to cost more than $1,000,000. Company is now operating two plants at Oakland, Cal. James A. Cranston is Pacific Coast manager.

Board of Public Works, Oakland, Cal., has plans for one-story municipal machine and repair shops, 200 x 200 ft., to cost about $75,000 with equipment. L. C. and D. D. Stone, Great Western Power Building, Oakland, are architects.

General Electric Supply Co., Los Angeles, has leased a two-story building to be erected at Long Beach, Cal., 46 x 120 ft., and will use for equipment storage and distributing plant, to cost about $25,000. W. Horace Austin, Pacific Southwest Bank Building, Long Beach, is architect.

Washington Electric Co., Seattle, a subsidiary of Puget Sound Power & Light Co., has secured Federal permission for hydroelectric power project on Columbia River, near Wenatchee, Wash., to develop total capacity of 84,000 hp., to cost about $10,000,000 with steel tower transmission system and substations. Work is scheduled to begin soon. A. W. Leonard is president.

Hamilton Aero Mfg. Co., Los Angeles, has awarded general contract to Austin Co. of California, Inc., for one-story aircraft manufacturing plant at United Airport, Burbank, with parts and assembling departments, to cost about $27,000 with equipment.

Shaffer Tool Works, Brea, Cal., is erecting one-story addition to local plant, to cost about $25,000 with equipment.

City Council, Fallon, Nev., is considering municipal electric light and power plant, to cost about $100,000 with equipment. Work will be in charge of city engineering department.

Foreign

PLANS are under way by E. F. Houghton & Co., 240 West Somerset Street, Philadelphia, manufacturer of industrial oils, greases, etc., for new plant near Birmingham, England, to cost about $100,000 with equipment. George Edwards, managing director, Edgar Vaughan & Co., Birmingham, British sales agents and distributers for Houghton company, will be active in new plant.

Edison General Italian Electric Co. (Societa Generale Italiana Edison di Elettricita), Milan, Italy, has arranged for increase in capital from $57,750,000 to $70,875,000, part of proceeds to be used for expansion, including hydroelectric power developments and transmission line construction. A block of 140,000 shares of stock will soon be placed on market in United States.

Opel Motor Car Works, Russelheim, Germany, controlled by General Motors Corporation, Detroit, is planning expansion, including facilities for production of new type of car. It is said that parent company will expend more than $1,000,000 for development of plant. I. J. Reuter, heretofore president and general manager of Olds Motor Works, Inc., Lansing, Mich., a division of General Motors Corporation, has been appointed managing director of Opel works.

United Sugar Co., Los Mochis, Mexico, has authorized expansion program to cost about $500,000, including new units at cane sugar mill and installation of equipment for large increase in capacity.

Kreuger & Toll Co. (Aktiebolaget Kreuger & Toll), Stockholm, Sweden, operating Swedish Match Co., controlling International Match Co. and affiliated interests, and identified with Grangesberg Co., Stockholm, with extensive iron ore properties, is arranging for increase in capital covering a bond issue of 37,916,660 kroner (about $9,480,000) and stock issue of 10,833,400 kroner (about $2,710,000), a considerable part of fund to be used for acquisition of lumber and pulp-wood properties in northern Sweden, comprising several going plants. Extensions will be carried out in last-noted line for wood supply for match interests and for pulp-wood production for other lines.

New Trade Publications

Twist Drills.—New Process Twist Drill Co., Taunton, Mass. Catalog No. 29, listing dimensions and prices of hot-forged carbon and high-speed steel twist drills, bonding drills, track bits, jobbers drills, wire gage drills and other types. Manufacture of these drills is illustrated; useful information includes the proper grinding of drill points.

Turret Lathes and Balancing Machines.—Gisholt Machine Co., Madison, Wis. Service bulletins Nos. 1-15, with binder, describing and illustrating various production set-ups on the tur-

ret lathes and other machines built by the company. Bulletin No. 9, for example, shows an unusual forged-steel flywheel job on the Simplimatic, while others picture the machining of large elevator sheaves on the No. 4-L turret lathe and the cutting threads and other operations on airplane engine cylinders on the No. 1-L lathe. A five-position fixture for machining gate valves at one chucking on the Gisholt 3AL lathe is another job shown. The bulletins are issued at intervals.

Automatic Chucking Machine.—Goss & DeLeeuw Machine Co., New Britain, Conn. Eight-page folder illustrating and describing the new Quad-Radial work-rotating chucking machine, which combines a number of new features that exploit the possibilities of tungsten carbide cutting tools. Large illustrations show various details of the machine which was brought out at the Machine Tool Show and described in THE IRON AGE of Sept. 12.

Ball Bearing Manual.—Gurney Ball Bearing Division, Marlin-Rockwell Corporation, Jamestown, N. Y. Second edition of condensed handbook, 202 pages, 5 x 7½ in., intended to aid engineers in the selection and application of Gurney ball bearings. Dimensions and list prices are given on single row, radio thrust, duplex, double row and other types of ball bearings such as clutch throw-out, adapter type, narrow type and extra small radial bearings. A section is also devoted to thrust bearings. Engineering data include information required for computing loads on bearings, formulas for bearing loads, safety factors, limiting speeds, and the selection of type and size of bearings.

Squirrel-Cage Motors.—Louis Allis Co., Milwaukee. Bulletin 508 of 12 pages illustrates and describes a line of explosion-proof self-ventilated squirrel-cage motors of ¼ to 25 hp. designed for individual motor drive in hazardous industries. Illustrations include a number of installation views where there is an explosive atmosphere.

Electroplating Generator.—Columbia Electric Mfg. Co., 1292 East Fifty-third Street, Cleveland. Bulletin of 16 pages, illustrating and describing motor-generator sets for electroplating, electrotyping and electrochemical processes. These are made with ampere ratings from 300 to 10,000. Motor and generator are mounted on a common base and have flexible coupling.

Firebrick.—Laclede-Christy Clay Products Co., St. Louis. Folder of 4 pages referring to the 85 years of activity of this company, and showing some happenings in 1844, at the time the company was founded.

Electric Control Apparatus.—Allen-Bradley Co., Milwaukee. Four-page bulletin 740, devoted to a starting device for squirrel-cage motors in industrial use.

Motor Drives for Rolling Mills.—General Electric Co., Schenectady, N. Y. Bulletin 151-B of 64 pages lists motors supplied by this company for driving main rolls, to a total of 767 units, rated at 1,105,490 hp. The list is divided into groups according to type of mill and drive and the illustrations show a number of the units as installed.

Japanning, Enameling and Baking Ovens.—Despatch Oven Co., Minneapolis, Minn. Revised bulletins featuring gas and electric ovens for high-speed baking and drying of finishes of all kinds have been published.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

STOCKS declined violently in "speculators' panic," halted on worst day only by organized buying of representative issues by leading New York banks. Bonds, however, move to higher levels, and money rates are steady.

* * * * *

WHEAT declined 8c. during a week of rapid and disorderly selling. The Federal Farm Board, convinced that prices are lower than the world's supply of grain warrants (this year's harvest is 500,000,000 bushels smaller than last), has placed $100,000,000 at the disposal of Farmers' National Grain Corporation, to insure that any grower can borrow a total of $1.15 per bushel on grain delivered to cooperative elevators.

* * * * *

COTTON has received similar support which virtually pegs the price at about 16c. . . . A downward trend of most agricultural prices began early in October, responsive to heavy shipments and liberal stocks in storage. . . . Corn prices are firm.

* * * * *

BUSINESS generally is on a sound basis, President Hoover said, since commodity prices are stationary and inventories low despite a high rate of production and consumption and an upward trend in wages . . . Retail trade is somewhat slower, wholesale and jobbing trade is fairly well maintained, and industry is improved, when compared with last week, although most lines are moderately slower than a year ago.

* * * * *

HEAVY engineering contracts totaled $60,000,000, only two-thirds of corresponding week last year. However, structural fabricators are operating at practical capacity and shipyards are busiest since the war. . . . The Pennsylvania Railroad will extend its electrified zone south to Baltimore, but also has ordered 100 large steam locomotives for fast freight service.

* * * * *

INLAND waterways, intercoastal canals and St. Lawrence ship canal should be developed as a coordinated system, said President Hoover, during the celebration of the completion of the 9-ft. stage on the Ohio River. The annual cost of a 10-year program, in addition to current expenditures on rivers and harbors, will be about equal to half the cost of a battleship.

* * * * *

NINE fast trans-Atlantic liners are projected by six nations, the total cost being $180,000,000. F. C. Munson, president Munson Steamship Lines, calls this wasteful and uneconomic, as compared with what the same sum would do toward improving existing ships. . . . Freighters belonging to U. S. Shipping Board cut costs of voyage one-third by using cheap coal, pulverized. . . . Sale of operating lines and laid-up ships enables Government-owned Merchant Fleet Corporation to reduce next year's budget $4,000,000. . . . The Russian ice-breaker Krassin returns with a convoy of 26 vessels from a 104-day cruise to Kara Sea, to trade with posts in northern Siberia.

* * * * *

FLYING records were broken by the Do-X. Its 12 500-hp. motors carried it for an hour 1200 ft. above Lake Constance, Switzerland, with 169 persons seated in a three-galleried fuselage and within the wings. . . . General Motors organizes a subsidiary to build such all-metal flying boats under Dornier license. . . . A Soviet-built plane arrives in the United States after an eventful trip from Russia. Another flies across the Himalayas on the Afghan border at an elevation of 17,500 ft. and temperature 70 below. . . . Air mail reaches New York from Buenos Aires, via west coast of South America, in 11 days, six days shorter than the fastest ship and rail time.

* * * * *

INDEPENDENT cigar makers and packers form an association to purchase raw materials and modern manufacturing machinery, as well as to conduct a national advertising campaign. . . . Paper and pulp industry in Wisconsin finances a graduate school at Lawrence College for advanced technical training, industrial research, and informational service on paper products. . . . A $125,000,000 holding company acquires control of Kraft-Phenix Cheese Corporation, Hershey Chocolate Corporation and Colgate-Palmolive-Peet Co.

* * * * *

PETROLEUM production remains near its peak figure, despite a 20-per cent voluntary restriction by Oklahoma producers. . . . California crude was reduced about 75c. per barrel, since the gas conservation law did not restrict the production of oil as expected. In that State 800,000,000 cu. ft. of natural gas is blown into the air daily, twice as much as is used. . . . Utilization of natural gas is increasing throughout the country at the rate of 8 per cent a year; 4,500,000 customers now use it for fuel.

THE IRON AGE

A Revolution in Machinery Design

Affecting Industrial Machinery Particularly, It Represents a Breaking with Tradition and Is Economic Rather Than Technical

BY WALTER STUART KELLEY*

OUR industrial age is by no means past; in fact, it appears about to take a new lease of life because of epochal changes that can now be forecast. The industrial characteristics of the nineteenth century, however, are beginning to be less evident as factors in shaping social development. Evidence is apparent that economic values are shifting, that a new appraisal is close at hand. New factors are shaping that will accentuate and hasten the action of present tendencies toward low cost production and its invariable concomitant, higher wages.

Since time immemorial, power, whether it was ox-power, horse-power, water-power, steam-power, or the first of all, man-power, has been used to make machinery productive. Note clearly this fact: it is power that makes a machine productive, regardless of whether it be humanly directed, or automatic in its operation. The machine itself is powerless to produce. This point is emphasized as it affords a clue to what follows.

It has been necessary in the past to apply power in a stereotyped manner, after a certain inescapable fashion. Because of this fact and the handicaps inseparable from it, machines as now built will in retrospect appear clumsy and inefficient, therefore expensive to build and to operate. To overcome the mechanical handicaps so far as humanly possible has been the province of the designer and the inventor.

Two considerations, one objective and one subjective, have determined the type, or character, mechanically of any machine, of every machine. The latter has not changed, it has been invariable since machinery, as we now know it in industry, was first made. This was because of a fixed, inescapable condition, that is, the character of the

*Consulting engineer, Boston. Mr. Kelley draws from an experience in mechanical design dating from about 1890 and in electrical design from 1906, becoming chief engineer in that year of an electrical manufacturing company.

Electricity Will Be Responsible for This Century's Advancement

TO orient to readers the sweeping character which he ascribes to the new epoch in machinery construction, Mr. Kelley contributed the following historic background:
